Akkadian, again, continued, after the final collapse of 'the Realm of the Four Quarters', to be used as a medium of diplomatic intercourse, commerce, and culture, not only within the former frontiers of the now defunct Sumeric universal state, but also in regions never ruled by either Hammurabi or Ur-Engur, and never even trodden by the great Akkadian war-lords of an earlier age, a Sargon or a Naramsin. In the fourteenth century B.C. the Akkadian language and script were being employed in the archives and libraries of Hittite Kings at Boghazqal'eh, and, *mirabile dictu*, in the correspondence between the Imperial Government of Egypt and its client princes in its own dominions in Syria, as well as in its transactions with such independent Powers as Khatti and Mitanni. A comparable triumph was achieved by the French language after the meteoric rise and fall of the Napoleonic Empire. In the nineteenth century of the Christian Era, French not only retained the role—which, under the *Ancien Régime*, it had already captured from Latin—of serving as the diplomatic language of the Western World; in the less superficial role of a culture-language it now also found new worlds to conquer in the successor-states of a defunct Spanish Empire of the Indies and in an Ottoman Empire that was rapidly going the Spanish Empire's way.¹

An even more remarkable resilience was shown by Aramaic when, upon the overthrow of the Achaemenian Empire by Alexander, it was brusquely deposed, in favour of the Attic *koinê*, from the official status that the Achaemenidae had conferred on it in their western dominions. Deprived of the imperial patronage which it had enjoyed for two centuries, the Aramaic language succeeded, by the first century of the Christian Era, in completing the process, which it had begun without imperial patronage in the eighth century B.C., of supplanting Akkadian on the east and Canaanite on the west as the living language of the entire Semitic-speaking population of 'the Fertile Crescent'.² And, likewise on the strength of its own unaided merits, the Aramaic Alphabet achieved far wider conquests. In A.D. 1599, within less than two thousand years of the Achaemenian Empire's downfall, it was adopted for the conveyance of the Manchu language on the eve of the Manchu conquest of China.³

This diffusion of the Aramaic Alphabet was a technological and intellectual conquest which surpassed in its sweep the military and political conquests of the Mongol and Arab herdsmen-warriors, but the ultimate victors in this field were the higher religions which sped the Aramaic Alphabet on its way by taking it into their service. In its 'Square Hebrew' variant it became the vehicle of the Jewish scriptures and

¹ In the Ottoman Empire the way had been prepared for the entry of French by the previous currency of the philologically germane Tuscan *koinê* known as the *Lingua Franca*; and no doubt the adoption of French as the culture-language of Hispanic America was similarly facilitated by the kinship between French and the two locally current Romance languages: Spanish and Portuguese.

² See V. v. 499.

³ See V. v. 500, with n. 6.

liturgy; in an Arabic adaptation of its Nabataean variant it became the Alphabet of Islam; in its Syriac variant it served impartially the two antithetic heresies of Nestorianism and Monophysitism into which Christianity polarized itself south-east of Taurus; in an Avestan adaptation of its Pehlevi variant it enshrined the sacred books of the Zoroastrian Church; in a Manichaean adaptation it laboured for a heresiarch whom Christians and Zoroastrians agreed in execrating; in a Kharoshthi variant it provided the Emperor Açoka with an instrument for conveying the teachings of the Buddha to his subjects in the former Achaemenian province in the Panjab.¹ This latter-day ecclesiastical use of the Aramaic Alphabet had given it an abiding place in history which it would never have won from its ephemeral secular canonization as one of the official scripts of the Achaemenian Empire; and, in this point, its fortunes were by no means peculiar.

In like manner the Latin and Attic Greek official languages and alphabets of the Roman Empire had won their place in history as the liturgical, theological, and administrative vehicles of the Roman Church in the West and the Greek Church in Orthodox Christendom,² while the Neo-Sanskrit official language of the Gupta Empire had justified its resurrection by providing a literary medium for both Hinduism and the Mahāyāna.³ Even the Emperor Ts'in She Hwang-ti's mighty deed of standardizing the Sinic characters might live to be remembered, not for the service that it had done to ethics and politics by providing the Confucian School of Philosophy and the imperial civil service with a common instrument of literary expression, but for its service to religion in preserving in translation certain indispensable scriptures of the Mahāyāna that were no longer extant in the original Sanskrit. The Incas' pedagogic imposition of compulsory Quichuan on their long-suffering subjects would perhaps similarly be commemorated by these pagan Andeans' Catholic Christian descendants for its unintended assistance in furthering the propagation of Christianity in the New World. And it could be predicted that the Buddha's devoted exponent, the Emperor Açoka, would continue to win the blessings of Pāli-reading Hīnayānian Buddhists for his deliberate adoption of the living languages of his subjects as the media for his inscriptions.⁴

2. Law

The Three Provinces of Law

The field of social action which is the domain of Law divides itself into three great provinces: there is an administrative law that lays down the duties of subjects towards a government, and there are a criminal and a civil law, which are alike concerned with acts in which both parties are private persons, but which nevertheless differ, from a government's point of view, in the degree to which they affect governmental interests.

No government, of course, can be indifferent to administrative law;

¹ See V. v. 500-1, and p. 250, above.

² For the enlistment of a Neo-Attic Greek language, reconstructed by pagan Hellenic archaists, in the service of the Greek Church, see V. vi. 77-78.

³ See *ibid.*

⁴ See V. v. 498 and V. vi. 76, and p. 251, above.

indeed, it is no exaggeration to say that this province of law is bound to have priority over any government's other concerns; for the first concern of a government is to keep itself in existence; it cannot exist if it does not effectively impose its authority on its subjects by preventing or repressing all those acts of insubordination—ranging from high treason to arrears in the payment of taxes—in which a subject may show himself recalcitrant to a government's will; and the enforcement of governmental authority requires the formulation and execution of a body of administrative law. The same considerations lead governments, in so far as they have the strength, to concern themselves with the criminal law as well; for, though the criminal may not be attacking his government's authority intentionally or consciously in his assaults upon the life, limb, or property of his fellow subjects, he is in fact trespassing on the government's preserves by arrogating to himself, without official licence, a use of force which the Government must jealously preserve as its own monopoly if it is to maintain its authority intact. It will be seen that, in concerning itself with the criminal as well as with the administrative law, a government is primarily actuated by the motive of self-preservation, and for this reason there is in these two provinces of law a close approach to uniformity in the practice of all governments of both the parochial and the universal type. On the other hand, as far as they concern themselves with civil law, governments are acting for Society's and the individual's benefit more directly than for their own; and accordingly we shall not be surprised to find an empirical survey here revealing wide differences in the practice of those universal states which are our subject in the present Part of this Study.

Instances of Failure and Success in Attempts to impose a Uniform Imperial Law

In the domain of law, universal states, by reason of their historical role and their social function, are faced by a special problem of their own which does not confront parochial states—or, at any rate, not ordinarily in so extreme a degree. Universal states do not start life with a clean slate, and they have not time to work out the development of their institutions gradually. They usually establish themselves in place of their parochial predecessors abruptly, as an emergency measure for forestalling a now imminent social collapse. But those predecessors do not perish without leaving—in the domain of law, as in other fields of social action—a legacy with which their destroyer and successor has to reckon.

There had been at least one instance in which the empire-builders had been so abysmally inferior in culture to their conquered subjects that they had found themselves unable to impose on these any part of their own ancestral law. When the Mongols gave the Chinese main body of the Far Eastern Society its universal state and also roped into their empire both a nascent Iranic Muslim Society and a Russian offshoot of the main body of Orthodox Christendom, their leader Chingis Khan naïvely imagined that the legislator's pen would be as puissant an instrument in his hand as the conqueror's sabre.

“The Great Yasa” was . . . made obligatory on all, including the head

of the Empire, the Khāqān, himself. . . . He drew this immutable law neither from the institutions of the more civilised nations with which he came in contact . . . nor from the revelations of a supreme spirit . . . but from the ancient traditions, usages and ideas of his clan and of his nation. He was convinced that . . . he had established eternal norms, good for all time. But . . . "the Great Yasa" has ceased to be law, and the modern Mongols have lost all recollection of it."¹

A fortiori, this Nomad code failed to supersede the existing laws of the Mongol Khāqān's sedentary subjects, and, even when it came into head-on collision with them, it did not prevail, though it had the Mongol sword to back it. It conflicted, for example, with the Islamic *Shari'ah*² by prohibiting the washing of hands in running water and by laying down an incompatible ritual procedure for the slaughtering of cattle. Chingis himself recklessly attempted to ride roughshod over the *Shari'ah* by making it a capital offence to slaughter cattle in the Muslim fashion;³ but, instead of thereby breaking-in for himself submissive subjects, he found himself inspiring defiant martyrs. This deliberately savage and provocative ordinance was revived by Chingis' successor Qubilāy (*imperabat* A.D. 1259-94)⁴ and was not only inflicted on the Muslim diaspora in the Khāqān's own personal domain in Eastern Asia, but was also applied in the Transoxanian subject territories of the Appanage of Chaghatāy,⁵ and in the dominions of the Il-Khan Arghūn (*regnabat* A.D. 1284-91)⁶ in Iran and 'Irāq, where the Muslims constituted an overwhelming majority of the sedentary population. Yet this third Mongol persecution of Islam⁷ was no more successful than its predecessors; and this defeat of the *Yāsāq* by the *Shari'ah* was typical of the *Yāsāq*'s fortunes in all the Mongols' immense possessions.⁸

The 'Osmanlis—who, unlike the Mongols, found a long-enduring solution for the problem of stabilizing a Nomad empire over a sedentary population⁹—not only dealt summarily with high treason and firmly with the collection of taxes, but also took care to keep in the Ottoman Imperial Government's own hands the administration of the criminal law—to whatever *millet* the criminal or his victims might belong—with the sole, though portentous, exception of the members of the Pādishāh's slave-household, who had extorted from Sultan Bāyezīd II (*imperabat* A.D. 1481-1512) the privileges of being exempted from the jurisdiction of the courts of the Muslim community and of being made amenable exclusively to the judgement of their own officers.¹⁰ On the other hand,

as we have seen,¹ the Ottoman imperial authorities showed an equal concern to avoid being implicated in the administration of the civil law, for which the 'peculiar institution' of the Pādishāh's slave-household could not be made to serve as an instrument.

In this province of law the slave-household's only positive concern was its insistence upon enjoying a communal autonomy of its own. As far as other Ottoman Muslims were concerned—apart from the Seyyids (i.e. reputed descendants of the Prophet Muhammad), who enjoyed the privilege of communal autonomy, like the members of the Pādishāh's slave-household²—the 'Osmanlis not only conformed to the traditional practice of their adopted Islamic Faith by leaving all matters of civil law to be administered in accordance with the *Sharī'ah* by the Islamic ecclesiastical courts under the authority of the Sheykh-el-Islām; they took the logical further step—which had been taken by other Muslim governments before them, but had never, perhaps, before been carried out so systematically—of granting the same autonomy, on the same ecclesiastical basis, to the non-Muslim communities under their rule. Indeed, they showed an injudiciously light-hearted consistency in conferring corresponding powers on the foreign colonies of Frankish business men of divers nations whom they permitted to reside in the chief commercial centres of their empire—and thereby opened a chink in the curtain-wall of the Ottoman imperial fortress which was eventually to be enlarged into a breach by the lusty application of Frankish diplomatic and military levers.³

Thus in the province of the civil law the tendency in the Ottoman Empire was for an initial diversity to become increasingly accentuated with the passage of time, but in this point Ottoman history would appear

¹ The Ottoman institution of *millet*s has been touched upon on pp. 244-5, above, *d' propos* of its linguistic aspect. See further IX. viii. 184-6.

² See Lybyer, *op. cit.*, pp. 206, 207, and 216.

³ Though the name 'capitulations', by which these Ottoman charters to colonies of resident aliens came to be known, meant simply 'articles' and not, of course, 'terms of surrender', they did in fact have the effect of putting the Ottoman Empire at the mercy of the Frankish Powers in the latter days of the Empire's weakness. In origin these instruments were unilateral acts by which the Sublime Porte conferred on Frankish Christian residents the same right to administer their own civil affairs that it granted to its non-Muslim subjects. The 'capitulations' were inspired by the same motive of disinclination towards undertaking the distasteful task of administering the affairs of infidels in a field that did not appear to touch the security either of Islam or of the Ottoman State. Moreover, the 'capitulations', as well as the *millet*s, had been a going concern in the parochial states whose place the Ottoman Empire had taken. They had originally been granted by the Western Christian Crusader successor-states of the Abbasid Caliphate to colonies of business men from Venice, Genoa, Pisa, Amalfi, and other medieval Italian city-states, and the practice had spread thence both to the dominions of the Egyptian Mamlūks and to the Orthodox Christian successor-states of the East Roman Empire. It was thus easy to understand how the 'Osmanlis slipped into their error of conferring 'capitulations' not only on the old-established Venetian and Genoese residents but on the French, Dutch, and English who now came bustling in at the Italians' heels. The error lay in failing to perceive that the analogy between charters granted to 'millet' consisting of Ottoman subjects and 'capitulations' conferred on resident colonies of the subjects of foreign Powers was one of form without being one of substance. The essential difference was that, in the second case, the rights and powers were accorded, not to Ottoman subjects, but to foreign governments who, unlike the *millet-bāshī* of the *Millet-i-Rum*, were not in the Pādishāh's power, but, on the contrary, wielded power of their own which they could use, in the hour of the Sublime Porte's weakness, for forcing upon the Porte their own interpretation of the 'capitulations' to the advantage of their subjects in *partibus Ottomanorum*.

to have been exceptional. In most universal states the tendency seems to have run contrariwise, towards uniformity. Indeed, even in Ottoman history there was an undercurrent in this direction; for from the fourteenth to the seventeenth century of the Christian Era the dominant Muslim community in the Ottoman Empire was continually gaining adherents at the subject non-Muslim communities' expense, and, if this process had not been checked by a decline in the 'Osmanlis' prestige in the eyes of their Orthodox and Monophysite Christian subjects when the tide turned against 'the Ghāzis of Rum'¹ in their warfare with the Christians of the West,² it is conceivable that eventually the Empire might have arrived at uniformity in civil law through attaining uniformity in religion.

In the more frequent cases in which the tendency towards uniformity had prevailed over opposing forces, this common result had not always been reached by the same means or at the same pace.

In the Sinic World, Ts'in She Hwang-ti characteristically imposed an oecumenical uniformity of law at one stroke by decreeing that the legislation in force in his own ancestral kingdom of Ts'in should be applied throughout the territories of the six rival states which he had suddenly conquered and annexed.³ This act was doubly revolutionary, for these abruptly imposed Laws of Ts'in did not represent the traditional customs even of that outlandish march-state. They were one of those sweeping innovations executed in Ts'in, rather more than a hundred years earlier, by the philosopher-statesman Shang Yang (*deces-sit* 338 B.C.) which had prepared the way for Ts'in's decisive victory over her competitors in Ts'in She Hwang-ti's generation. Shang Yang had been one of the pioneer exponents of the so-called 'Legist' School of philosophy,⁴ which had challenged the sanctity of customary rights and duties and had preached to the receptive ears of sovereigns the Machiavellian doctrine that all means were legitimate for attaining the socially expedient end of breaking the power of a feudal aristocracy for the benefit of parvenu monarchies.

Ts'in She Hwang-ti's revolutionary act had at least two Modern Western parallels. Napoleon introduced his newly minted codification of French law not only in France within her pre-Napoleonic limits, but in Italian, Flemish, German, and Polish annexed territories and client states of the Napoleonic Empire. The British Government of India introduced 'the Common Law' of England—partly in its original form and partly in adaptations embodied in local legislation—throughout the Indian territories over which it established its own direct rule.

This act of British statecraft, as far as it went, was more audaciously revolutionary than either of the other two, for the new law which Napoleon and Ts'in She Hwang-ti imposed on their subjects had, after

⁴ For Shang Yang's doctrine and achievements, see pp. 169 and 170, above.

all, come out of the bosom of the society of which the autocrat and his subjects alike were members, whereas the English 'Common Law' was the outcome of Western religious, political, and economic traditions and influences that were alien to the Muslim as well as to the Hindu subjects of the British Rāj. But, though, in this instance, the wind was not tempered to the shorn Indian lamb, his British shearers tactfully made the operation tolerable for him by shaving him only partwise, like a Parisian poodle.

The civil province of law can be divided into two departments, one concerned with what, in laymen's language, may be described as the 'business relations' between private individuals, and the other with what, in the language of the art, is known as 'personal statute'. 'Business relations' are a broad field in which the pocket is touched without deeply affecting the heart; 'personal statute' is a relatively narrow field, but it touches the quick, for its agenda are the intimacies of social life—marriage, wills, inheritance, wardship, and the like. The 'Osmanlis, as we have seen, consigned both these departments of the civil province of law to be dealt with in the separate communal courts of the Muslim community and of the non-Muslim *millets* of the Ottoman Empire in accordance with their respective communal laws. In the derelict domain of a defunct Mughal Empire in India, the British found a *macédoine* of religions, cultures, and peoples closely resembling the contemporary hotch-potch in the Ottoman dominions, but they worked out a different solution for a similar problem. They gave jurisdiction over the whole field to their own newly instituted British Indian courts, but, in prescribing the law that was to be applied in these courts, they confined the application of the English 'Common Law' and its British Indian derivatives to the department of 'business relations', and laid down that cases concerning 'personal statute' should continue to be governed by the communal law of the parties.¹

Like the British in India, the Incas in their Andean Empire partitioned the field of law—apparently on somewhat similar lines.

'The customary rules, varying from one clan to another, [under which their subjects had lived,] were subordinated by the Incas to their own law, which was rigorous and uniform. The customary rules survived in great numbers, as was natural, in the domain of private law. The Incaic Law, which was by far the more important of the two, constituted a civil and criminal law of very wide scope.'²

The Romans were slower than the Incas or the British or Napoleon or Ts'ing She Hwang-ti in achieving uniformity of law in their empire.

¹ This was done, not by drawing up any general definition of the field covered by 'personal statute', but by enumerating in each case the subjects in respect of which the existing communal law of the parties was to be applied in the British Indian courts. The area of the field was different in different cases. The legal institution enabling an owner of property, by making a will which, if valid, is recognized and made enforceable by the law, to determine during his lifetime how his property shall be disposed of after his death, was a feature of Islamic Law, as it was of Western Law, but was unknown to Hindu Law. As a consequence of this historical fact, the testamentary province of personal law came, for Hindus, to fall within the field of the English 'Common Law' or its British Indian derivatives, while for British Indian Muslims it continued to be administered in accordance with the *Shari'ah*.

² Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut d'Ethnologie), p. 182.

To live under Roman Law was one of the reputed privileges of Roman citizenship, and the progressive conferment of the citizenship on the Empire's subjects was not carried to its completion till the reign of Caracalla (*imperabat* A.D. 211-17).¹ As and when they received the citizenship, however, the inhabitants of the Roman Empire automatically came under the rule of Roman Law in all its provinces and departments, and thus the universal reign of Roman Law, when it did come, was all-embracing. In the parallel history of the Arab Caliphate the reign of the Islamic Law was progressively extended by conversions of non-Muslim subjects of the Caliphate to the empire-builders' religion, and, though the non-Muslim residue in the Caliphate was never reduced to the same infinitesimal fraction of the population as the non-citizen residue in the Roman Empire in its latter days, the mass-conversion to Islam that took place in the Caliphate and its successor-states from the ninth to the thirteenth century of the Christian Era gained in momentum as the effective power of the Caliphate progressively decayed, and this produced a far more homogeneous result than the corresponding process in the Ottoman Empire, which, as we have seen, was checked, instead of being stimulated, by the political decline of the universal state.²

The Attempt to stabilize the Law in Japan under the Tokugawa Régime

In the Roman Empire and other universal states in the days of their decline, attempts were made to arrest the course of deterioration by 'freezing' an existing legal or social situation. The Tokugawa Shogunate in Japan was perhaps unique among universal states in applying this prescription of 'freezing' from first to last and in achieving the *tour de force* of arresting change in the outward forms of social life (though not, of course, in the inward realities) over a span of more than 250 years.

In the domain of law the Tokugawa régime, so far from regarding equality before a uniform law as being a desirable ideal, exerted itself to accentuate and perpetuate a caste division between the feudal aristocracy and their retainers on the one side and the rest of the population on the other which was one of the worst of the wounds that the Japanese Society had inflicted on itself during a foregoing Time of Troubles. The cue was given by Tokugawa Ieyasu's predecessor and patron Hideyoshi in an edict of A.D. 1587 (popularly known as 'the Taikō's Sword Hunt') ordering all non-samurai to surrender any weapons in their

¹ See V. v. 446-7, and pp. 155-6, above, and p. 375, below.

² This at first sight puzzling difference is to be explained by a difference in the character of the external enemies by whom a declining Ottoman Empire and a declining 'Abbasid Caliphate were respectively menaced. The most formidable assailants of the 'Abbasid Caliphate were pagan Turkish and Mongol Eurasian Nomads who were as terrifying to the Caliphate's Zoroastrian and Christian subjects as to the ruling Muslim community. In these circumstances the subjects found salvation in adopting Islam themselves and helping their former masters to convert to their now common religion the barbarian conquerors of both parties alike (as the ex-Roman citizen body in Gaul dealt with their pagan Frankish conquerors by converting them to their own recently adopted Catholic Christianity). By contrast, the most formidable assailants of the Ottoman Empire were Western Christians whose culture became extremely attractive to the Ottoman Christians in the secularized version of it that was placed on the international market towards the close of the seventeenth century of the Christian Era, at the very time when the tide of war was turning against the 'Osmanlis.

possession.¹ The recently and arduously established central government further sweetened the pill for the feudal lords whom it had deprived of their long-abused *de facto* local independence by leaving them a very free hand to maintain and develop as they pleased, in all matters that the central government did not consider pertinent to the preservation of its own authority, the variegated 'house laws' which the ruling family of each fief had gradually hammered out and enforced, within the limits of its own parochial jurisdiction, during the later stages of the foregoing Time of Troubles, particularly during the fifteenth and sixteenth centuries of the Christian Era.² The edict entitled 'the Laws of the Military Houses' which Tokugawa Ieyasu promulgated in A.D. 1615, on the morrow of his crushing retort to the last challenge to his absolute authority,

'is a document which, like the formularies and "house laws" of earlier times, is not so much a systematic collection of specific injunctions and prohibitions as a group of maxims, in somewhat vague language, supported by learned extracts from the Chinese and Japanese classics.'³

'This "Constitution" . . . was regarded by the Shogunate as fundamentally unchangeable. It was re-affirmed by each shogun on his succession, in a solemn ceremony attended by all his vassals; and, though circumstances sometimes forced them to alter it in detail, they never admitted or even contemplated any deviation from its essential principles, and they punished without mercy any breach of its commands.'⁴

It is noteworthy that under this ultra-conservative régime a tendency towards the standardization of local laws did nevertheless declare itself.

'Within their own fiefs the barons enjoyed a very full measure of autonomy. . . . But the Shogunate, without interfering, used to keep a sharp watch on the conduct of the feudatories, and it was one of the chief duties of the censors (*metsuke*) and their travelling inspectors to report upon affairs in the fiefs. For this and similar reasons there was a general tendency among the *daimyō* to assimilate their administrative and judicial methods to those of the central authority, and the legislation in which the Shoguns freely indulged soon began to displace the "house laws" of the fiefs where it did not clash with local sentiment and habit.'⁵

The Expedient of Codification

In universal states in which a progressive standardization of the law had resulted in the attainment of approximate uniformity, there had sometimes been a further stage in which a unified imperial law had been codified by the imperial authorities.

In the history of the Roman Law, the first step towards codification was the 'freezing', in A.D. 131, of the *Edictum Perpetuum* that had hitherto been promulgated afresh by each successive Praetor Urbanus at the beginning of his year of office,⁶ and the final steps were the promulgation

⁶ Since *circa* 367-366 B.C.—the traditional date at which the practice of annually electing a governing college of three magistrates had been reinstituted (or perhaps in reality introduced for the first time)—or at any rate since 243 B.C., when the number

of the Justinianean *Code* in A.D. 529¹ and *Institutes* and *Digest* in A.D. 533² and the subsequent abrogation of the legal validity of all previous legislation and learned comment except in so far as it was reproduced in one or other of the three components of the new *Corpus Iuris Romani*. In the Spanish Empire in the Americas, after two abortive attempts at codification, a Creole Tribonian was found at last, in the person of Antonio León Pinelo, to codify the existing laws of the Indies in a *corpus iuris*, entitled *Recopilación de Leyes de los Reynos de las Indias*, which was completed in A.D. 1635 and eventually published, in a revised version, in 1681.³ Thereafter the stream of legislation continued to flow till the *Recopilación* had fallen out of date. But a project, first for revising and then for replacing it, which was launched in A.D. 1765, was never carried through.⁴ In the Sumeric 'Realm of the Four Quarters' an earlier code compiled under the Sumerian emperors who had ruled this Sumeric universal state from a seat of government at Ur during the first chapter

of annually elected Roman magistrates of the rank of 'praetor' (the next highest rank to the supreme magistracy represented by the two consuls) had been increased from one to two, one praetor had always been detailed to take charge of the conduct of legal business in the metropolis, and hence had come to be known as the Praetor Urbanus. The transformation of a once socially simple peasant community first into one of the Great Powers, and finally into the imperial mistress, of a complicated and sophisticated Hellenic Society had gradually made it necessary for the Praetor Urbanus to interpret—and, by interpreting, to extend—the existing Roman Law in order to make it applicable to an ever-increasing range and complexity of cases. In order to cope with this problem, it had become customary for each successive Praetor Urbanus, on his accession to office, to draw up, in consultation with the best living legal authorities whose advice he could obtain, a declaration of the lines on which he proposed to administer the law during his own term of office. This practice had been regularized by a *Lex Cornelia* of 67 B.C., which had made it thenceforward obligatory, and no longer merely customary, for the Praetor Urbanus to adhere to the terms of his own edict when once he had posted it up, in order that jurymen, judges, litigants, and the general public might know in advance the terms on which the law was going to be administered during the current year (Strachan-Davidson, J. L.: *Problems of the Roman Criminal Law* (Oxford 1912, Clarendon Press, 2 vols.), vol. i, pp. 72–73). From 67 B.C. to A.D. 131 it had still been theoretically open to each successive Praetor Urbanus to ignore the edicts of his predecessors and to draft an entirely new annual edict which, though it would be binding on the draftsman, would no more bind his successors than he himself had been bound to follow the drafts of his predecessors. But, though the word *perpetuum*, as used in the *Lex Cornelia*, had thus meant no more than 'valid for twelve months', the effect had been to confirm the practice—no doubt by then already well established—of carrying over the major part of the edict from year to year, since a Praetor Urbanus who had actually exercised his theoretical right to recast it *in toto* would merely have thrown the administration of the law into confusion if he had accomplished the *tour de force* of executing this herculean labour. Thus from 67 B.C. to A.D. 131 the *Edictum Perpetuum* had been a supple instrument in which the benefits of a substantial continuity had been combined with opportunity for the law to grow in response to changes in the social life with which the law was concerned. The Emperor Hadrian commissioned the legal expert Salvius Iulianus to edit, rearrange, and systematize the *Edictum Perpetuum* of the day, and Iulianus's edition was given the force of law, and at the same time made definitive, by a *senatus consultum* of A.D. 131. The effect, of course, was, not to bring the development of Roman Law to an end, but to transfer to the Senate and the Princes the virtual legislative power which, under the terms of the *Lex Cornelia* of 67 B.C., the Praetor Urbanus had previously been sharing with them *de facto*.

¹ According to Collinet, P.: 'The General Problems raised by the Codification of Justinian', in *Tijdschrift voor Rechtsgeschiedenis* (Haarlem 1923, Tjeenk Willink), p. 6, there were two editions of the *Code*, of which the first was ordered on the 13th February, 528, and was promulgated on the 7th April, 529, while the second was promulgated on the 17th November, 534.

² According to Collinet, *ibid.*, the *Digest* was ordered on the 15th December, 530, and was promulgated on the 16th December, 533; the *Institutes* were promulgated on the 21st November, 533.

⁴ See *ibid.*, p. 114.

of its history (*imperabant circa* 2143-2026 or 2079-1962 B.C.) appears¹ to have been the basis of the later code, promulgated by the Amorite restorer of the Empire, Hammurabi of Babylon,² which was brought to light in A.D. 1901 by the Modern Western archaeologist J. de Morgan in the course of his excavations at Susa, whither the stele on which Hammurabi's code had been engraved had been carried away from Babylon in the twelfth century B.C. by the Elamite raider Shutruk-Nachchunte.³ In the main body of the Far Eastern World the victory of the law of the Mongols' sedentary subjects over their Nomad conquerors' *Yāsāq*⁴ was celebrated in the codification of Chinese law in and after the reign of Hung Wu (*regnabat* A.D. 1367-98),⁵ the Chinese patriot leader who had founded the indigenous Ming Dynasty by expelling the Mongols from China-within-the-Wall.⁶ In the Napoleonic Empire a labour which elsewhere was usually 'staggered' over a span of many generations was crowded, for once, into the compass of a single lifetime.

The Historical Background of Codification in the Spanish Empire of the Indies

In all these otherwise diverse instances the work of codification was an urgently needed social service. Hung Wu and Hammurabi were confronted with the problem of conjuring order out of the confusion to which the law, like the rest of the apparatus of oecumenical government, had been reduced by the respective intrusions of alien Mongol and alien Elamite conquerors. In the Andean World, where the Incaic Law had been as strictly administered as it had been sternly conceived,

'Things changed completely when the Spaniards arrived. The swift and inexorable justice of the Inca disappeared, there was a multiplication of

¹ See *The Cambridge Ancient History*, vol. 1, 1st ed. (Cambridge 1924, University Press), pp. 435 and 461; Rostovtzeff, M.: *Caravan Cities* (Oxford 1932, Clarendon Press), p. 9; Hrozný, B.: *Die Älteste Geschichte Vorderasiens und Indiens* (Prague 1943, Melantrich), p. 113. Hrozný ascribes the first essay in codification to the revolutionary reformer Uru-kagina of Lagash, who lived in the third quarter of the twenty-sixth century B.C., or in the first quarter of the twenty-fifth century (see the Note on Chronology in vol. x.).

² English translations of Hammurabi's Code are given in Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), pp. 181-222, and in Pritchard, J. B.: *Ancient Near Eastern Texts* (Princeton 1950, University Press), pp. 163-80. A convenient summary of the contents will be found in *The Cambridge Ancient History*, vol. cit., ed. cit., pp. 516-21. Pritchard, in op. cit., pp. 159-63, gives translations of fragments of codes promulgated at Isin and at Eshnunna during the interval between the fall of Ibbi-Sin of Ur and the rise of Hammurabi.

³ See Hrozný, op. cit., p. 113.

⁴ See pp. 256-7, above.

⁵ 'The first Emperor of the Ming Dynasty, immediately following the capture of Wuchang, ordered a revision of the existing law. In the tenth month of the first year of his reign as King Wu, Li San-Chang was appointed Head of the Law Codification Commission, assisted by Yang Shien, Liu Chi and Dao An. The Code was completed in the twelfth month. In the sixth year of the reign of Hung Wu, Liu Wei-chien was designated to compile the Code of Great Ming, which was submitted by Sung Lien to the Emperor for approval the following year. The Code underwent modifications from time to time after that, and was finally completed and revised by Wu Wei-yung and Wang Kwong Yang. It was promulgated in the thirtieth year of the same reign.' (Note communicated to the writer on the 12th December, 1947, by the kindness of the Chinese Ambassador at the Court of St. James's, Mr. F. I. Cheng, from the record in the official History of the Ming Dynasty.)

⁶ The retransfer of the capital of China from Nanking to Peking by Hung Wu's son and second successor Yung Lo has been discussed in II. ii. 122-3 and on p. 237, above.

interminable suits, the judges were full of tenderness towards criminals and debauchees, and in the markets of the great cities there were Indians to be found who gained their livelihood by serving as witnesses.¹

Moreover,

'Under an absolute and paternalistic [Spanish] monarchy, legislation for the Indies soon became very voluminous, touching every aspect of the duties, rights and responsibilities of the colonists and of the officials set to rule over them. This legislation was intended to carry over into America the spirit and intent of the law of the metropolis, as Philip II explicitly declared in A.D. 1571. It implied the transplanting of society and institutions from an Old World to the New. Yet the legislation of Castile itself had in the colonies the force only of supplementary law. From the very first the Crown had to "adapt the distinct physiognomy acquired by traditional institutions" to circumstances, both geographical and historical, which were radically different from those in the metropolis. The peculiar conditions prevailing in America called for the elaboration of a new legislation with a distinct character of its own. Moreover, in spite of the centralist and unifying tendencies of Hapsburgs and Bourbons, the Crown was forced to take into account, both in legislation and in its application by viceroys and governors, the great differences between one region in America and another. A surprising amount of autonomy was often permitted to colonial authorities. There likewise grew up a substantial amount of customary law in the overseas dominions derived from the jurisprudential practices of the times, which had a recognized legal force if accepted by the Crown and if no written legislation was applicable. Much of this customary jurisprudence developed from the modifications of royal orders by viceroys and captains-general to meet the exigencies of a local situation. Finally, the Crown tried to incorporate into its American legislation some of the juridical customs of the aborigines—especially of those, such as the Incas and the Aztecs, who had evolved a strong political and economic organization—customs which were not in contradiction to the fundamental precepts of Spanish organization and control.'²

In the *Recopilación de Leyes de los Reynos de las Indias*, 'León Pinelo reduced the laws of the Indies to over 11,000, extracted from some 400,000 royal *cédulas*.'³ It is little wonder that this clearance of an Augean stable took even that 'zealous and indefatigable' labourer ten years. But it reflects some discredit on the Spanish imperial administration that the task should not have been placed in Pinelo's competent hands until after A.D. 1624, considering that an abortive preceding essay in codification had been commissioned as far back as A.D. 1582. It is perhaps still more discreditable to the authorities that, though Pinelo's draft was completed in A.D. 1635 and was approved by them within the next seven months, the eventual revised version was not published until A.D. 1681.⁴

The Historical Background of Codification in the Roman Empire

This complexity of the historical background of Pinelo's *Recopilación* is surpassed by that of Tribonian's *Corpus Iuris*. The Law of the Twelve Tables, which, according to the traditional chronology, had been pro-

⁴ See *ibid.*

mulgated in 451-450 B.C. by the Board of Decemvirs appointed to draft it, had equipped the still archaic Roman community of the age with an instrument that, by that time, would already have been out of date in the heart of an Hellenic World on whose outskirts Rome then lay. The subsequent progressive and cumulatively enormous revolution in Rome's social and political position demanded, and duly evoked, a flood of new legislation which flowed for ten centuries in a number of different channels: laws enacted by the *Populus Romanus*; votes, possessing the force of law, passed by the Plebs; the *Edictum Perpetuum* of the Praetor Urbanus; the resolutions of the Senate; and the acts, decisions, and decrees of Caesar after the Republic had been succeeded by the Principate. When the stream of often capricious and inconsequent acts of Plebs and *Populus* had ceased to flow, the new stream of imperial legislation became, as time went on, even more inconsequent, capricious, and voluminous till, in the western half of the Empire during the century ending in A.D. 476, a climax was reached in a spate of decrees reiterating the same commands on a rising note of hysteria, with threats of ever more savage penalties for disobedience which merely advertised the truth that the imperial legislators in that part of the Empire had by that stage become impotent to enforce their authority. 'Et septemgemini turbant trepida ostia Nili.'¹ The ancient river of Roman legislation had dispersed its waters into a mazy delta on its way to losing them in an 'unharvested sea'.

Yet this maze of legislation was not so formidable as the jungle of learned comment that had sprung up on its marge. Law is by nature conservative, and its ineradicable resistance to change calls always and everywhere for the services of skilled interpreters to ensure that it shall continue to serve the practical needs of social life in spite of perpetually losing its unequally matched race with changing circumstances. In the administration of the Roman Law during the thousand years following the promulgation of the Twelve Tables, the lag—to be made up by interpretation—between the formal state of the law and the social task required of it was enlarged to an unusual degree of magnitude in consequence of the extraordinary political career through which a rustic city-state had grown into an oecumenical empire. If the Roman juriconsults were to succeed in bridging this formidable gulf,² they stood in need of all the intellectual building-materials on which they could lay hands; and, after the reception of Hellenic philosophy at Rome in the second century B.C., the ethics of the Stoic School gradually came to supply the interpreters of the Roman Law with those comprehensive maxims, logical principles, and imaginative vistas that were required for transforming the peculiar local customs of a primitive-minded peasantry into a system acceptable to the Hellenic World.

Under the early Principate as well as under the late Republic, a still persisting aristocratic tradition kept the study and interpretation of the

¹ Virgil: *Aeneid*, Book VI, l. 800.

² The archaic title *pontifices* would have described the functions of these secular Roman juriconsults more aptly than those of the Christian bishop who eventually took it over from the college of pagan priests who were its original bearers.

law in the hands of a governing class—confined to the senatorial and equestrian orders—whose members were expected to be men of action as well as men of culture and would not have been allowed by their superiors or their peers to rise to high positions of political responsibility exclusively in virtue of eminent legal ability, without having also shown at least some aptitude for military command and public administration. This aristocratic way of public life, with its obvious merits and its equally obvious limitations, was abandoned, in the field of law, in the reign of the Emperor Hadrian (*imperabat* A.D. 117–38),¹ whose personal policy was consciously inspired by a zeal for efficiency but at the same time served the purposes of a *Zeitgeist* that was already up in arms against social privileges and political monopolies.² Hadrian converted his predecessors' informal and indefinite entourage of advisers into an imperial council of salaried juriconsults of senatorial and equestrian rank, and he also created a panel of eminent legal authorities (*iuris prudentes*) whom he invested with powers of replying officially to legal queries (*ius respondendi*) and, in effect, of acting corporately as a legislative body, since he provided that their opinion, when unanimous, should have the force of law. By these measures, Hadrian called into existence a professional class of legal specialists; and the consequent lawyers' 'Golden Age' outlasted the Antonine 'Indian Summer' and survived—though not unscathed—the intermittent frosts of the ensuing Severan overture to winter.³

The virtues and abilities of Papinian—whom Posterity regarded as the brightest link in all the golden chain of the Roman legal tradition⁴—found a lawyer's mind to appreciate them and a soldier's arm to protect them combined in the person of Septimius Severus, who had been Papinian's predecessor in the office of *Advocatus Fisci* before becoming his imperial master and patron. Yet even the grim founder of the Severan Dynasty could not save Papinian from paying the extreme penalty for his probity to the savagery of Septimius's brutal son and successor Caracalla; and Papinian's disciple Ulpian was assassinated in his turn, by the praetorian guards, in the presence of his impotent imperial friend and admirer the gentle Alexander Severus. Paul, and Paul only, was left; and when, seven years after the murder of Ulpian, the last Emperor of the House of Severus himself succumbed to the tragic fate from which he had failed to rescue an esteemed and beloved public servant, this culminating political crime heralded a blizzard of anarchy in which liberal legal studies were blasted and seared. Yet, even so, the golden century of Roman legal studies, from the 'freezing' of the Urban Praetor's Perpetual Edict in A.D. 131 to the 'revolt of Caliban' in A.D. 235, had produced a volume of output so enormous that for Tribonian and his colleagues, three hundred years later, the compression of this matter

¹ See p. 262, with n. 6, above.

³ See *The Cambridge Ancient History*, vol. xi (Cambridge 1936, University Press), pp. 314–15 and 816–26.

⁴ A rescript of Galla Placidia's, dated the 7th November, A.D. 426, gave Papinian the casting vote in any conflict of authority between two or more of the five classical jurists (Papinianus, Paullus, Gaius, Ulpianus, Modestinus) in which the *theod.* i. iv. 3). including Papinian, were ranged in equal numbers on either side (*Cod. Theod.* i. iv. 3).

into the *Digest* was the heaviest of their three titanic tasks, though they virtually confined their selection of materials to the contents of treatises produced within this relatively short period in the long history of Roman Law.

'Seventeen lawyers, with Tribonian at their head, were appointed by the Emperor [Justinian] to exercise an absolute jurisdiction over the works of their predecessors. If they had obeyed his commands in ten years, Justinian would have been satisfied with their diligence; and the rapid composition of the *Digest* or *Pandects* in three years (15th December, A.D. 530—16th December, A.D. 533) will deserve praise or censure according to the merit of the execution. From the library of Tribonian they chose forty, the most eminent civilians of former times; two thousand treatises were comprised in an abridgement of fifty books; and it has been carefully recorded that three millions of lines or sentences were reduced, in this abstract, to the moderate number of one hundred and fifty thousand.'¹

By comparison with this second of his labours, Tribonian's first feat of compiling the *Code* was easy. In codifying within a term of fourteen months (13th February, A.D. 528—7th April, A.D. 529) the decrees that had been promulgated by successive emperors in the course of the four centuries that had elapsed between the accession of Hadrian² and the current year of Justinian's reign, Tribonian could avail himself of the existing works of three forerunners: the unofficial codes compiled by Gregorius (later than the 19th October, A.D. 294, and probably in A.D. 297) and by Hermogenianus (later than the 21st March, A.D. 295)³ and the official supplement to them promulgated, on the 15th February, A.D. 438, by the Emperor Theodosius II (*imperabat* A.D. 408–50),⁴ which covered the years A.D. 312/13–437 for the Eastern Half of the Empire and the years A.D. 312/13–432 for the Western Half.⁵ By comparison, again, with the arduousness of compiling the *Code*, it was child's-play for Tribonian to round off his threefold enterprise by enucleating the elements of Roman Law in the *Institutes*.

The Historical Background of Codification in the Napoleonic Empire

The *Corpus Iuris Iustinianum* had a worthy counterpart in the Napoleonic array of codes in respect of both the speed and the immensity of the labours of which it was a monument.

'The difficulties of this undertaking consisted mainly in the enormous

¹ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. xlv.

² The series did not begin before Hadrian's reign because Hadrian was the initiator of the practice of promulgating imperial decrees undisguisedly as such. 'From Augustus to Trajan, the modest Caesars were content to promulgate their edicts in the various characters of a Roman magistrate; and, in the decrees of the Senate, the epistles and orations of the Prince were respectfully inserted. Hadrian appears to have been the first who assumed, without disguise, the plenitude of legislative power' (Gibbon, *op. cit.*, loc. cit.). This new departure of Hadrian's was at variance with the spirit of the Principate as inspired by Augustus.

³ A second edition of Hermogenianus's code was published (probably by Hermogenianus himself) in the reign of Constantine the Great (*imperabat* A.D. 306–37), and a third during the joint reign of Valentinian and Valens (A.D. 364–75).

⁴ The Theodosian Code had taken just under nine years to compile, since the commissioners had been appointed on the 26th March, 429.

⁵ See Seeck, O.: *Geschichte des Untergangs der Antiken Welt* (Stuttgart: Metzler), vol. vi (1920), pp. 164–83, and vol. vi, Anhang (1921), pp. 428–32.

mass of decrees emanating from the national assemblies, relative to political, civil and criminal affairs.¹ This amorphous product of more than eleven years of French revolutionary legislation² was comparable with the spate of decrees of the Roman Emperors, from Hadrian to Justinian, which Papinian had to confine within the dykes of the Justinianean *Codex*. The resemblance extended beyond the sheer volume to the intrinsic nature of the materials. 'Many of these decrees, the offspring of a momentary enthusiasm, had found a place in the codes of laws which were then compiled; and yet sagacious observers knew that several of them warred against the instincts of the Gallic race.'³ The French legislators had been attempting, like the Roman jurists, to transfigure a litter of ancient local customary laws by suffusing it with a modern philosophy; but they had sought to achieve at a stroke what their Roman ensamples had been content to accomplish in the course of three or four hundred years, and they had gone to work with an inferior intellectual instrument; for the self-confident iconoclastic humanism of Rousseau or Voltaire was a jejune spiritual elixir by comparison with the ripe and rueful wisdom of a Stoicism that had been refined by many generations of suffering.

The Napoleonic codifiers were therefore well advised in rejecting their revolutionary heralds' academic ideal of making a clean break with the past; yet they could not contemplate reinstating the antediluvian law as it had stood.

'Old French law had been an inextricable labyrinth of laws and customs, provincial privileges, ecclesiastical rights, and the later undergrowth of royal decrees; and no part of the legislation of the revolutionists met with so little resistance as their root-and-branch destruction of this exasperating jungle. Their difficulties only began when they endeavoured to apply the principles of the Rights of Man to political, civil and criminal affairs.'⁴

The revolutionary legislators' axes had cleared away the primeval forest to force a rank second growth in the name of simplicity and reason, and it was left for the Napoleonic codifiers to produce a blend of old and new which could serve the practical needs of the Western Society of the day.

In putting this hard but urgent task in hand, Napoleon did not have to start entirely *de novo* or unaided. Before the expiration of the *Ancien Régime* the industry and sagacity of pre-revolutionary French jurists had already gone far towards distilling a common essence out of the divers provincial varieties of French customary law; and, in following up their work, Napoleon had at his elbow, in the Second Consul Cambacérès, a learned and clear-headed lawyer who had stumbled upon the pitfalls of the revolutionary attitude and method in failing, in A.D. 1793, to obtain the approval of the Convention for a draft of a civil code which he and his fellow committeemen had taken six weeks to prepare instead of the month which the Convention had assigned for the completion of the

² Reckoning from the opening session of the States-General on the 5th May, 1789, to the appointment, on the 12th August, 1800, of a commission to draft a civil code.

³ Rose, op. cit., vol. cit., p. 288.

⁴ Ibid., p. 288.

work. The four commissioners appointed on the 12th August, 1800, by Napoleon, to try again where the Convention's committee had failed, succeeded in carrying out their instructions to produce a first draft in four months. It was printed on the 1st January, 1801; and, though it then still had to run the gauntlet of the Court of Cassation, the Courts of Appeal, the Legislative Section, and the General Assembly of the Council of State, and thereafter the Tribunal, a civil code of 2,281 articles, embodying the amendments of these successive critics, was duly promulgated between the 15th March, 1803, and the 30th March, 1804, and was thus completed only three and a half years after the drafting commission had been nominated. Within nine and a half years of the same initial date, the entire gigantic task of producing not only a civil code but also a code of civil procedure, a criminal code, a code of criminal procedure, and a commercial code had been completed by the promulgation of the fourth and last book of the criminal code on the 2nd March, 1810.

The extent of Napoleon's own personal contribution to the shaping of these five Napoleonic codes may continue to be disputed. We may believe contemporary reports that, in some episodes of the thirty-five sittings, out of eighty-seven in all, at which the First Consul was present and in the chair while the draft of the Civil Code was being debated in the General Assembly of the Council of State, Napoleon 'fatigued the attention of his audience by the confused abundance and the unexpected turns of his thought'.¹ We may follow a recent English master of Napoleonic studies in his verdict that 'the Civil Code was a hasty piece of work, and' that 'the First Consul imported a strong gust of passion and of politics into the laboratory of legal science'.² But any student of history who, at however low a level, has had dealings with both scholars and men of action, and has also had it laid upon him to induce them to co-operate with one another on a common task, will not be blind to the significance of Napoleon's decisive intervention, on the 1st April, 1802, to shorten, simplify, and improve the procedure for passing the draft of the Civil Code at a moment when the cumbrous wheels of an academic constitution had almost stopped turning. And he will readily be convinced that, 'without [Napoleon's] driving power, [the Civil Code] would certainly not have come into existence so soon, and might not have come into existence at all'.³

The Price of Codification

Who had been the principal beneficiaries of the empire-builders' legal heritage and of their successors' codifying labours?

The victims of codification would hardly have reckoned themselves among the beneficiaries if they could have risen from the dead to inspect their successors' handiwork. Among the codifiers whom we have just passed in review, the Napoleonic team alone could have contemplated with equanimity a personal encounter with predecessors who, in this

¹ Fisher, H. A. L., in *The Cambridge Modern History*, vol. ix (Cambridge 1906, University Press), p. 152.

² *Ibid.*, p. 162.

³ *Ibid.*, p. 163.

exceptional case, would have been compelled, on confrontation, to confess that these deft and elegant surgeons had improved, out of all recognition, the uncouth build of a *corpus vile*. By contrast, the ghosts of Papinian and Ulpian might have protested in all sincerity that they would liefer have felt again, in their own flesh, the agonizing edge of their assassins' swords than have voluntarily submitted the exquisite products of their masterly intellectual labours to be butchered by the rough-and-ready workmanship of Tribonian and his colleagues.

'Instead of a statue cast in a simple mould by the hand of an artist, the works of Justinian represent a tessellated pavement of antique and costly, but too often incoherent, fragments.'¹

And it is possible that a twentieth-century historian might have felt moved to apply Gibbon's dictum to the Code of Hammurabi if the extant fragments of the underlying work of Hammurabi's Sumerian predecessors² that had been preserved independently had been sufficient to enable the latter-day student to extract and reconstruct the copious borrowings from the same source that were to be looked for in Hammurabi's redaction.

The Exceptional Service rendered by the 'Code Napoléon' to a Late Modern Western Society

In their high-handed treatment of their predecessors' work, are the codifiers performing a valuable service for their contemporaries and successors? In the judgement of an eminent post-Gibbonian Western student of Roman Law,

'Justinian's intention was to promulgate legislation applicable to the peoples of diverse race who were living under the law of the Empire of the East, using as his materials the texts of the Roman Law as he found it—first and foremost, the texts of the classical jurists. The basis thus given to his work was the best that he could have taken; for, in the decadent state of the science of Law in his day, he could never have succeeded in obtaining a codification comparable in merit to the system with which his name is actually associated if he had instructed his commissioners to do the drafting themselves. Just because, however, he chose the basis that he did choose, the materials that entered into the composition of his codification, and particularly into the Digest, had to be transformed—as stones from an old building that are being used in a new one are re-cut and re-mortared—in order to be brought into harmony with the exigencies of a civilization that was younger by three centuries at the least, and with the needs of an empire—the Empire of the East—whose boundaries were no longer identical with those of the *Orbis Romanus* of the generation of Gaius or Ulpian.³ This task of adaptation required the constant employ-

¹ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. xlv.

² Twenty-five laws, in all, of the code compiled in the Sumerian language by the Emperor Ur-Engur and succeeding sovereigns of the Third Dynasty of Ur had been preserved on two clay tablets from Nippur and one from Uruk (*The Cambridge Ancient History*, vol. i, 1st ed. (Cambridge 1924, University Press), p. 461). Whatever might be the respective merits of the draftsmanship, there seemed to be no doubt that, in the penalties prescribed, the Sumerian emperors' code was superior to Hammurabi's in point of humanity.

³ According to Collinet, P., *Études Historiques sur le Droit de Justinien*, vol. i, 'Le

ment of an adequate instrument, [and this instrument was found in the device of] interpolation.¹

The claim made in this passage on behalf of the authors of the *Corpus Iustinianum* could undoubtedly be substantiated by the authors of the *Code Napoléon*; but this may be one of those exceptions that prove a contrary rule; for the *Code Napoléon* was the work of empire-builders to whom History, as we have seen, had assigned the peculiar task of providing a universal state for a moribund sub-society within a larger body social that had not yet lost its vitality; and these unusual circumstances, which condemned the Napoleonic Empire itself to an early death, ensured a brilliant career for the code that was its offspring. The *ci-devant* city-state cosmos in Italy, the Low Countries, and Germany, whose incorporation into a universal state was the Napoleonic Empire's historical *raison d'être*, did duly dissolve with the downfall of the Napoleonic political edifice that had housed it in its last phase; but in this unique case the sequel was not the catastrophe of a social interregnum but a 'happy ending' in which an abortive sub-society that had failed to make a success of its deliberate departure from the standard pattern of the Western Civilization now at last succeeded in divesting itself of a separate identity which had long since ceased to be anything but a handicap and an embarrassment to it by re-entering the main stream of Western life from which it had once self-consciously sought to part company. It had been the mission of the French empire-builders to draw their non-French subjects back into a flowing current of life which was the imperial people's own native element, and from which their legal tradition and *éthos* were derived; and for this reason the successful accomplishment of a French political task, which made the Napoleonic Empire superfluous, launched the *Code Napoléon* on a flood-tide leading on to fortune.

Caractère Oriental de l'Œuvre Législative de Justinien' (Paris 1912, Recueil Sirey), the *Corpus Iustinianum* was intended to serve the current needs of the Greek and Oriental provinces of the Roman Empire (p. 14). The work is a monument of 'the transformation of Oriental elements, that had previously been merely provincial, into imperial elements [during the interval] between [the generations of] Constantine, who is a Roman emperor reigning in a Roman city, and Justinian, who is an Oriental emperor reigning over an Empire of the East' (ibid., p. 16). Justinian's board of commissioners was composed of representatives of four parties: Constantinopolitan officials, Constantinopolitan professors, Berytan professors, and advocates practising in the court of the Praefectus Praetorio per Orientem at Constantinople (ibid., p. 23)—i.e. the law schools of Constantinople and Bayrūt alone were represented, to the exclusion of those of Rome, Alexandria, Caesarea, and Athens (ibid., p. 23). According to Collinet, the Code was wholly, and the Institutes were mainly, the work of the Constantinopolitan commissioners, while the Berytan commissioners were perhaps principally responsible for the Digest (ibid., p. 24). The *Corpus Iustinianum* is a codification of the living law of the Roman East (ibid., p. 28); and this was a fusion of Hellenic Law with a Roman Law which had been adapted to Oriental requirements by an abandonment of some of its original native Roman elements (ibid., p. 29). In Justinian's day a Roman Law that, by then, had already become static in the West was still evolving in the East on Oriental lines (ibid., pp. 34, 159, and 314); and, in order to bring the *Corpus Iustinianum* into conformity with the living Roman Law of the East, a number of traditional Roman legal institutions were jettisoned in the compilation of it (ibid., pp. 213-14). The *Corpus Iustinianum* was distinguished from contemporary Western Roman Law in two ways: it was more *savant*; and, instead of being stagnant, it embodied the results of regional progress (ibid., pp. 314 and 317).—A.J.T.

¹ Collinet, P.: *Études Historiques sur le Droit de Justinien*, vol. i: 'Le Caractère Oriental de l'Œuvre Législative de Justinien' (Paris 1912, Recueil Sirey), pp. xxv-xxvi.

On the day of its promulgation the Napoleonic Civil Code automatically became law, not only for all inhabitants of France within her pre-Revolutionary frontiers, but for Walloons and Flemings in the Southern Netherlands and Germans west of the Rhine, who on the 21st March, 1804, were already fellow citizens of the French in a Republic that, on the 18th May, was to be converted into an Empire. Thereafter, from A.D. 1804 to A.D. 1811, the Code's domain was being constantly enlarged. It gained ground partly through the enlargement of the French Empire itself, which continued to swallow up satellite states and conquered territories till it stretched north-eastwards as far as Lübeck and south-eastwards as far as Terracina,¹ and partly through the 'reception' of the Code in satellite states that survived or that were increased in stature or that were enlisted as new recruits. On the 30th March, 1806, the Code was promulgated in the Napoleonic Kingdom of Italy, which by that time had been enlarged to include almost all the former dominions of Venice;² and, before the Napoleonic edifice collapsed, the Code had become law throughout Continental Italy, including the satellite Kingdom of Naples. It seeded itself in several Swiss cantons. It was promulgated in Holland on the 18th October, 1810. And it made a triumphal progress across Napoleonic Germany, where it was received in the Kingdom of Westphalia on the 15th November, 1807; in the Free City of Danzig on the 19th November, 1807; in Arenburg on the 28th January, 1808; in the Grand Duchy of Baden on the 5th July, 1808; in the Grand Duchy of Frankfurt on the 15th September, 1809; in the Grand Duchy of Berg on the 1st January, 1810; in the newly constituted Lippe and Hanseatic Departments of the French Empire on the 29th May and the 10th December, 1810, respectively; in the Duchy of Köthen on the 28th December, 1810; and in the Duchy of Nassau on the 1st and 4th February, 1811.³

The most distant and exotic of the Code's pacific conquests was the Grand Duchy of Warsaw, where it was received in A.D. 1808 in the ex-Prussian nucleus, and in A.D. 1810 in the ex-Austrian annex.⁴ In A.D. 1928 it was still in force in a fragment of territory, wedged in between the left bank of the River Niemen and the eastern frontier of East Prussia, which had once constituted the north-eastern extremity of the Duchy of Warsaw and its successor the 'Congress Kingdom' of Poland, but which in 1928 formed part of the *Saisonstaat* of inter-war Lithuania.⁵

This widespread 'reception' of the Code was brought about by a

¹ Without reckoning in the Illyrian Provinces, insulated geographically from the main body of the French Empire by the breadth of the satellite Kingdom of Italy, which France acquired from Austria in the Peace Treaty of Schönbrunn (14th October, 1809).

² All, indeed, except the Ionian Islands. The Kingdom of Italy obtained these acquisitions through the Franco-Austrian Peace Treaty of Pressburg (26th December, 1805). In the territorial rearrangements following the conclusion of the subsequent Franco-Austrian Peace Treaty of Schönbrunn (14th October, 1809) the Kingdom of Italy lost Dalmatia but acquired the Trentino.

³ This calendar of the progressive reception of the Code in Germany is taken from Fisher, H. A. L.: *Studies in Napoleonic Statesmanship in Germany* (Oxford 1903, Clarendon Press), p. 380, n. 2.

⁴ See *ibid.*

⁵ This curiosity of legal history was imparted to the writer of this Study one day in that year when he was standing in Kovno and gazing across the Niemen towards its once Napoleonic western bank.

variety of means, ranging from a more or less genuine free choice to sheer and undissimulated coercion.

"The transplantation from one country to another of a code of laws, and of a system of judicial organisation, must in all cases be a delicate proceeding, for, though the elementary principles of justice are universally appreciated, nation differs from nation in the principles of their application. . . . The immediate introduction of the French codes into the Grand Duchy of Berg seemed to the conservative mind of Count Beugnot [the French Imperial Commissioner] to savour of indiscretion. "Germany", as he reminded his Government, "had not, like France, been levelled by the legislation of iconoclastic assemblies." It would require time and instruction before she could properly attune herself to the new melodies of the Code. Nor was there any danger in delay. . . . These representations were received and rejected. On the 12th November, 1809, an imperial decree ordered that the *Code Napoléon* was to have the force of law in the Grand Duchy of Berg from the 1st January, 1810, and at the same time the Imperial Commission was requested instantly to furnish a draft scheme for judicial organization. Beugnot had no option but to obey."¹

In the Kingdom of Westphalia, likewise, the *Code Napoléon* was made law, as from the 1st January, 1808,² by the terms of a constitution, promulgated from Paris on the 15th November, 1807, which 'may be considered either in the light of a treaty or in that of a guarantee'.³ But here the peremptoriness of the imperial dictate was mitigated by the tender-handedness of its local application. In the crucial matter of feudalism, for example, a declaration of 'the unconditional abolition of serfage passed through the crucible of successive legal refinements';⁴ and when

'some proprietors complained of these proceedings as too revolutionary, the Government replied with justice that, according to the liberal principles of the *Code Napoléon* and of the Act constituting the Kingdom of Westphalia, all rights of serfage and feudalism might have been suppressed. . . ; that the suppression had been general in Genoa, Parma, Piacenza and Tuscany; but that the Westphalian Government had preferred an equitable temperament between the rigour of the laws and the respect due to long possession. They had kept everything which they could keep without violating principle.'⁵

In any case, whatever the political circumstances of its local 'reception' might have been, the intrinsic merits of the *Code Napoléon* were such as to secure its survival when the Napoleonic Empire was overthrown through an irresistible reaction of its non-French subjects and victims against an intolerable abuse of French military and political power.

"When the project for the German Civil Code came before the Reichstag in 1900, it was stated that seventeen per cent of the fifty million inhabitants of the German Empire were still ruled by French law. In the Prussian, Hessian and Bavarian Rhine provinces, and in Alsace-Lorraine, the *Code Napoléon* was administered in its original tongue; while a German translation, only slightly differing from its French prototype, was current in

⁵ *Ibid.*

Baden. That the Code should have persisted in any portion of Germany, when all the circumstances of the War of Liberation are taken into account, is a remarkable tribute to its merits. We may admit that its preparation was hurried, that the discussions in the Council of State were often unsatisfactory, and that it is based upon an imperfect survey of practical contingencies. There is doubtless great weight in Savigny's contention that Germany was not ripe for a code, and that the legal system of a country should be the natural result of its historical development. But the choice in 1807 and in 1815 did not lie between pure German and pure French law. It lay between the *Code Napoléon* on the one hand, sketchy, no doubt, and over-simplified, but lucid, intelligible and portable,¹ and an "endless waste of contradictory, conjectural and motley ordinances. . . ." We cannot wonder that, in comparison with this hybrid miscellany, the French Code seemed to many Germans to be the utterance of Reason herself.²

Even in territories where, upon the downfall of the Napoleonic Empire, the *Code Napoléon* was abrogated, along with all other Napoleonic innovations, by the 'Zealotism' of a momentarily restored *Ancien Régime* that was too uncertain of its tenure to venture to be discriminating in its policy, the imported French law was not in every case rescinded *in toto*, while in other cases it crept back, unacknowledged yet effectively operative, in a non-French disguise, when the mounting pressure of nineteenth-century Industrialism and Democracy compelled even unrepentant reactionary régimes to overhaul the antiquated law that they had reinstated in the *Code Napoléon's* place. This happened in several of the temporarily re-erected pre-Napoleonic statelets in Italy; and, when, in belated response to Napoleon's trumpet-call,³ an Italian Risorgimento

¹ The portability of the *Code Napoléon* proclaims its success; its lucidity and intelligibility account for its portability; and this trinity of virtues was heaven-sent; for the substitution of one system of law for another, *in toto* and at one stroke, is, at best, a formidable undertaking. Even when the substitute exists, ready-made, and has merely to be translated and enacted in order to give it the force of law on paper, it cannot become practically operative without the introduction of a corresponding new code of procedure and without the training up of a new generation of judges, barristers, and solicitors who have familiarized themselves with the new law and new procedure by daily practice in the courts. When the writer of this Study visited Lithuania at Eastertide, 1928, he found that, in their enthusiasm for reorganizing their life on a Lithuanian national basis, the Lithuanians had taken two steps which, in their combined effect, were producing serious practical difficulties. On the one hand they had set themselves to draft a unitary national Lithuanian system of law to replace both the *Code Napoléon*, which was in force in the fragment of Lithuanian territory on the left bank of the Niemen, and the Imperial Russian Law, which was in force in the rest of the country. Simultaneously, in their educational system, they had deposed the Russian language from its former position of being the first foreign language to be learnt by Lithuanian children, and had replaced it by a choice between the leading Western languages. This replacement of the Russian language in the Lithuanian schools was, of course, as quick and easy a step as the replacement of the Imperial Russian Law in the Lithuanian Courts was slow and difficult. By A.D. 1928 the Lithuanians had realized, too late, that their self-imposed task of introducing a new national Lithuanian system of law was not going to be fulfilled as a going concern within any foreseeable period of time; but by 1928 a time could already be foreseen when the Imperial Russian Law would have to be administered in Lithuania by a rising generation of Lithuanian judges and lawyers who would have been brought up without having been taught the Russian language. To tide over the awkward interim stage that could thus be seen ahead, could not the Imperial Russian Law be translated into Lithuanian? Alas, no; for this was not a code but a congeries of 'case law', and the use of it demanded a familiarity with decisions of the Imperial Russian Senate running into hundreds of volumes. In such a situation the merits of the *Code Napoléon* were conspicuous. Happy that small minority of Lithuanian judges, lawyers, and litigants whose business was transacted on the River Niemen's Napoleonic bank.—A.J.T.

² Fisher, op. cit., p. 379.

³ See V. v. 642.

had swept this political lumber away, to make room for an Italian national state that aspired to be liberal as well as united, Italian codifiers frankly took the *Code Napoléon* as their model in drafting the Italian Civil Code that was adopted on the 25th June, 1865, and was brought into force on the 1st January, 1866.

The *Code Napoléon*'s most remarkable triumphs, however, were its conquests of alien worlds on which the claws of the Napoleonic eagle had never fastened. During Napoleon's trial of strength with Great Britain, British sea power had foiled his attempt to conquer Egypt and Syria, forced him to sell Louisiana to the United States,¹ and prevented him from following up his military occupation of Spain and invasion of Portugal by pouncing upon these decrepit Powers' great possessions in the Americas. Yet the *Code Napoléon* struck roots both in the Americas and in the Levant. It became an important constituent of the local law of the State of Louisiana within the North American Union;² it influenced the development of the established variety of pre-Revolutionary French customary law in the anti-Revolutionary Canadian Province of Quebec;³ while in the successor-states of the Spanish Empire of the Indies it came as a god-send to fill the legal vacuum left by the failure of the Spanish Bourbon régime to bring up to date the worthy Pinelo's long-since antiquated *Recopilación de Leyes de Los Reynos de las Indias*.⁴

As for Egypt, it would hardly be an exaggeration to say that the *Code Napoléon* found a second home in this stronghold of Islam after the process of Westernization, foreshadowed in the shattering but transitory visitation of Napoleon's expeditionary force, had been put in hand in good earnest by Mehmed 'Alī. In the whole field of civil law outside the communal preserve of Personal Statute, the *Code Napoléon* was 'received' in Egypt in A.D. 1876 as the law for the new Mixed Courts and in A.D. 1883 (a sensational triumph, this!)⁵ as the law for the new system of civil and criminal jurisdiction,⁶ applying to Ottoman subjects in Egypt,

¹ French land power had enabled Napoleon, in a secret convention signed at Saint Ildefonso on the 7th October, 1800, to extort from the Spanish Crown the retrocession to France of the originally French possession of Louisiana, which the French Crown had ceded to Spain in the peace settlement of A.D. 1763; but Napoleon missed his opportunity for seizing this Transatlantic prey during his momentary enjoyment of the freedom of the seas after the conclusion of the Anglo-French Peace Treaty of Amiens on the 25th March, 1802; and the naval war was in full swing again by the 20th December, 1803, when the sale of Louisiana by the French Empire to the United States was completed.

² The state law of Louisiana was a blend of several different elements: the local French customary law of the *Ancien Régime*, the law of the Spanish Indies, introduced after the cession of Louisiana by France to Spain in A.D. 1763, and the English 'Common Law' introduced after the retrocession of Louisiana by Spain to France in A.D. 1800 and its purchase from France by the United States in A.D. 1803. The Napoleonic codes were grafted on to the existing local French law *pari passu* with the introduction of the 'Common Law' current in the United States.

³ This influence was manifest in the Quebec Civil Code of A.D. 1867.

⁴ See p. 263, above.

⁵ Sensational in view of the gulf between the *Code Napoléon* and the communal systems of law which it was replacing. It did, however, share one vital common source with the Islamic *Shari'ah* as well as with the communal laws of the several Christian *millets*. All these legal systems alike were derived in large measure from varieties or transmutations of Roman Law. The influence of Roman Law on Islamic Law is discussed on pp. 288-91, below.

⁶ The traditional *Shari'* courts retained their jurisdiction in matters of 'personal statute'.

that was introduced in that year. This naturalization of French Law in Egypt goes far to account for the strength of the hold which French culture obtained in Egypt notwithstanding the ultimate discomfiture of France in her military and political struggle with Great Britain for ascendancy there. The French military occupation of Egypt had lasted for little more than three years (reckoning from the landing of Napoleon's expeditionary force on the 1st July, 1798, to the ignominious surrender of 'Abdallah Menou on the 2nd September, 1801); the second and single-handed British occupation¹ had lasted for fifty-four years (reckoning from the landing of a British expeditionary force on the 20th August, 1882, to the ratification of the Anglo-Egyptian Treaty of Alliance signed on the 26th August, 1936), and in A.D. 1952 the vestiges of British occupation which the terms of the Treaty had preserved had not yet been entirely removed. Yet on the morrow of the General War of 1939-45 the by this time penetratingly Westernized governing class of Egypt bore its Western imprint in the French and not in the British variety of the pattern.

One of the most remarkable episodes in the history of the dissemination of the *Code Napoléon* was the role that it was called upon to play in Japan during the Meiji Era. In embarking on a general programme of Westernization the authors of the Meiji Revolution showed their wisdom in the field of law by hastening slowly. Their first step, taken in A.D. 1870, was to have the French Codes translated into Japanese. Law schools for French, English, and German Law were successively established in A.D. 1872, 1874, and 1887. In A.D. 1875 a commission was appointed to compile a civil code, and, after its draft, which followed the Napoleonic Civil Code very closely, had been submitted to the Japanese Government in A.D. 1878 and had been rejected, a member of the commission, the French jurist Boissonade, was asked in 1880 to prepare a new draft. His draft was published on the 27th March, 1890, and a complementary draft by Japanese jurists, covering the province of 'personal statute', on the 16th October of the same year, and the whole code was to come into force on the 1st January, 1893.

This apparent acceptance, in Japan, of a Napoleonic *Code Boissonade* was the high-water mark in the flow of the *Code Napoléon*'s influence over the face of the globe; and a turn in the tide was not slow to follow. Before the arrival of the date fixed for bringing the *Code Boissonade* into operation, the newly created Japanese Imperial Diet voted, on the 16th May, 1892, for postponing the date till the 31st December, 1896. Thereupon, a third draft was commissioned, and this draft, which was published in instalments in 1896 and 1898 and was brought into force in July 1899, was inspired, not by the *Code Napoléon*, but by the second draft of a German Civil Code, which had been published in 1895.²

The controversy in Japan which resulted in this victory of German

¹ In response to the challenge of the French occupation, British troops had already set foot on Egyptian soil from the 8th March, 1801, to March 1803; but on this first occasion they had come by invitation of the lawful sovereign of Egypt, the Ottoman Pādīshāh, and in the company of a Turkish expeditionary force.

² In the German Empire this draft was subsequently adopted on the 16th August, 1896, and was brought into force on the 1st January, 1900.

over French law had not arisen over the respective merits of two variant Western schools of jurisprudence, but had been

'a deep-seated conflict between two fundamental ideas of law. The immediate enforcement party contended for the juristic idea embodied in the theory of the school of Natural Law, namely that Law was based upon Human Nature, that it is of a universal character, and that, inasmuch as the codification of a civilised country like France was a refined expression of Human Nature or of the universal character of Law, it could be adopted by Japan. The postponement party stood for the juristic idea of the historical school, that Law, like Language, was an expression of national character and a product of History, and that the introduction of a foreign code into Japanese Society was absurd and preposterous.'¹

On the 16th May, 1892, the majority in the Japanese Diet showed their impartial hostility towards exotic law of all varieties by voting for the postponement of the coming into force, not only of a French-inspired civil code, but of a German-inspired commercial code, which they had already condemned to a first period of postponement in a previous vote on the 16th December, 1890. Nevertheless, in the Japanese civil code that was eventually brought into force in 1898, as well as in the commercial code brought into force in 1899, it was a German, not a Japanese, influence that replaced the French; and this eventual adoption, in Japan, of a German instead of a French model might be read as the opening of a new chapter in the history of the dissemination of Western Law. For the German Civil Code was likewise taken as the basis for the Swiss Civil Code adopted on the 10th December, 1907, and brought into force on the 1st January, 1912; and the Turkish Civil Code, adopted on the 17th February, 1926, was, in its turn, virtually a translation of the Swiss.

The German Civil Code was, indeed, a more scientifically executed piece of work than its famous French forerunner; yet, even if the outlook for German cultural influence abroad had not been blighted by the sinister military and political events of A.D. 1914-45, the ghosts of Napoleon's draftsmen might, not unjustly, have booked the German Civil Code's successes to the credit of their French account. The workmanlike instrument that saw the light in Germany in A.D. 1895 could never have emerged out of the 'hybrid miscellany' of German customary law if the *Code Napoléon* had not pegged out a drove-road for ruminant German jurists to follow; and it would have been surprising, after all, if this German cud had not been well digested when it had been chewed for more than ninety years.

The Normal Failure of Codification to arrest Decay

In any case, whatever verdict History might eventually pronounce on the respective merits and achievements of the Revolutionary French Code and its slow-footed German competitor, our glance at the *Code Napoléon's* nineteenth-century history has perhaps made it evident that

¹ Takayanagi, Kenzo: *Reception and Influence of Occidental Legal Ideas in Japan* (Tokyo 1929, The Japanese Council, Institute of Pacific Relations), p. 11.

this ninety-years-long triumphal progress from Paris to New Orleans and Buenos Aires and Cairo and Tokyo was the exceptional result of peculiar historical circumstances. As a rule—and this rule is inherent in the very nature of the declines and falls of civilizations—the demand for codification reaches its climax in the penultimate age before a social catastrophe, long after the peak of achievement in jurisprudence has been passed, and when the legislators of the day are irretrievably on the run in a losing battle with ungovernable forces of destruction. Justinian himself had no sooner turned at bay against Fate, and thrown up in her face the imposing barricade of his *Corpus Iuris*, than he was driven by the Fury's relentless hounds to sprint on again in a paper-chase in which he was constrained to strew the course with the tell-tale sheets of his *Novellae*. Yet in the long run Fate is apt to deal kindly with the codifiers, even when they have not shared Napoleon's fortune in being moved to do their work at an exceptionally auspicious hour; for the mead of admiration which their outraged predecessors would have refused, with indignation, to accord to them has been offered to their *manes*, in full and overflowing measure, by a Posterity that has been too remote, too barbarous, or too sentimental to be capable of arriving at a soberly correct appraisal of the codifiers' work.

Even this uncritically admiring Posterity, however, finds the consecrated codes impossible to apply in real life until they have suffered a sea change; for it is the tragedy of the codifiers that, in reducing the law of a happier and more cultivated past age to the social, moral, and intellectual level of their own melancholy generation, they have still pegged it so high that it is bound to pass forthwith beyond the reach¹ of a herd running violently down a steep place into the sea.²

'In the parts in which they were borrowing from the classical law—of which they preserved many useful rules—as well as in Justinian's own personal constitutions and in the interpolations, the [Justinianean] commissioners succeeded, notwithstanding the difficulties of their task, in producing a work which, without being free from contradictions and obscurities, was better suited to the needs of the populations of their countries than were the admirable classical masterpieces. One might even say that, in itself, this work was still too strong meat for the juridically uncultivated minds to which it was addressed. In the East it does not appear to have succeeded in dethroning the Syro-Roman Customal, which was unquestionably less scientific. In the West its only effect on legal practice was by way of glosses which were never more than mediocre before the study of the Justinianean Law received its impulsion from the School of Bologna.'³

In the last phase of the Roman Empire in its last strongholds, Justinian's reign was promptly followed by a deluge of Lombard, Slav, and Arab barbarian invasion; in the last phase of the Empire of Sumer and Akkad, Hammurabi's strenuous work of political and social reclamation on the plains of Shinar was no less promptly waterlogged by a Kassite

¹ See V. vi. 224, with n. 3.

inundation from the hills; in the Andean World the rule of the Inca law-givers was brought to a sudden end by the calamity of the Spanish conquest. Even in the Anatolian core of Justinian's empire, when Leo the Restorer and his successors set to work, after a virtual interregnum of 150 years, to replace the wreckage of Justinian's pretentious imperial edifice by something more modest, more practical, and, above all, more firmly based, they found apter materials in the Mosaic Law than in the Justinianean *Corpus Iuris* for meeting the simple needs of a new society that was struggling to be born under their aegis.¹ In Italy, whom Justinian succeeded in 'liberating' momentarily from barbarian rule at the cost of finally wrecking her social structure and her cultural life, the immediate future lay, not with the secular *Corpus Iuris*,² but with the monastic rule of Saint Benedict,³ which was conceived during the agony of the Great Romano-Gothic War (*gerebatur* A.D. 537-53) and was disseminated to Ultima Thule before Monte Cassino was laid desolate by the Lombards. In the former Transalpine provinces of the Roman Empire that Justinian neither inherited from his imperial predecessors nor reconquered from barbarian war-bands, the Justinianean *Corpus Iuris* did not, of course, obtain even the short-lived currency that it enjoyed in Italy and North-West Africa pending the undoing of Justinian's work there by the Lombards and the Arabs.⁴

The Decay of the Roman Law in the Roman Empire's Teutonic Barbarian Successor-states

In these lost and never even temporarily recovered Transalpine dominions of Rome a Roman subject population was permitted, by the indulgence or indifference of its new barbarian masters, to continue to live under Roman civil law in its locally prevalent pre-Justinianean embodiments; and the milder and more statesmanlike of the emperors' barbarian successors went so far as to anticipate Justinian by promulgating local codes of Roman Law—a *Lex Romana Burgundionum* and a Visigothic *Breviarium Alarici*—for the use of their Roman sheep without a jurisprudent shepherd. The *Breviarium* of the Visigoth King Alaric II, which was mainly based on the Theodosian Code, had also actually preserved extracts from the *Sententiae* of the Severan jurist Paulus which would have been lost to latter-day scholars if the sole surviving

¹ See III. iii. 276 and X. ix. 21-27.

² Collinet, in op. cit., vol. cit., points out that Italy had not yet come under Justinian's rule at the time—A.D. 528-34—when Justinian's *Corpus Iuris* was being compiled (p. 11); and that no Italian jurists were included in the board of commissioners by whom the work of codification was carried out (p. 13). Justinian's legislation did not apply to Italy automatically; it was made applicable there by express provisions, and this only *pari passu* with the progress of the reconquest (p. 12). At the same time, Collinet suggests elsewhere that an already formed design of reconquering Italy may have been one of Justinian's motives in compiling his *Corpus Iuris*. While he did not draw upon the local Italian version of the Roman Law, he did wish to provide himself with a *Corpus Iuris* that would be applicable in Italy (Collinet: 'The General Considerations raised by the Codification of Justinian', in *Tijdschrift voor Rechtsgeschiedenis*, vol. iv (Haarlem 1923, Tjeenk Willink), pp. 7-8).

³ See III. iii. 265-7 and V. vi. 224, n. 3.

⁴ This point is brought out by Burns, C. Delisle: *The First Europe* (London 1947, Allen & Unwin), p. 326.

official anthology of the masterpieces of Roman jurisprudence had been Tribonian's *Digest*. In the first phase of the Visigothic régime in Southern Gaul and Spain, King Euric I (*regnabat* A.D. 466-84) enlisted the services of Sidonius Apollinaris' friend and correspondent the Roman jurist Leo of Narbonne.¹ Yet this precarious survival of Roman Law in the West was limited in its range and, even within those limits, was a wasting asset. Roman subjects of Teutonic barbarian successor-states were subjected, it would seem, from the outset, to a regressive barbarian criminal law providing for the payment of a *wergeld* to the injured party or his heirs, in lieu of punishments imposed and exacted by the state;² and, though, in the deliberately conciliatory common law for Romans and Burgundians that was embodied in the Burgundian war-lord Gundobad's *Liber Constitutionum*,³ the invidious differentiation of scales of *wergeld* was based on differences of class and not of community, in the *wergeld* tariff of the ultra-barbarous Frankish *Lex Salica* 'the life of an ordinary Frank' was 'reckoned worth double that of a Roman'.⁴ What is still more significant, the Roman Law was now in retreat even in the tolerated departments of business relations and 'personal statute'.

'The Roman Law survived, but it sank to the level of custom.'⁵ Since

¹ See Apollinaris, Sidonius: *Epistulae*, Book VIII, Letter iii, § 3.

² See Lot, F.: *Les Invasions Germaniques* (Paris 1935, Payot), pp. 166-8.

³ In Southern Gaul at the turn of the fifth and sixth centuries of the Christian Era the subject Romans gained a notable improvement in their legal status from the play of power politics between their barbarian masters of the moment—the Nomadicized East German Burgundians and Visigoths—and the neighbouring Frankish backwoodsmen from the Lower Rhineland, who, under Clovis' leadership, were now showing themselves formidably aggressive. In the preface to the Burgundian *Liber Constitutionum* it is declared to be the king's benevolent intention to secure justice, unalloyed by either corruption or communal inequality, for Burgundians and Romans alike, by providing a common law for cases between a Burgundian and a Roman, and a separate code for cases in which both parties are Romans (see Dill, Sir S.: *Roman Society in Gaul in the Merovingian Age* (London 1926, Macmillan), p. 65). This Burgundian profession of virtue is borne out by the sixth-century Gallic Roman historian Gregory of Tours. '[Gundobadus] Burgundionibus leges mitiores instituit, ne Romanos opprimerent' (*Historia Francorum*, Book II, chap. 9, *ad fin.*); and the evidence is impressive when a Roman and Francophil Catholic ecclesiastic testifies in favour of a barbarian and Arian Burgundian war-lord whose dynasty had been suppressed by Gregory's Frankish patrons by the time when Gregory was writing. Dill (op. cit., p. 63) dates the first edition of Gundobad's *Liber Constitutionum* about A.D. 501; Burns (op. cit., p. 330) about 503 (the dating turns on an article, dated the 28th May, 502, which appears in the final edition). The *Breviarium* of the Burgundian Gundobad's Visigoth contemporary Alaric II (*regnabat* A.D. 484-507) is dated by Dill (op. cit., p. 94) and by Burns (op. cit., p. 330) *circa* A.D. 506, on the eve of the Battle of Vouillé. This battle, which was fought in A.D. 507, resulted in the conquest of all Southern Gaul save Septimania from the Visigoths by the Franks (see II. ii. 166, 380, and 428; V. v. 217, n. 1, and 221, 225-6). The Burgundian principality had suffered its first Frankish invasion in A.D. 500. These coincidences of date bear out the view that at the turn of the century the Visigothic and Burgundian governments were attempting to offset the odium of their heretical Arian faith by granting genuine equality before the law to their Catholic Roman subjects. Though their conciliatory policy did not induce the Catholic Roman clergy in their dominions to cease working for the victory of their own barbarous Frankish convert Clovis, some of the Roman laity felt differently. A grandson of Sidonius Apollinaris fell at Vouillé fighting for the Visigoths; and, though, when the converted Franks conquered Aquitaine and Burgundy, they left in force the liberal *Breviarium Alarici* and *Lex Romana Burgundionum* and *Liber Constitutionum Gundobadi* that had been enacted by their Visigoth and Burgundian victims, the Aquitanians chafed under the Frankish yoke for centuries thereafter. The Catholic clergy, however, were privileged in all contingencies. Under the barbarian law of the Riparian Franks it cost four times as much to kill even a sub-deacon, and nine times as much to kill a bishop, as to kill an ordinary Roman layman (Burns, op. cit., p. 336).

⁴ Dill, op. cit., p. 47; cp. Lot, op. cit., p. 195.

⁵ Cp. Collinet, op. cit., vol. cit., pp. 312-13.—A.J.T.

the Empire had disappeared, there was no longer any legislation to put fresh life into the old law by adapting it to new necessities.¹

In the sixth century [of the Christian Era] in the West, the destinies of Roman Law were dominated by one key phenomenon: an arrest in the development of the classical law. When we analyse this phenomenon in order to examine it in its diverse aspects, we can see that there are three elements in it: a traditional persistence of the classical institutions;² an evolution of these institutions in which there is nothing creative; and, as an inexorable consequence of these first two facts, a general regression in legal standards. . . .

The full measure of the feebleness of the evolution comes to light when one measures it by this sixth-century Western World's needs. In the troubled period that marks the end of the Ancient World and ushers in the Middle Ages, the new needs were numerous and pressing. In whatever direction one turns one's eyes—towards the political, the economic, the moral or the religious situation—one sees nothing but the overthrow of the ancient traditional order, the Roman order, of things. At this decisive moment in history, did Italy and Gaul, to confine our attention to them, make any attempt to satisfy these needs in so far as they affected private law? When it had become clear that the barbarian conquest had come to stay, the accomplishment of [legal] reforms that would have sufficed to bring the law in force into harmony with the new way of life—a harmony that was imperatively required—called for energetic and intelligent men (such as were the feudal jurists of a later age) who would labour diligently to bring the [necessary] evolution to pass. Evolution does not take place without effort, and is never automatic. The times called for someone with the courage to apply the pick-axe to the dilapidated edifice of law, and with the authority and ability to build up a new edifice [in place of the old one]. But this was something beyond the powers of the men of [sixth-century] Italy and Gaul. Their impotence is attested by the decadence which had brought them under the yoke of their new masters and had opened the way for the profound transformation of economic life. . . .

'The West [in the sixth century] was "a static society in which nothing could die because nothing was coming to birth there any longer". In this static world, stagnation and decadence had incontestably gained the upper hand over progress. This is the spectacle presented by Roman Law in Italy and Gaul at the very moment when the names of Constantinople and Justinian were lighting up the World with their lustre.'³

Thus, in the last chapter of the history of Roman Law in the West, the Theodosian Code played a dwindling part and the Justinianean *Corpus* no part at all. In Western and Orthodox Christendom alike, the Justinianean *Corpus* eventually came into its own, not by showing itself proof against death, but by surmounting a *vitai pausa*⁴ through a feat of hibernation. Though in Italy as a whole the *Corpus* had an innings of no more than fifteen years (reckoning from the end, in

¹ Lot, *op. cit.*, p. 166.

² e.g. *mancipatio*, which was abolished by Justinian, persisted in Italy down to the ninth century of the Christian Era (Collinet, *op. cit.*, vol. cit., p. 216). *Dictio dotis*, which was likewise abolished by Justinian, was retained by Alaric in his *Breviarium* (*ibid.*, p. 220). See further *ibid.*, p. 308.—A.J.T.

⁴ Lucretius: *De Rerum Natura*, Book III, l. 930.

A.D. 553, of the Ostrogoths' last stand to the beginning, in A.D. 568, of a piecemeal Lombard conquest), it came to life again, some four hundred years later, in an eleventh-century juristic renaissance at Bologna, the principal city in the bridgehead which the Constantinopolitan Government's Italian exarchs had maintained till A.D. 751 in the hinterland of Ravenna. From there from that time onwards, Tribonian's work radiated its influence into extremities and extensions of an expanding Western World that had lain beyond the political horizon not only of Justinian but of Trajan; and, thanks to Bologna's capacity, in the Dark Ages, for intellectual cold storage, a version of Roman Law was eventually 'received' in Modern Holland, Scotland, and South Africa. In Orthodox Christendom the Justinianean *Corpus Iuris* survived, with greater ease, the less exacting ordeal of hibernating for three centuries at Constantinople, and re-emerged in the tenth century of the Christian Era in the Imperial Code (*Vasiliká*) by which the Emperors of the Macedonian Dynasty replaced the Mosaic legislation of their eighth-century Syrian predecessors. These parallel juristic renaissances in Orthodox and in Western Christendom will occupy our attention in a later Part of this Study.¹ In the present place we are inquiring into cases in which the juristic legacy of a defunct universal state has been inherited direct, not rediscovered as a treasure-trove.

The Failure of the Spanish Empire of the Indies to profit by the Law of the Incaic and Aztec Empires

In the broken history of the Andean universal state, we have seen² that some vestiges of the oecumenical law of the Incas did find their way into the heterogeneous and ill-digested *corpus iuris* of the Spanish Empire of the Indies, but the greater part of this precious Incaic legal heritage, which had been so carefully adapted by its authors to the social needs of the Andean World, was sacrificed by the destructiveness of the *conquistadores* and the unimaginativeness of their more reputable successors the *licenciados*. It is true that among the legal advisers of the Spanish Crown in the Indies there were individuals who saw that

'the most difficult problems . . . were those arising from the government of an Indian population which could not be reduced to the norms of Spanish law. Juan Matienzo, judge in the Audiencia of Charcas and intimate adviser to [the Viceroy] Toledo (*proconsulari munere fungebatur* A.D. 1569-81), in his celebrated text-book of Peruvian administration, *Gobierno del Perú* (circa A.D. 1570), warns the Spanish authorities not "to try and change the customs abruptly and make new laws and ordinances, until they know the conditions and customs of the natives of the country and of the Spaniards who dwell there; for, as the country is large, so customs and tempers differ. One must first accommodate oneself to the customs of those one wishes to govern and proceed agreeably to them until, having won their confidence and good opinion, with the authority thus secured one may undertake to change the customs." ³

¹ See X. ix. 27-34.

² On p. 265, above.

³ Haring, C. H.: *The Spanish Empire in America* (New York 1947, Oxford University Press), p. 110.

But the indigenous customs that were incorporated into Spanish colonial law on the strength of such considerations as those set forth by Matienzo

'had to do, naturally enough, with the life of the lower orders of society: the regulation of labour, the succession and the privileges of native chiefs, Indian village organisation, agricultural practices, etc. . . . Basically . . . people in the Indies, especially in the domain of private law, lived according to the same judicial criteria as in Spain.'¹

The Infusion of a Decadent Roman Law into the Customary Law of the Roman Empire's Teutonic Barbarian Conquerors

In the more usual situation in which the aggressors who have snatched the sceptre out of the hands of the rulers of a universal state are not the representatives of some alien civilization, but are barbarians, we should expect *à priori* to see the governments of the barbarian successor-states take over much more of the juristic heritage of a former oecumenical Power which has eventually succumbed to force of barbarian arms without having lost its cultural prestige in barbarian eyes. We have, indeed, noticed already² that in the Teutonic barbarian successor-states of the Roman Empire the new masters were ready to allow their Roman subjects to continue to live under Roman Civil Law. On the other hand the barbarians' impulse to maintain a distinctive communal culture of their own in the alien social environment in which they have placed themselves through their conquests is apt to declare itself in the field of law, as well as in the fields of religion and poetry in which we have studied it in another context.³

The extant collections of the laws of divers Teutonic war-bands on ex-Roman ground gave a latter-day student the impression that these barbarians wanted to accommodate themselves to their new social environment with as little change in their own traditional life as local circumstances might allow. The most archaic of these collections was the Frankish *Lex Saliica*;⁴ but the same imperviousness to Roman influence was displayed in the rather more sophisticated provisions of the other law-books which had been put into their final form at a later date: for instance, the laws of the Riparian Franks, the Alamanni, the Bavarians, the Frisians, the Lombard conquerors of Italy, and the English conquerors of Britain. The backbone of these laws consisted of such utterly un-Roman institutions as ordeal by battle and the atonement for crimes of violence by the payment of compensation to the injured party or his heirs.⁵ This contrast in character between the sophisticated Roman Law of a moribund Hellenic World and the archaic barbarian law of the Teutonic war-bands who had settled on the Roman Empire's derelict provinces had its counterpart in a corresponding contrast between the Sumerian Law, as mirrored in Hammurabi's Code, and the law of the

⁴ An illuminating survey and analysis of the history of this institution among the Teutonic barbarian invaders of the Roman Empire and their successors is given by Phillpotts, B. S.: *Kindred and Clan* (Cambridge 1913, University Press).

⁵ On pp. 280-1, above.

Hittite barbarians who had settled on a moribund Sumeric World's Anatolian fringes. The difference in the spirit of the law was here two-fold. From one point of view the Hittite Law gave the impression of being more advanced than the Sumerian; for, whereas in Hammurabi's Code the punishments prescribed were savage and, in particular, the *lex talionis* was worked out to forbiddingly pedantic extremes,¹ the Hittite law substituted fines for Hammurabi's sentences of death or mutilation as the penalty for a number of offences.² From another point of view, however, the Hittite Law represented a regression; for, in dealing with crimes against persons, it substituted a tariff of *wergeld* for the punishments, to be imposed and exacted by the state, that had been prescribed for the same crimes by Hammurabi.³

What were the prospects of life for these barbarian systems of law on the alien ground of a decadent civilization whose domain the barbarians had overrun? The Hittite Law, in the redaction in which it happened to have been disinterred by twentieth-century Western archaeologists, dated from the later days of the second phase of Hittite history, for which the Carolingian Age of Western history would be the Frankish equivalent both in cultural terms of the contemporary state of society and in chronological terms of the passage of time since the emergence of a nascent new civilization out of a cultural interregnum.⁴ Here we have an historical example of a law of barbarian origin successfully providing for the needs of a civilization in the first chapter of its history. Beyond this point, however, Hittite history does not carry us; for, not long after the date at which the Hittite Code was promulgated in the redaction that had been unearthed, the homeland of the Hittite Society in Eastern Anatolia was overwhelmed by a barbarian *Völkerwanderung* from the Balkan Peninsula and the Aegean which had been set in motion by the catastrophic dissolution of the neighbouring Minoan Society, and thereafter the Hittite Civilization lingered on only in refugee communities, beyond the Taurus in Northern Syria and overseas along the

¹ The articles in which it was applied are set out in Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), p. 24, n. 2.

² See Hrozný, B.: *Die Älteste Geschichte Vorderasiens und Indiens* (Prague 1943, Melantrich), pp. 114 and 167; Götze, A.: *Hethiter, Churriter und Assyrer* (Oslo 1936, Aschehoug), pp. 64-65; Delaporte, L.: *Les Hittites* (Paris 1936, La Renaissance du Livre), p. 231.

³ See Cavaignac, E.: *Le Problème Hittite* (Paris 1936, Leroux), p. 105. The institution of *wergeld* thus turns out to be a common feature of Teutonic and Hittite barbarian law. 'The idea of settling conflicts by a money indemnity is not peculiar to the Germans. It is found among other peoples and is of a high antiquity. We come across it already, fourteen centuries before the beginning of our Era, among the Hittites of Asia Minor' (Lot, F.: *Les Invasions Germaniques* (Paris 1935, Payot), p. 166).

⁴ This Hittite law, as latter-day Western students had it, was a code drafted in the language of the Power that had exercised political hegemony over the Hittite World from the sixteenth century B.C. onwards. It was written in the Akkadian cuneiform script on two clay tablets, containing one hundred paragraphs each, which were discovered on the site of the Hittite Empire's capital, Boghazqaleh, in A.D. 1906-7. This redaction dated from the fifteenth century B.C. according to Hrozný, op. cit., pp. 166-7; from the thirteenth century according to Cavaignac, op. cit., p. 105. According to Delaporte, op. cit., p. 214, there were three successive redactions, of which the second was made in the fifteenth or fourteenth century B.C. English translations of the disinterred text will be found in Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), pp. 247-74, and in Pritchard, J. B.: *Ancient Near Eastern Texts* (Princeton 1950, University Press), pp. 188-97.

west coast of Italy, which were eventually absorbed by the Syriac and the Hellenic Society respectively.¹ It was as if, in the ninth century of the Christian Era, the collapse of the Carolingian Empire had resulted in the destruction of the nascent Western Christian Civilization at the hands of Scandinavian, Eurasian Nomad, and Muslim Arab invaders. If we are to follow the fortunes of barbarian law in a growing civilization farther than this point, we must turn from Hittite to Western history, where we find the law of the English barbarian settlers on ex-Roman ground in Britain succeeding, without any deliberate or systematic 'reception' of Roman law at any stage,² in developing sufficiently, out of its own resources, to be able to provide for the needs of a civilization that has arrived at a high degree of social sophistication and economic complexity.

This unique ability of the English Common Law to keep pace with the growth of the Western Civilization could be explained as the effect of three distinct causes. In the first place, at the time of the post-Hellenic Völkerwanderung, the barbarian law of the English invaders of Britain was largely relieved of such hampering archaic institutions as *wergeld* thanks to the exceptionally rapid disintegration of the kin-group organization of society in a migration across the sea.³ In the second place the ex-Roman population did not, in Britain, survive under barbarian rule as a distinct community, continuing to live under its own Roman law, as it survived in the Continental Teutonic successor-states of the Roman Empire. In Britain the provincials were exterminated, expelled, or assimilated by the English settlers. In the third place, at the opening of the second chapter of Western history towards the close of the eleventh century of the Christian Era the English law was carried forward and, above all, was effectively enforced, thanks to the exceptionally strong and efficient monarchy that was imposed on a politically united England by a Norman conquest. The survival of the English Common Law, however, was an exception that proved a rule; for the ancestral law of the other Teutonic barbarian invaders of the Roman Empire failed to stay the course. In all other cases we find Roman influence seeping in from an early date.

To begin with, the earliest versions of all the Teutonic law-books, with the significant exception of the English, were drafted in Latin; and, when we turn our attention from this point of form to matters of substance, we catch glimpses of Teutonic custom fighting a stubborn rear-guard action against the moral pressure of Roman concepts and Christian standards. The comparatively enlightened King Liutprand of the ultra-barbarian Lombards declares frankly, in a law promulgated in A.D. 731, 163 years after the Lombards' eruption into the comparatively highly cultivated social environment of Italy, that ordeal by battle is a Lombard

¹ See I. i. 114-15; III. iii. 139; IV. iv. 109; V. v. 88; and IX. viii. 438-9.

² This is not, of course, to say that 'the Common Law' of England remained impervious to the influence of Roman Law after this influence had become prevalent in Western Christendom as a whole in consequence of the Justinianean juristic renaissance at Bologna in the eleventh century of the Christian Era (see X. ix. 31-34).

³ On this point, see the passage quoted from Phillpotts, *op. cit.*, pp. 257-65, in the present Study, II. ii. 90-91.

custom which it is beyond his power to ban, though he is 'uncertain of the judgment of God and' has 'heard that many litigants have unjustly lost their case through' this practice.¹ On the other hand the genial Burgundians had mellowed under Roman influence within less than a hundred years of their crossing the Rhine.

'There is hardly a trace of German ideas or institutions in the legislation of Gundobad.² He has no resemblance to the old German chief, surrounded by his assembled warriors. His type and model is the political authority wielded by the Emperor or the great Praetorian Prefects. . . . In the Salian Law pecuniary compensation is almost universal: other punishments are almost unheard of. In Burgundy, besides the pecuniary sanction, there are many and various punishments for crime, some of them even harsh and cruel. This, however, it has been observed, does not prove a less civilised social tone, but rather the reverse.³ The Burgundian legislator, in fact, is striving to abolish the vindictiveness of private conflicts by making the state the avenger of personal wrongs.⁴

The Burgundian *Liber Constitutionum* marked a radical departure from archaic Teutonic law not only in its character but in its application; for, while the *Lex Salica* and other Teutonic law-books of that type were merely communal prescriptions for the exclusive use of an intrusive barbarian war-band, Gundobad and Sigismund were enacting, as we have observed already, a 'common law' for their barbarian Burgundian followers and their Roman subjects. The *Edictum Theodorici*,⁵ which was promulgated in the Ostrogothic dominions at about the same date, either *circa* A.D. 500 or *circa* A.D. 511-15,⁶ was a 'common law' in the same sense of applying alike to Theodoric's Ostrogoth followers and to the Roman population under his rule; and in this case the scales already incline heavily in the Romans' favour. The contents of this barbarian war-lord's edict are drawn from Roman sources—the Theodosian Code and the *Sententiae* of Paulus—and the Ostrogoth masters of Italy are referred to as 'barbarians' throughout the document. It is even more remarkable that the Visigothic *Breviarium Alarici*, which was promulgated within a few years of Theodoric's *Edictum* and Gundobad's *Liber Constitutionum* and was compiled, from the same sources as Theodoric's work, avowedly for the benefit of the Visigoths' Roman subjects, declares in its preamble that its prescriptions apply to 'both Romans and barbarians'.⁷

The promulgation of these three codes of 'common law' by Teutonic war-lords on ex-Roman ground at the opening of the sixth century of

¹ *Liutprandi Leges*, cxviii: 'Incerti sumus de iudicio Dei, et multos audivimus per pugnam sine iusticiam [sic] causam suam perdere, sed, propter consuetudinem gentis nostrae Langobardorum, legem ipsam mutare non possumus.'

² i.e. in his 'common law' for Burgundians and Romans (see p. 281, above). His version of Roman Civil Law for the use of his Roman subjects among themselves is not in question here.—A.J.T.

³ Compare the corresponding contrast between the salutary severity of Hammurabi's Code and the inexpedient laxity of the Hittite Code, to which attention has been drawn above.—A.J.T.

⁷ Burns, C. D.: *The Law of Europe* (London 1947, Allen & Unwin), pp. 329-30.

the Christian Era was only the beginning of the transfusion of Roman law into the body of Teutonic custom. In the unstable social situation produced by the establishment of barbarian rule over Roman populations, legislation could not stand still. The rulers of the Teutonic barbarian successor-states followed the example of their Imperial Roman predecessors, from the Emperor Hadrian onwards, by issuing a spate of decrees; and these decrees, in their turn, were inevitably coloured by the legal traditions of their Roman social setting. The classic example is the corpus of rescripts, issued in Theodoric's name, which were largely drafted, besides being collected and published, by the Ostrogoth war-lord's Roman minister Cassiodorus. The Ostrogothic régime in Italy, however, met with an early violent end at Roman hands, and the Iberian Peninsula under Visigothic rule was the place where the natural course of events had time to work itself out before the Visigothic Power was overthrown, in its turn, by the more competent rival hands of the Visigoths' fellow barbarian invaders the Primitive Muslim Arabs.

The Visigothic King Receswinth (*regnabat* A.D. 649-72) restored to the former Roman territories under his rule the uniformity of law that they had enjoyed from the time of Caracalla until the Visigothic conquest. In A.D. 654 he put out of commission the *Breviarium* of his predecessor Alaric II (*regnabat* A.D. 484-507) and gave sole force of law to a code¹ compiling the decisions of the Visigothic Kings from Euric down to Receswinth himself.

'These decisions are thoroughly imbued with the spirit of Roman Law. . . . Where else [in the field of Teutonic barbarian legislation] can one find anything comparable to Book I [of Receswinth's *Forum*], entitled *De Legislatore, De Lege*, in which an effort is made to formulate general principles of legislation?'²

The end of the story was the blending of Roman with Teutonic law in as many different mixtures³ as there were local customary laws⁴ in Medieval Western Christendom.⁵

The Infusion of a Decadent Roman Law into the Islamic Shari'ah

This infusion of Roman Law into the custom of Teutonic barbarians who had no future was, however, neither so important an event nor so striking a feat as its surreptitious and unavowed yet unmistakable infiltration into the Islamic law of the Arab barbarian conquerors of other ex-Roman territories. The two elements that blended here were even more incongruous, and the result of their blending was the creation, not

¹ Known under the alternative names of *Liber Iudicum* and *Forum Iudiciorum*, and eventually translated into Castilian as the *Fuero Jueazgo*.

² Lot, F.: *Les Invasions Germaniques* (Paris 1935, Payot), pp. 182-3.

³ The close resemblance of medieval Spanish customary law to Scandinavian law leads Lot (op. cit., p. 183) to surmise that, in the Visigothic dominions, an unwritten Gothic customary law survived both the *Breviarium Alarici* and Receswinth's *Forum Iudiciorum*.

⁴ In France, this diversity of local customary laws survived even the effective political unification of the kingdom and was only ironed out by the legislation of the 'iconoclastic assemblies' convened by the Revolution.

⁵ The main contributions of Roman Law on the one side and Teutonic Law on the other are set out by Lot, op. cit., pp. 245-7.

just of a parochial law for a barbarian successor-state of the Roman Empire, but of an oecumenical law which was to serve the needs of a restored Syriac universal state and, after surviving the break-up of this political framework, was to govern and mould the life of an Islamic Society that, after the fall of the Caliphate, was to continue to expand until, at the time of writing, its domain had come to extend from Indonesia to Lithuania and from South Africa to China.

Unlike their pagan and Arian Teutonic counterparts, the Primitive Muslim Arabs had been roughly shaken out of their archaic traditional way of life before they administered to themselves the additional shock of a sudden change of social environment by bursting out of the deserts and oases of Arabia into the fields and cities of the Roman and Sasanian empires. A long-continuing radiation of Syriac and Hellenic cultural influences into Arabia had produced a cumulative social effect which had declared itself dramatically in the personal career of the Prophet Muhammad;¹ and his achievements had been so astonishing and his personality so potent that his oracles and acts, as recorded in the Qur'ān and the Traditions, were unquestioningly accepted by his followers as the source of law for regulating, not only the life of the Muslim community itself, but the relations between the Muslim conquerors and their at first many times more numerous non-Muslim subjects. The speed and sweep of the Muslim conquests—which brought half of what remained of the Roman Empire and the whole of the Sasanian Empire under the rule of Muhammad's successors within less than twenty years of the Prophet's death—conspired with the irrationality of the accepted basis of the Muslim empire-builders' new-laid law to create a problem which was hardly more awkward for the non-Muslim population of the Caliphate than it was for their Muslim masters; for, even when the Qur'ān was eked out by the Traditions, the task of wringing out of these unpromising materials an oecumenical law for a sophisticated society was as preposterous as the demands for welling water in the wilderness that the Children of Israel were said to have addressed to Moses.²

For a jurist in search of legal pabulum for sustaining social life, the Qur'ān was indeed stony ground. The chapters dating from the non-political Meccan period of Muhammad's mission, before the *Hijrah*, offered far less matter for the practical jurist than he would find in the New Testament; for this literary legacy of the politically disinterested first phase of the Prophet's career contained little beyond a patently sincere and monotonously reiterated declaration of the unity of God and denunciation of the moral and intellectual error of polytheism and idolatry. The chapters afterwards delivered at Medina might look, at first sight, more promising; for at the *Hijrah* Muhammad achieved in his own lifetime a position that was not attained by any follower of Jesus till the fourth century of the Christian Era;³ he became the head of a state, and his utterances during this Medinese period were mainly concerned with public business. Yet it would be at least as difficult to elicit

¹ See III. iii. 276-7.

² Exod. xvii. 1-7.

³ The difference between the respective political environments in which Christianity and Islam came to birth has been noticed in III. iii. 466-72.

a comprehensive system of law for a sophisticated society from the Medinese *surahs*, unsupplemented, as it would be to perform the same juristic conjuring trick with the Epistles of Saint Paul. Like the apostle-missionary, the apostle-podestà found that the flurry of improvising provisional solutions, *ad hoc*, for a ceaseless succession of emergencies, serious or trivial,¹ left him no breathing-space for attempting to sort out these stray sibylline leaves into anything like a comprehensive or systematic code. Yet, even if Muhammad had succeeded, where Paul had failed, in performing this superhuman labour, the result would have been of less practical use to the Arabian prophet's successors than a Pauline code would have been to the Christian Roman Emperors; for the private business of religious congregations in important cities of the Roman Empire in Paul's day actually had more in common with the public business of the Roman Empire in the fourth century of the Christian Era than had the public business of the agricultural, non-commercial, oasis-state of Medina under Muhammad's rule during the years A.D. 622-32 with the public business of the universal state, embracing all but a fraction of the Syriac World, of which Muhammad's thirty-third successor Mu'tamid found himself master upon his accession in A.D. 870.²

In these compelling circumstances the men of action who built the Arab Caliphate let theory take its chance and resorted to self-help. In a legal no-man's-land where the oracles of the Qur'ān were dumb and where even the beaten track (*Sunnah*) of concordant Tradition faded out, they found their way through by the aid of common sense, analogy, consensus, and custom.³

'In the oldest period of the development of Islam the authorities entrusted with the administration of justice and the conduct of the religious life had in most cases to fall back on the exercise of their own *ra'y* (common-sense personal judgment) owing to the scarcity of legislative material in the Qur'ān and the dearth of ancient precedents. This was regarded as a matter of course by everyone. . . . Corresponding to this recognition of *ra'y* as an approved source of law are the instructions ascribed to the Prophet and the early Caliphs, which they gave to the officials sent to administer justice in the conquered provinces. . . . In the digests which were developed from these simple origins we find deduction from decisions in allied cases expressly mentioned, i.e. the application of analogy (*qiyās*) as a methodical adjustment of equity (*ra'y*). . . .

'We have—there is evidence for it at a very early period—a kind of popular element adopted among the constitutive sources for the deduction

¹ For these characteristics of Muhammad's personal legislation in the Medinese *surahs*, see Margoliouth, D. S.: *The Early Development of Mohammedanism* (London 1914, Williams & Norgate), pp. 5 and 12. 'It has been noticed that the word which we ordinarily render "reveal", and which literally means "send down", is properly applied to royal rescripts; the suppliant "raises" a petition and the sovereign "sends down" the reply. The faithful at Medinah used to await fresh revelations each day somewhat as we in these days are on the look out for the morning paper.'

² i.e. three hundred years after the birth of Muhammad in A.D. 570.

³ 'It is likely that [Muhammad] meant current practice to continue except where his legislation had abrogated it' (Margoliouth, op. cit., p. 66). To begin with, the custom which counted for most was that of the Arabian oasis-dwellers and Nomads whose conquests re-established a Syriac universal state. The custom which eventually prevailed was that of the Arab empire-builders' converted subjects.

of laws: the conception of consensus (*ijmā'*), i.e. the general usage of the community which has been established by agreement in the larger circles of believers independent of the written, traditional or inferred law. . . .

'It was quite natural, from the changed conditions after the conquests, that the formation of the law, not only in its special provisions, but particularly in the point of view they adopted in their method of deductive operation as laid down in *fiqh* (Islamic jurisprudence), was greatly influenced by what the authorities on the development of law in Syria and Mesopotamia were able to learn of Roman Law, sometimes of the special laws for the particular provinces. It was obvious that a quite uncultured people, coming from a land in a primitive stage of social development into countries with an ancient civilization where they established themselves as rulers, would adopt from among their new surroundings as much of the customary law of the conquered lands as could be fitted in with the conditions created by the conquest and be compatible with the demands of new religious ideas. . . . The comparative study of one chapter of private law has yielded the most conclusive proofs of the thorough-going adoption of Roman Law by the jurists of Islam.¹ . . . Roman Law, however, does not exhaust the sources drawn upon in the development of Muslim Law. The receptive character that marks the formation and development of Islam also found expression, naturally first of all in matters of ritual, in borrowings from Jewish Law. According to [von] Kremer,² even many of the provisions of Roman Law that have been adopted by Islam only found a place in *fiqh* through the intermediary of the Jews.'³

The Mosaic Law's Debt to the Codification of the Sumeric Law by Hammurabi

This Jewish Law, which had so long a history behind it already by the time of Muhammad's *hijrah* from Mecca to Medina, had originated, like the Islamic *Shari'ah*, as the barbarian customary practice of Nomads who had broken out of the steppes of Northern Arabia into the fields and cities of Syria; and, for meeting the same emergency of an abrupt and extreme change of social environment, the primitive Israelites, like the Primitive Muslim Arabs, had recourse to the existing law of a sophisticated society which they found in operation in the Promised Land.

While the Decalogue—at any rate in a pristine form, in which all the Commandments were couched in the lapidary style still preserved in the Sixth, Seventh, and Eighth⁴—would appear, on the face of it, to be a native Hebrew product, the next piece of Israelite legislation, known to scholars as 'the Covenant Code',⁵ betrays its debt to the Code of Ham-

¹ Schmidt, F. F.: *Die Occupatio im Islamischen Recht*, reprinted from *Der Islam*, i (Strassburg 1910).

² Kremer, A. von: *Culturgeschichte des Orients* (Vienna 1875-7, Braumüller, 2 vols.), vol. i, p. 535; English translation by Khuda Bukhsh, S.: *The Orient under the Caliphs* (Calcutta 1920, University Press), chap. viii, 'The Origin and Development of Muslim Law', Section 6, 'The Sources of Muslim Law'.

The influence of local Medinese Jewish jurisprudence on the early school of Islamic jurisprudence at Medina is emphasized by Margoliouth, op. cit., p. 74: 'There is no evidence that Roman Law penetrated into this primitive city.'

³ Goldziher, I., in the *Encyclopaedia of Islam*, vol. ii (London 1927, Luzac), s.v. *Fikh*, quoted with the permission of the publishers.

⁴ A conjectural reconstruction of the whole Decalogue in this presumably original style will be found in Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), pp. 6-7.

⁵ The Covenant Code 'exists in two forms: one very short, viz. Exodus xxxiv, 17-26;

murabi more patently than the *Shari'ah* reveals its corresponding debt to a Syrian Roman law-book.

'It has been calculated that, out of forty-five, or possibly fifty-five, judgments preserved in this old Hebrew Law, thirty-five have points of contact with the Hammurabi Code, and quite half are parallel.'¹

This masterful influx of a code of Sumerian Law into legislation enacted at least nine centuries later in one of the local communities of a latter-day Syriac Society testified to the depth and tenacity of the roots which the Sumeric Civilization had struck in Syrian soil during the millennium ending in Hammurabi's generation. A First Syriac Civilization, affiliated to the Sumeric, had miscarried as a result of the insatiable aggressiveness of the Hyksos barbarians, who, not content with carving out for themselves a successor-state in the Syrian provinces of the Empire of Sumer and Akkad, had driven on into the Egyptian World and had thereby eventually brought down upon Syria an Egyptian counter-invasion.² On the political plane, Syria had been included, for two centuries, in a reinstituted Egyptian universal state and thereafter been partitioned, for two further centuries, between this Egyptian Power and a rival Hittite Empire. On the cultural plane the subject Syrian peoples, while continuing, down to the reign of the Egyptian Emperor Ikhnaton (*imperabat circa* 1380-1362 B.C.), to employ as their medium of literary expression the Akkadian language, conveyed in the cuneiform characters according to the Akkadian usage, had experimented in working out an Alphabet for the conveyance of their native Canaanite speech, and, after testing the adaptability of the cuneiform characters for alphabetic use,³ had discarded them in favour of the notation—possibly of Minoan origin—which they immortalized by creating the historic Alpha-

the other more extended, viz. Exodus xx, 23—xxiii, 33. This code is incorporated in two of the documents which compose the Hexateuch: Exodus xxxiv, 17-26, in the J document, and Exodus xx, 23—xxiii, 33, in the E document. These two documents arose in the latter part of the ninth century or the early part of the eighth century B.C., J being probably a half-century or so older than E' (Smith, *op. cit.*, p. 15).

¹ Johns, C. H. W.: *The Relations between the Laws of Babylonia and the Laws of the Hebrew Peoples* (London 1914, Milford), p. 49. In the third of the three lectures composing this book, the writer takes up the question whether the indubitable and, indeed, striking points of similarity between Hammurabi's Code and the Covenant Code are to be accounted for as products of a uniformity of Human Nature, in virtue of which we find different individuals or communities independently making similar responses to similar challenges, or whether these particular similarities are to be traced to a process of diffusion through which the Covenant Code has borrowed from Hammurabi's Code or both have borrowed from some common source. Johns' conclusion is that most of the matter which the Covenant Code shares with Hammurabi's Code has been borrowed by the Covenant Code from the earlier of the two compilations. He argues from the similarity, down to arbitrary details, of the provisions in the two codes concerning (i) debt slavery (Johns, *op. cit.*, pp. 56-60; *cp.* pp. 39-46) and (ii) the prescription of the penalty of burning alive for two particular offences (*op. cit.*, pp. 60-61), and from the grouping of the laws, in both codes, in sets of fives and tens (*op. cit.*, pp. 26-27 and 61). Thus, in Johns' view, Sumerian Law, as finally codified by Hammurabi, is the main common element in the two codes. He does, however, allow for a subsidiary common element in the shape of a primitive customary law of the Semite Nomads of Arabia which may have been imported independently by Hammurabi's Amorite ancestors into Shinar and by the Hebrews, in their turn, into Palestine, and have been injected, in both cases, by the Nomad conquerors into the existing law of the conquered sedentary population (*op. cit.*, pp. vi-vii, 28, and 32-33).

² See II. ii. 388-gr.
³ In this experiment, they were anticipating the work of the creator of the Medo-Persian cuneiform Alphabet, which was invented—to all appearance, quite independently—about a thousand years later (see p. 247, above).

bet out of it. Finally, the Syrians had struck out for themselves, in all departments of life, a new civilization of their own which was affiliated to the Minoan, and not to either the Sumeric or the Egyptian. Yet the Israelite Covenant Code is evidence that, through all these political and cultural revolutions in Syria, the Sumerian Law, as embodied in Hammurabi's Code, had remained in force among the descendants of Hammurabi's Syrian subjects—and this in such vigour as to impress itself imperiously upon the callow legislation of the Canaanites' Hebrew barbarian conquerors.¹

In thus entering into the law of barbarians who happened, exceptionally, to be incubators of a higher religion, the Sumerian Law, like the Roman Law, made a greater mark on history than when it was influencing barbarians whose destiny was the usual inglorious exit of their kind. At the time of writing, the Sumerian Law was still a living force in virtue solely of its Mosaic offprint. On the other hand, the Islamic *Sharī'ah* was neither the sole nor the liveliest living carrier² of the Roman Law at the same date. In the twentieth century of the Christian Era the chief direct heirs of the Roman Law were the canons of the Eastern Orthodox and Western Catholic Christian Churches. In the domain of law, as in other fields of social action, the master institution created by the internal proletariat was the universal state's principal beneficiary.

3. *Calendars; Weights and Measures; Money*

The Concern of Governments with Standard Measures

Generally accepted and effectively operative standard measures of time, distance, length, volume, weight, and value are necessities of social life at any level above the most primitive. They are needed not only by manufacturers, stock-breeders, and agriculturists, but by hunters of the higher type that does not simply wait passively for game to turn up, but pursues a strategy dependent on ability to forecast and anticipate its

¹ The Covenant Code was a selection from the Code of Hammurabi. 'There are 282 laws in the Code of Hammurabi, and only 50 in the Covenant Code' (Smith, op. cit., p. 18); and the selection had been made to suit the requirements of a much more backward society than that for which Hammurabi was legislating. 'The provisions in the case of each law in Hammurabi's Code are much more detailed and elaborate and presuppose a much greater experience with the practices of an advanced social and economic order' (ibid., p. 18). 'It would . . . seem that wages for service were higher in Hammurabi's day than when the Covenant Code was drawn up' (ibid., p. 19). The legislation in Hammurabi's Code on the subject of runaway slaves has no counterpart in the Covenant Code as we have it (ibid., p. 29). 'The Code of Hammurabi is much the more severe of the two and uses the penalty of capital punishment to a much greater extent' (ibid., p. 20), but, as we have seen in comparing the Hittite Code with Hammurabi's and the Teutonic barbarian laws with Roman Law, the absence of severe penalties may be evidence, not of humane feeling, but merely of impotence, on the legislator's part. Moreover, the law concerning the working off of debt by the enslavement of the debtor or members of his household to the creditor is less harsh in Hammurabi's Code than in the Covenant Code. Hammurabi's Code frees male and female debt-slaves alike after three years' service; the Covenant Code exacts six years' service from males and enslavement for life (with certain reservations and exceptions) from females (ibid., pp. 18-19). The Israelite laws prescribing the punishments for divers unnatural forms of sexual practice are likewise harsher than the corresponding provisions in the Hittite Code (see the comparative table in Cavaignac, E.: *Le Problème Hittite* (Paris 1936, Leroux), p. 109, n. 1).

² The continuous carriers of an institution are, of course, to be distinguished from reconverted renegades who have adopted the same institution *de novo* in a 'renaissance'.

victims' movements and behaviour. Social currencies of these kinds are older—perhaps far older—than governments; and they become matters of concern to governments as soon as these come into existence in their turn. The positive *raison d'être* of governments is to provide central political leadership for common social enterprises, and common enterprises cannot be operated without standard measures. Again, the negative *raison d'être* of governments is to ensure at least a modicum of justice in the private relations between their subjects, and, in most private issues of a 'business' kind, standard measures of some sort are involved. While governments thus find themselves implicated *ab initio* in the maintenance and enforcement of standard measures as one of their essential functions which they cannot afford to neglect, they also eventually discover that the administration of these institutions—for example, of the calendar at one end of the scale and of a coinage at the other—can be turned to account by them incidentally for the secondary purpose of moving their public in the direction of their policy.

In these various ways, standard measures concern governments of every species; but they are of particular concern to the governments of universal states for two reasons. In the first place, such governments start life as parvenus who have to take active steps to win the obedience, respect, and loyalty of subjects whom they have taken over, without consulting their wishes, from the former parochial states that they have overthrown and replaced by force. In the second place, universal states, by their very nature, are confronted with the problem of holding together far greater numbers of subjects and far wider areas of territory than any single one of their parochial predecessors; and for this reason, again, they have a special interest in the social unity and uniformity that standard measures promote when effectively enforced.

Calendrical Cycles

Of all the standard measures here in question, a standard system of registering time is the earliest felt and the most persistently imperative need; and the first necessity here is a measurement of the seasons of the year-cycle, which continues, even in technically advanced societies, to be the indispensable basis of Man's unceasing struggle to win a livelihood from Non-Human Nature.¹ But the problem of measuring the seasons soon carries the pioneer chronometrist into calculations of vastly longer aeons of Time than the single year-period within which the seasons revolve. The measurement of the seasons requires a harmonization of the three different natural cycles of the year, the month, and the day; the discovery that the ratios between these three cycles are not

¹ At first sight it might look as if Man's primeval servitude to the seasons had been thrown off in a Modern Western factory in which the temperature and atmosphere were 'conditioned' by artificial regulation and in which the machinery was worked by shifts of operatives for 24 hours in the day and for 365 days in the year. But this appearance of successfully contracting out of the tyranny of Nature was, of course, an illusion. Factories were fed by raw materials, and factory-workers by food, and in a Westernizing Modern World, no less than in the Higher Palaeolithic Society, the ultimate constituents of both food and raw materials had to be wrested from Nature. Moreover, this continuing war with Nature was still being waged, even in this technologically precocious society, by such 'higher hunters' as the trawler and the whaler, as well as by their younger brothers the husbandman and the shepherd.

simple fractions but surds leads a would-be harmonizer into thinking in terms of vaster cycles—the products, not of observation, but of reasoning—in which the elusive correspondences between the beginnings or between the ends of days, months, and years are found, by a mathematical computation, to recur after a formidably long lapse of time; and, when the habit of reckoning with these ampler periods leads the budding astronomer to take into his account the real or apparent cyclic movements of the planets and the ‘fixed’ stars, besides those of the Sun, Moon, and Earth, the chronological horizon recedes to a distance which is not easy to express and is still less easy to imagine—narrow-verged though it may seem to a latter-day cosmogonist in whose eyes our particular solar system is no more than one speck of star-dust in the Milky Way, and the Milky Way itself no more than one *ci-devant* nebula out of myriads of nebulae on their way from a flaming birth towards a deathly incineration.

Short of this latest stage in the mental exploration of chronological magnitudes, the ‘least common measure’ of the recurrent coincidences between the apparent movements of the Sun and those of a single one of the ‘fixed stars’ had generated the Egyptiac ‘Sothic Cycle’ of 1,460 years,¹ and a recurrent common cycle of the Sun, the Moon, and five planets the Babylonian *Magnus Annus*² of 432,000 years,³ while, in the

¹ These 1,460 years were ‘Sothic’ years: i.e. years reckoned from heliacal rising to heliacal rising of the star Sothis (Sirius), its heliacal rising being the first occasion in the year on which the star is visible above the horizon before dawn. Throughout the life-span of the Egyptiac Civilization the Sothic-year was virtually coincident in length with the Julian year of 365½ days, whereas the Egyptiac official year was a conventional one of 365 days. Thus a period of 1,460 Sothic years was exactly equal to a period of 1,461 official years, and in the course of a 1,460-years-long Sothic cycle the New Year’s Day of the official year would travel right round the Sothic year-clock. The mathematical device of controlling the palpably inaccurate conventional year by relating it to the much more nearly accurate Sothic year must have been inaugurated in—or been based retrospectively on—some year in which the New Year’s Day of the official year actually coincided with the heliacal rising of Sirius. In the latitude of Memphis in the fifth and fourth millennia B.C. this astronomical event occurred on the 19th July of the Julian Calendar, which in that age corresponded to the 15th June of the Gregorian Calendar—a date approximate to the Summer Solstice and also to the beginning of the annual rising of the Nile in the Lower Nile Valley and the Delta. It seems a fairly safe guess that, at the time when the official year of 365 days was first put into commission, it was set to begin on a date which was of such paramount importance for the whole life of the Egyptiac World. The Egyptiac official year did actually open on the 19th July of the Julian Calendar in each of the four-year periods A.D. 140/1–143/4, 1321/1320–1318/1317 B.C., 2781/2780–2778/2777 B.C., and 4241/4240–4238/4237 B.C. Since the Egyptiac Calendar, with its Sothic correction, is known to have been in use at both the two first-mentioned of these dates, the inaugural year—or retrospectively calculated starting-point—must fall within one or other of the two last-mentioned four-year periods. Eduard Meyer opts for the earlier of the two alternatives, i.e. 4241/4240–4238/4237 B.C., on the ground that, by the time of the Old Kingdom, the Calendar was already a long since established institution (see Meyer, E.: *Geschichte des Altertums*, vol. i, Part II, 3rd ed. (Stuttgart and Berlin 1913, Cotta), pp. 28–30).

² See IV. iv. 23–24 and 37, and V. v. 56–57.

³ *Quarum [stellarum] ex disparibus motionibus magnum annum mathematici nominaverunt, qui tum efficitur cum Solis et Lunae et quinque errantium ad eandem inter se comparisonem confectis omnium spatiis est facta conversio. Quae quam longa sit, magna quaestio est; esse vero certam et definitam necesse est’* (Cicero: *De Natura Deorum*, Book II, chap. 20).

‘Homines . . . populariter annum tantummodo Solis, id est unius astri, reditu metuntur; cum autem ad idem, unde semel profecta sunt, cuncta astra redierint, eandemque totius anni descriptionem longis intervallis retulerint, tum ille vere vertens annus appellari potest—in quo vix dicere audeo quam multa saecula hominum teneantur’ (Cicero: *Somnium Scipionis*, chap. 7 = *De Republica*, Book VI, chap. 22, in Cardinal Angelo Mai’s edition (Rome 1823, Mawman)).

³ This appears to have been the estimate that was traditional in the Babylonian school

stupendous Mayan Grand Cycle of 374,440 years, no less than ten distinct constituent cycles were geared together.¹

Governmental Methods of Keeping Count of Time

Governments, like astronomers, find themselves concerned with computations of terms of years, as well as with the seasonal articulation of the recurrent year-cycle. Their interest in the seasonal calendar is obvious, for it is the key not only to the livelihood of their subjects, for which governments are held responsible in the last resort, but also to their own ability to command the resources without which they cannot perform a government's recognized functions. Even in a technically advanced and highly industrialized state of society the parochial governments of a Westernized World in the year A.D. 1952 were having their policies dictated to them by the results of the last harvest and the prospects of the next one; and in simpler states of society this domination of weather over policy had made itself felt *a fortiori*. Governments had not been able to mobilize and maintain armies without a sufficient surplus of food stocks with which to feed them, and they had been constrained to time their military campaigns to coincide with the slack season of the agricultural year (whichever of the seasons this might happen to be in the particular climate in which their dominions were situate and under the particular system of agricultural production that was practised there).

In a state of society in which a money economy is either unknown or else only partially operative, the government even of a sedentary agricultural community may have to make an annual round of seasonal migrations to draw on food-supplies which, under the technological conditions of the time and place, are less mobile than even august human bodies. We have already taken note of the Achaemenian Court's regular distribution of its time between three different imperial residences.² The Merovingian Frankish rulers of the most barbarous of the Continental Teutonic successor-states of the Roman Empire in one of the most backward of the Empire's former territories used to roam from one estate to another of their royal domain in order to browse on the fat of the land. Where the government has been of Nomad origin and has brought with it, out of 'the desert' into 'the sown', a war-band of Nomad empire-builders who persist, *in partibus agricularum*, in following their ancestral way of life, this migratory dance of attendance on the

of astronomers (see Cumont, F.: *Les Religions Orientales dans le Paganisme Romain*, 4th ed. (Paris 1929, Geuthner), pp. 164 and 289). Macrobius, in his commentary on the *Somnium Scipionis*, II. 11, rushing in where Cicero had feared to tread, ventures on an estimate of his own in which he reckons the span of the Magnus Annus at 15,000 solar years, and Cicero himself had proposed a figure of 12,954 years in his *Hortensius* (inaccessible in A.D. 1952), according to Tacitus in his *Dialogus de Oratoribus*, chap. 16. Cicero's and Macrobius's shots fell much nearer the mark than their Babylonian predecessors' conscientious calculations, if the true figure is 25,817 solar years (see Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), p. 119).

¹ See Morley, S. G.: *The Ancient Maya* (Palo Alto, California 1946, Stanford University Press), pp. 262 and 289; Thompson, J. E. S.: *Maya Hieroglyphic Writing: Introduction* (Washington, D.C., 1950, Carnegie Institution of Washington), pp. 141-56. Like the Egyptian Sothic Cycle, the Mayan Grand Cycle was a device for correcting the inaccuracy of an official year of 365 days.

² See pp. 205-6, above.

seasons is, of course, a still more conspicuous feature of public business. Yet even the most primitive and rudimentary government cannot allow its enslavement to a tyrannous annual round to preoccupy its attention to the exclusion of all provision for reckoning in terms exceeding the length of a single year; for the first concern of every government is to keep itself in existence; the most incompetent government may last for a whole lifetime, and perhaps for a term spanning a number of successive generations; and the most naïve administration soon discovers that it cannot remain in business without keeping some permanent record of its acts.

For this purpose the gigantic astronomical cycles evolved by the chronometrists were, however, as useless as the miniature calendar of the annual round, since the spans of time to which the continuous acts of even the longest-lived governments had run had, in human history up to date, been of a lesser order of magnitude than even the relatively modest length of the Sothic period. Consequently, governments had had to work out methods of their own for dating events over a series of years.

One of their methods had been based on the distinctiveness of every individual human being and on the personal names in which this distinctive individuality was expressed. They had taken to dating their acts by the names of magistrates with an annual term of office, such as the Assyrian *limmu*, the Athenian *archôn epônymus*, and the Roman pair of consuls; alternatively they had dated them by the series of regnal years of successive sovereigns ruling (short of accidents) for life. This system of dating does effectively distinguish every year in the count from every other; its weakness is that, when the continuous life of the institution employed as a time-measure happens to be prolonged for 1,050 years, as the life of the Roman consulate was from the reputed date of its institution in 509 B.C. to its abolition by the Emperor Justinian in A.D. 541,¹ a list of eponymous magistrates becomes far too long to be retained in the memory with the ease with which it is possible, for example, to learn by heart the twenty-six letters of the Latin Alphabet in their arbitrary sequence; and in these circumstances the denotation of a date by the citation of the consuls of the year no longer suffices to call the date to mind without a tiresome search through a list of perhaps a thousand pairs of names. The reckoning by reigns is ultimately open to the same objection, even when the names of individual sovereigns are grouped together under the names of dynasties, and when each individual reign is articulated, not only into single regnal years but into tax-assessment periods each extending over a number of years (the fifteen-yearly 'indications' of the Later Roman Empire). The difficulty is not overcome by inventing an artificial cycle of official years with 'fancy' names, such as the Sinic cycle in which the years are named after animals (real and mythical) and other objects with auspicious associations; for, if the cycle is kept within the manageably short compass of

¹ See V. vi, 111 and 224. The life-span of the consulate would have to be reckoned as having been 990 years if we were to take as the initial date the traditional year, not of the inauguration of the institution itself (509 B.C.), but of its first restoration (449 B.C.).

the Latin Alphabet, it will recur so frequently that confusion will arise between one of its occurrences and another, while, if such confusion is to be avoided, this can only be done by drawing out the series towards the unmanageable length which the Roman consular *fasti* had reached by the year A.D. 541.

The only satisfactory way out is to adopt the different method of choosing some particular year as an initial date and reckoning subsequent years from that date onwards in a numerical sequence which can, if necessary, be continued *ad infinitum* without in any way diminishing the convenience of the system for ready reckoning.¹ The dates chosen as the starting-points for new eras had in some cases been those of events of which the authenticity and the time of occurrence had been established beyond dispute. Classical examples were the eras starting from the Fascist occupation of Rome on the 28th October, 1922; from the establishment of the First French Republic on the 22nd September, 1792; from the Prophet Muhammad's *hijrah* from Mecca to Medina on the 15th July, A.D. 622;² from the assumption of a formal claim to oecumenical authority in the Indic World by the Gupta Dynasty on the 26th February, A.D. 320; from the definitive establishment of the Seleucid Empire's Hasmonaean successor-state in Judaea in 142 B.C.; and from the triumphal re-entry of the founder of the Seleucid Monarchy, Seleucus Nicator, into Babylon in 312 B.C. (an event which, for chronometrical convenience, was retrospectively equated with the 1st of the Macedonian month Dios (October) of that year).

There were other cases in which eras had been reckoned from events of which the precise date had been disputable. For example, there was no evidence that Jesus had in fact been born in the first year of a Christian Era that did not become current in divers provinces of Western Christendom till divers dates in and after the sixth century from the birth of Christ according to this computation;³ there was likewise no evidence that the city of Rome had in fact been founded in the year 753 B.C. from which later generations of Romans had reckoned their era *post urbem conditam*; and the year 776 B.C., which figured as the first year of 'the First Olympiad' quadriennium, was admittedly not the ascertained first year in which the Olympian Festival had been celebrated, but merely the first year in which there was a record of the name of a victor in the games at the chronometrist's disposal for use as an eponym. In the third place there were cases in which eras had been reckoned from an imaginary event in the cosmogonical scheme of some particular school of theology: for example, the supposed instantaneous creation of the World by the fiat of a unique and omnipotent personal God, which had been discrepantly dated the 7th October, 3761 B.C., by the Jews, the 1st September, 5509 B.C., by the Eastern Orthodox Christians,⁴ and

¹ 'New eras' have already been discussed, as symptoms of 'Futurism', in V. vi. 339-45.

² This is the proper correction for the popular traditional date 16th July, 622. D. S. Margoliouth dates the *Hijrah* the 20th September, 622 (*Mohammed and the Rise of Islam* (3rd ed.: London 1905, Putnam), p. xx).

³ The traditional Christian Era is said to have been instituted in A.D. 525 at Rome, by the Abbot Dionysius Exiguus, at the instance of the Pope. Even within the limits of Western Christendom it did not become generally prevalent till the ninth century.

⁴ The Eastern Orthodox Christian reckoning by 'Years of the World' appears to have

6.0 p.m. on the evening before the 23rd October, 4004 B.C., Old Style, by the Anglo-Irish chronologist-archbishop Ussher (*vivebat* A.D. 1581-1656).¹

The Inability of New Eras to establish themselves without Religious Sanctions

In the two preceding paragraphs the eras passed in review have been marshalled in a descending order of the cogency of the evidence for the events chosen by their originators for setting their initial dates; but, if we now resurvey these same eras from the standpoint of their relative success or failure in gaining a wide and lasting currency, we shall observe that the talisman by which their destinies had been decided had not been the touchstone of historical attestation, but the presence or absence of a religious sanction. In A.D. 1952 the historically dubious Western Christian Era was in the ascendant in the World on the unexpended strength of its ancient appeal to the former religious sentiment of its once Christian Western disseminators. The Islamic Era of the Hijrah, which was now on the defensive against the Christian Era, was still holding its own, in so far as it was succeeding in doing so, in virtue of its living appeal to the surviving religious sentiment of a majority of its hereditary adherents, and not at all in virtue of its being, as it was, as impeccable historically as the Christian Era was vulnerable to assaults of the higher criticism. At the same date the Jews were still persistently reckoning by their hallowed version of the date of the Creation. The vitality that was thus being displayed by the religious eras in A.D. 1952 was thrown into sharp relief by its contrast with the mortality rate of these consecrated eras' unhallowed secular counterparts. The Era of the First French Republic had been discarded by Revolutionary France herself in its fourteenth year on the 1st January, 1806; the Era of the Italian Fascist Revolution had shared the downfall of Fascism itself; and even the Seleucid and Gupta eras, after remaining in use for centuries, and being adopted or imitated by successive epigoni and supplanters of their originators, had long since fallen out of use.²

It is also significant that other secular events which, in the minds of contemporaries and Posterity, were no less epoch-making than those cited above, were never taken as the starting-points of new eras—not even of new eras that were abortive. Cases in point are the beginning, in May 1703, of the building, at St. Petersburg, of a new capital for Russia that was to be Western from the start;³ the landfall of the Pilgrim Fathers in New England on the 21st December, 1620; the

arisen at Constantinople in the seventh century of the Christian Era. In Russia, it was abrogated by Peter the Great, in favour of the Western Christian reckoning by 'Years of Our Lord', as from the 1st January, 1700. The celebration of New Year's Day thenceforward on the 1st January, in lieu of the 1st September, was made obligatory (see Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 227).

¹ See XI. ix. 178. Bishop Ussher's chronology found its way into the margin of the Church of England's Authorized Version of the Bible.

² 'The tenacity of the Seleucid calendar was remarkable: Doura used it when under Roman rule and Jews down to the eleventh century, and it is said to have still been in use among Syrian Christians at the beginning of the present century' (Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 65).

³ See p. 221, above.

opening of a new chapter in Western history towards the close of the fifteenth century of the Christian Era (an event which could have been dramatically symbolized either in the crossing of the Alps by King Charles VIII of France in A.D. 1494, or in da Gama's landfall at Calicut on the 20th May, 1498, or in Columbus's landfall on one of the Antilles on the 12th October, 1492, or in the publication of the first Western printed book in A.D. 1445-6). We might add to this catalogue the beginning, in the year A.D. 324, of the building, at Constantinople, of a new capital for the Roman Empire that was to be Christian from the start,¹ and the crossing of the Hellespont by Alexander the Great in 334 B.C.

Evidently the recognition of the authenticity and the importance of an event is not enough, in itself, to make such an event eligible for serving as a mark for the measurement of Time. If the historic event is not consecrated by some religious sanction, its intrinsic merits as a starting-point for an era may count in practice for little or nothing. There is indeed a traditional association, which cannot be dissolved with impunity, between the measurement of Time by human intellects and the hold of Religion over human souls, and the ground for this is not difficult to descry. Religion dominates every side of life or aspect of the Universe that is recognized by Man as being out of his control, and in this respect there is a striking contrast between Man's relation to the heavenly bodies whose cyclic movements give him his measures of Time and the divers objects which he subjects to measurements of length, volume, weight, and value. Man has at least an illusion of being master of the flour that he metes out in a man-made vessel after having ground it from grain produced by a harvest that Man himself has sown and reaped; he has a still greater sense of mastery over the piece of metal that he strikes into a coin after having smelted it from ore that he has detected in, and extracted from, the bowels of the Earth; but the stars in their courses overawe him by their inexorable aloofness, though in truth the astronomer's intellectual mastery over them is a more wonderful achievement than any physical feats of miner, miller, husbandman, or metallurgist.

In caeloque deum sedes et templa locarunt,
per caelum volvi quia nox et luna videtur—
luna, dies et nox et noctis signa severa,
noctivagaeque faces caeli flammaeque volantes . . .
nam cum suspicimus magni caelestia mundi
templa super stellisque micantibus aethera fixum,
et venit in mentem solis lunaeque viarum,
tunc aliis oppressa malis in pectora cura
illa quoque expergefatum caput erigere infit,
nequae forte deum nobis immensa potestas
sit, vario motu quae candida sidera verset.²

So far from readily falling into the delusion that he can affect the move-

¹ See pp. 218 and 238, above. The dedication date of the completed city was the 11th May, 330.

² Lucretius: *De Rerum Natura*, Book V, ll. 1188-91 and 1204-10.

ments of the heavenly bodies, Man has found it difficult to shake off the contrary delusion that these movements influence human destinies.

The persistence of this superstition in the inaccessible subconscious depths of the Psyche, even in societies that had attained a degree of sophistication at which Astrology had been professedly discredited and repudiated, was attested by the rarity of the instances in which a revolutionarily rational reform of the Calendar had succeeded in establishing itself. The French Revolution, whose rationalized codes of law went forth, conquering and to conquer, to the ends of the Earth¹ and whose pedantically new-fangled weights and measures—grammes and kilogrammes and milligrammes, metres and kilometres and millimetres—enjoyed a *succès fou* and ran like wildfire round the globe, was utterly defeated in its attempt to supersede a pagan Roman calendar that had been rejuvenated through being consecrated by the Christian Church, though the substitute which the lucid French Reason offered was the attractive one of a neatly proportioned new series of picturesquely renamed months—a Brumaire, a Ventôse, a Germinal, a Fructidor—each cut to a uniform length of thirty days grouped in three ten-day weeks. The batch of five supernumerary days that made up the tale of the ordinary (non-leap) year ‘hardly marred the most sensible calendar ever invented—too sensible for a country which calls the tenth, eleventh and twelfth months of the year October, November and December’.² Yet, while the fantastically erroneous lunar year of an archaic Meccan oasis-state had been adopted, as the calendar of Islam, by hundreds of millions of people over a vast area extending almost from end to end of the Old World, the ‘sensible’ calendar devised by French votaries of Reason did not manage to outlive its fourteenth year, and the shortness of its life testified that, after all, the French revolutionaries had been less wise in their generation than the Roman conservatives.

The Roman misnomers pointed out by a distinguished Modern Western historian in the passage quoted just above were neither casual nor imbecile but deliberate and sagacious. The six months originally denoted in the Roman calendar by numerals, and not by the names of gods, had not, of course, been wrongly numbered when their names had first been bestowed on them. Originally the Roman official year had begun on the 1st March, in the spring of the solar year, and this month had been a convenient starting-point for the annual round of administration and warfare, as well as agriculture, so long as the Roman Government’s range of action had extended no farther afield than a few days’ march from the Pomoerium; for, under those conditions, an annual magistrate elect who had entered on his term of office on the 15th March could still take up the local command, assigned to him by the Senate, in time to take advantage of the spring campaigning season. When, however, in and after the Hannibalic War, the field of Roman military operations expanded out of Italy overseas into the Balkan Peninsula and the still more distant Iberian Peninsula, a magistrate,

¹ See pp. 271–8, above.

² Thompson, J. M.: *The French Revolution* (Oxford 1943, Blackwell), p. ix.

appointed to one of these distant commands, who had to wait till the 15th March before setting out from Rome might find himself unable to get into action before the summer was at its height and the autumn was approaching.

During the half-century immediately following the end of the Hannibalic War, this hampering loss of the best part of each annual campaigning season, with which the Roman state was threatened now that it had come to be fighting its wars in theatres at a distance of as much as several months' journey from the Italian homes of a Roman peasant soldiery, was at first largely offset by a discrepancy between the Roman official calendar and the actual cycle of the seasons resulting from the Pontifical College's cumulative neglect to keep the official year in step with the solar year by inserting intercalary months of the requisite length at the requisite intervals. For example, in the year 190 B.C., in which a Roman army inflicted a decisive defeat upon a Seleucid army on the Asiatic battlefield of Magnesia, the legions found time to arrive on the threshold of Sardis before the current season was over, because in that year the official 15th March fell on a day that was in reality the 16th November of the preceding solar year, while in the year 168 B.C., in which another Roman army inflicted an equally decisive defeat on a Macedonian army at Pydna, the official 15th March fell on a day that was in reality the 31st December of the solar year 169 B.C.¹ In these two militarily critical years the campaigning season was thus salvaged for Roman military operations thanks to a calendrical error; but, whether this error had been dictated by military considerations or by superstition, its efficacy diminished as the Roman calendar was progressively brought back nearer to correspondence with the solar year. The additional time now needed for arriving at a theatre of war before the campaigning season would be too far advanced had therefore to be provided by some alternative means; and, with this eminently practical consideration in mind, the Roman Government secured the passage of a law providing that, as from the year 153 B.C. onwards, the date on which the annually elected magistrates were to enter on their term of office was to be advanced, by two and a half months, from the 15th March to the 1st January,² and in consequence January instead of March became the first month of the year.³

Finding themselves thus constrained by *raison d'état* to call upon their

¹ In these two cases the magnitude of the Roman calendar's deviation from the current solar year can be calculated because Livy has recorded the dates of eclipses in terms of the day of the official Roman month (see Bouché-Leclercq, A.: *Histoire des Séleucides* (Paris 1913-14, Leroux, 2 vols.), vol. i, p. 205).

² The original provision in the United States for a four months' interval between the election of a President's electors and the President Elect's assumption of office was made with the similar practical purpose of ensuring that he should have sufficient time to convey himself to Washington by horse-traction from his home state, even if this happened to be Georgia or New Hampshire. Within half a century of the year in which the Constitution had been adopted, the invention of steam-traction by railroad had stultified the practical purpose which this provision had originally been designed to serve, but it was not till the 6th February, 1933, that the interval was shortened by 36 days through the coming into force of the Twentieth Amendment to the Constitution (see XII. ix. 496).

³ The definitive replacement of the 1st March by the 1st January as the Roman New Year's Day seems to have taken place on the 1st January 45 B.C. as part of Julius Caesar's reform of the Roman Calendar.

public to put up with one shock to its habits and prejudices, the Roman authorities forbore to aggravate an already somewhat vexatious demand upon the Roman People's capacity for adaptation by simultaneously asking them to alter the traditional names of six of their twelve months merely out of respect for a different kind of reason which would have been, not political, but sheerly pedantic. Satisfied with their success in meeting the bare practical need of the day, the Conscrip't Fathers let the names of the months alone, and more than a century was allowed to pass before two out of the six resultant misnomers were corrected. At length the architects of the Principate took the bold step of renaming the first two of those six months which a Roman poverty of imagination had hitherto left unanimated and unhallowed by the names of gods. The month that was now the seventh, though still called 'the fifth' (*Quinctilis*), was renamed after Divus Iulius, and the following month (previously *Sextilis*) after Divus Augustus. The audacious innovation caught on, and in A.D. 1952 the calendars of both the Orthodox Christian and the Western World were still bearing the superscription of those two Roman statesmen in the month-names 'July' and 'August'.

Such currency is indeed apotheosis, if not immortalization; yet, in thus achieving a nomenclatory *tour de force* that proved beyond the capacity of French revolutionary enthusiasts, the astute authors of the Julian Calendar were exceptionally successful. In the United Kingdom in the supposedly enlightened eighteenth century of the Christian Era, disturbances were caused by an Act of Parliament, passed in A.D. 1751, for replacing the inexact Julian by the virtually perfect Gregorian calendar. This amended calendar had first been introduced by Pope Gregory XIII as far back as A.D. 1582, and in the meantime it had been adopted in most of the leading states of the Western World. But, in the sacrosanct sphere of the Calendar, religious susceptibilities long inhibited English Protestants from embracing a Papistical innovation, even if it were astronomically correct; and, sure enough, when the Act was published, it became suspect of having a catch in it. By the year 1752, in order to bring the current Julian reckoning into line with the Gregorian reckoning when this was substituted for it, it was necessary to drop eleven days out of the calendar year in which the change was being inaugurated. In their superstitious fear of calendrical magic, the British public were impervious to the simple truth that the eleven days which were to be dropped were only theoretical days on paper; they jumped to the conclusion that they were being cheated of eleven days' pay,¹ or perhaps even being docked of eleven days of life, and vociferous crowds went about demanding to have their stolen eleven days given back to them.

The Conservation of Pagan Calendars by Churches

Who had been the beneficiaries of calendars inherited by universal states from a dim religious past and rationalized by them at their peril?

¹ In fact, of course, everyone who was paid by the year or the month stood to gain, while anyone who was paid by the week or the day did not stand to lose, by the omission of eleven days in the month of September, 1752.

The marvellously exact, though formidably complex, Mayan calendar was bequeathed by 'the Old Empire' of the Mayas to the Yucatec and Mexic societies that were affiliated to the Mayan Civilization. The Sinic calendar was similarly bequeathed by the Empire of Ts'in and Han to the Far Eastern society affiliated to the Sinic Civilization. The Sumerian calendar, after having been bequeathed by 'the Realm of the Four Quarters' to the Babylonian Society affiliated to the Sumerian Civilization, and having survived to serve the Neo-Babylonian and Achaemenian Empires in their turn,¹ acquired at this stage a new lease of life through being adopted by the Jewish Church that was the enduring monument of Judah's fifty-years' exile by the waters of Babylon. The Roman calendar was bequeathed by the Roman Empire to the Christian Church and was transmitted² by this original legatee to secondary recipients—in the first place to the Orthodox Christian and Western societies, and thereby eventually to a number of universal states founded by Orthodox Christian and Western empire-builders: e.g. the Muscovite Empire in the Russian offshoot of Orthodox Christendom; the Danubian Hapsburg Monarchy; the Spanish Empire of the Indies; the British Rāj in India. By a still stranger caprice of Fortune the archaic lunar calendar of Mecca, thanks to its adoption by Islam and by the Caliphate, became the calendar of the Iranic and Arabic Muslim societies and hence the calendar of the Ottoman Empire and of the Timurid Mughal Empire on Indian ground.

This brief survey shows that in the histories of calendars the function most frequently performed by a universal state had been to take over a calendar from a primitive pagan past and to transmit it to a higher religion. In the process of transmission the universal state had sometimes stamped the pagan calendar with its own political imprint; yet, when once a calendar had been adopted from a universal state by a 'higher religion', it was apt, notwithstanding the patent evidence of its unhallowed origin, to acquire the sacrosanctity with which the higher religions had been tempted to invest their casually acquired external accessories as well as their inner spiritual essence; and a calendar that had received this consecration had to be taken as it had been found by civilizations and universal states of a later generation who had inherited it from some higher religion that had incubated them. The accoutrements of a church usually cannot be refurbished by any party except the Church's own recognized supreme authority, whatever that authority may be. In Northumbria in the seventh century of the Christian Era the abandonment of a traditional method of reckoning the date of Easter, which had survived in a Far Western Christendom, in favour of a

¹ In the Jewish garrison-community at Elephantine under the Achaemenian régime, the Babylonian calendar was current officially and the Egyptian unofficially (Meyer, E.: 'Zur Chronologie der Papyri von Elephantine', in *Kön. Preuss. Ak. Wiss., Gesamtsitzung* vom 23 November, 1911: *Mitt.* vom 26 October, pp. 1040-1).

² With the important addition of a reckoning by Jewish weeks as well as by Roman months. The Jewish community's original count of weeks—from the forgotten initial date at which this had been started—was still being kept, in A.D. 1952, in all living communities with a Jewish, Christian, or Muslim background. This was an historically notable common practice of the three religions—though Christianity and Islam had taken care to differentiate their practice from the Jews' and from one another's by choosing a different day of the week for their own equivalent of the Jewish Sabbath.

novel method which was a Roman innovation, implied a recognition of the Roman Church's supremacy over the churches of 'the Celtic Fringe'.¹ In a Western Catholic Christendom in the sixteenth century of the Christian Era the Julian Calendar—work of pagan genius though it was—could not have been reformed by any other authority than the Papacy; and the act of Pope Gregory XIII was as effective as it was uncharacteristic of the normally conservative *éthos* of an established universal church.

The Defeat of a Duodecimal by a Decimal System of Reckoning

When we pass from calendars and eras to weights and measures and money, we enter a province of the field of social currencies in which the rationalizing intellect holds sway uncensored by those religious scruples that had sometimes welled up forcefully from the subconscious depths of the Psyche when Reason had sought to extend her rule over the reckoning of Time.

The French Revolutionaries, who suffered such a shattering defeat in their attempt to inaugurate a rational new calendar and new era unfortified by an augur's indispensable religious prestige, scored with their new weights and measures an oecumenical success that eclipsed even the triumph of the Napoleonic Codes. And a kindred spirit, Ts'in She Hwang-ti, the revolutionary founder of a Sinic universal state, succeeded in imposing the current weights and measures of his own hereditary parochial state of Ts'in upon the conquered remainder of the Sinic World² without, apparently, provoking in this case the stultifying reaction by which, in other fields, his work, like that of his French *confrères*, was so largely undone within a few years of its recklessly sweeping execution.

Though it is evident that weights and measures are a sphere in which the revolutionary intellect can disport itself with an unusual impunity, a comparison of the respective fortunes of the French and the Sumeric new model metric system suggests that the dazzling success of the French reformers' work was due, above all, to their judicious moderation in setting common-sense bounds to their pursuit of their ideal. They were uncompromising in reducing the bewilderingly variegated tables of the *Ancien Régime* to one single system of reckoning; but they showed their practical good sense in irrationally following for this purpose the inconvenient decimal system which had been unanimously adopted by all branches of the Human Race, neither on its merits nor as the result of some laboriously achieved diplomatic compromise between conflicting better plans, but simply because the normal human being was born with ten fingers and ten toes.

It was one of Nature's unkind practical jokes that she had furnished some of the tribes of her vertebrate brute creation with six digits apiece for each of their four limbs without endowing the possessors of this

¹ See II. ii. 326, 332, and 335.

admirable natural abacus with the intellectual capacity for mathematical calculation, while she had dealt out to the *Genus Homo* a niggardly allowance of appendages that added up, not to dozens and double dozens, but only to decades and scores. Given the human anatomy, a decimal notation of Man's mathematical affairs was as inevitable as it was unfortunate. It was unfortunate because, on a decimal count, the basic scale of reckoning is divisible only by the low-powered number Two and the not very useful number Five, while the lowest number divisible alike by all the three key-factors Two, Three, and Four is Twelve. The decimal notation was nevertheless inevitable because, by the time when any wits in any society had come to appreciate the intrinsic superiority of the number Twelve over the number Ten, the decimal notation had become ineradicably entrenched in practical life, in language, and perhaps even already in written records.

The reformers of the French weights and measures forbore to kick against these ten-pronged pricks, but they had Sumerian predecessors who had been less wise in their generation. The Sumerian discovery of the virtues of the number Twelve was a stroke of pure intellectual genius, for there were no obvious sets of twelve articulations on the surface of the human body to guide a pioneer mathematician to the ideal choice for a scale of reckoning. The Sumerians not only saw the advantages of the number Twelve; they took the revolutionary step of recasting their system of weights and measures on a duodecimal basis; but apparently they did not realize that, unless they could also achieve the further, and far more difficult, step of leading their fellow men to substitute a duodecimal for a decimal basis of reckoning for all purposes,¹ the convenience of acquiring, for the simple purpose of weighing and measuring, a basic scale divisible by both the numbers Three and Four would be far more than offset by the inconvenience of having two incommensurable scales in operation side by side. This hopeless irreconcilability of an ideally convenient Twelve with a practically ineradicable Ten foredoomed an intrinsically superior duodecimal system of weights and measures to ultimate defeat, and assured a whole-hogging decimal system of a rapid victory. In the course of the four thousand years preceding the inauguration of the French decimal metric system the Sumeric duodecimal metric system had spread, notwithstanding its inherent handicap, to the ends of the Earth. Yet this long start in Time and Space did not save it from being almost entirely supplanted by its latter-day decimal competitor within 150 years of this rival system's promulgation. By A.D. 1952 the twelve ounces constituting a troy-weight pound and the twelve pence constituting a shilling in the antediluvian

¹ Technically the step would be simple enough in a society employing the originally Hindu 'Arabic' numerals or any other application of the device of making the numerical value of a figure depend on its relative location in a group. All that would be needed would be the invention of two new figures to represent the numbers Ten and Eleven. The notations 10 and 11 would then be released to stand respectively for Twelve and Thirteen. Twelve would be represented by 10, Twenty-four by 20, One Hundred and Forty-four by 100, and so on. The difficulty would lie, of course, not in cyphering, but in thinking, duodecimally; for in the common cultural tradition of the Human Race the decimal count was so immemorably old a piece of mental furniture that it had come to be virtually a fixture.

metronomy of the United Kingdom were almost the last surviving monuments of an unpractical stroke of Sumerian genius; and in an obstinately decimal-minded world it could not be maintained that this piously conservative loyalty to a provedly unsuccessful intellectual experiment was anything but a hindrance to the dispatch of business.

The Invention of Coinage

As soon as it has come to be recognized and accepted that honest dealing in weights and measures is a matter of social concern transcending the personal interests of the parties directly involved, and that therefore any government that aspires to be worthy of the name must make the giving of false weight and measure a prosecutable and punishable offence at law, the invention of money lies just round the corner. Yet this corner can only be turned by the taking of certain precise successive steps, and the requisite combination of moves in fact remained unachieved in the history of any society in process of civilization before the seventh century B.C., though by that time the species of societies called civilizations had already been in existence for perhaps as long as three thousand years.

The first step was the invention of the commercially useful expedient of giving some particular commodity or commodities the special function and status of serving as media of exchange and thereby acquiring a secondary use independent of their intrinsic utility. But this step did not, in itself, lead on to the invention of money when the commodities selected as media of exchange were multifarious and not exclusively metallic. In the Mexic and Andean worlds, for example, by the time of the Spanish conquest, the substances known and coveted in the Old World as 'the precious metals' existed in quantities that seemed fabulous to the Spanish *conquistadores*, and the natives had long since learnt the art of extracting, refining, and working this local gold and silver; but, though they valued it as material for works of art and ornaments, they had not thought of turning it to account as an exclusive medium of exchange,¹ though they, too, had hit upon this secondary use of com-

¹ Chronological facts forbid the otherwise almost irresistible conjecture that some report of this Mexic and Andean practice (so strange to the ears of denizens of the Old World) of estimating gold and silver, like any other commodity, at a valuation based on their mere intrinsic utility inspired a famous passage of More's *Utopia*:

'They keep an inestimable treasure, but yet not as a treasure. . . . Gold and silver . . . they do so use as none of them doth more esteem it than the very nature of the thing deserveth. And then who doth not plainly see how far it is under iron—as without the which, men can no better live than without fire and water, whereas to gold and silver Nature hath given no use that we may not well lack, if that the folly of men had not set it in higher estimation for the rareness' sake. . . . Whereas they eat and drink in earthen and glass vessels, which indeed be curiously and properly made, and yet be of very small value, of gold and silver they make commonly chamber-pots and other vessels that serve for most vile uses. . . . Furthermore, of the same metals they make great chains, fetters and gyves, wherein they tie their bondmen. . . . Thus by all means possible they procure to have gold and silver among them in reproach and infamy' (More, Sir Thomas: *Utopia*, English version, Book II: 'Of their Journeying or Travelling Abroad').

Utopia, however, was published before the end of A.D. 1516, and 'it is important to remember that the Inca Empire of Peru, which in more than one detail had a likeness to Utopia, was not known till some fourteen years later; Cortés had not yet conquered Mexico' (Chambers, R. W.: *Thomas More* (London 1935, Cape), p. 143). Evidently these dates rule out the possibility that the passage in *Utopia*, quoted above, could have been inspired by reports of Central American or Andean institutions. It may, however,

modities independently of the Old World and perhaps also independently of one another.

In the Mexic World the Spaniards found cacao beans, cotton cloths, T-shaped pieces of copper, and quills stuffed with gold dust circulating as media of exchange;¹ in the Andean World they found pimento, dried fish, cotton, maize, chuño, birds' feathers, salt, coca, and copper being used for the same purpose.² There was also at least one instance in which they found sea-shells being employed in this way, as the cowrie shell likewise was employed round the shores of the Indian Ocean.³ It will be seen that the civilizations of the New World came near to employing standard units of metal in the fashion which, in the Old World, had led to the invention of money more than two thousand years earlier, while the employment of shells—a commodity without any intrinsic value of its own—was an anticipation of that use of paper money which in the Old World had already arisen, before the Spaniards' conquest of the Americas, as a sequel to the use of metallic coin.⁴ Yet, though the civilizations of the New World thus came within an ace of inventing money, they failed to take the final step, and the verdict of History on their achievements in this sphere is that 'a miss is as good as a mile'.

In the commercially interwoven Egyptian, Babylonian, Syriac, and Hellenic worlds by the date of the invention of money in the Hellenic World in the seventh century B.C.,

'the use of the precious metals in bar form as measures of value had been a regular institution for thousands of years past. They circulated, not in the form of coin minted by a state and guaranteed as legal tender, but as units of weight which passed from hand to hand in established forms such as rings, plaques, ornaments and so on, but which, in the act of payment, had to be verified by being weighed like any other commodity.'⁵

This usage had perhaps become customary in the Sumerian World in the time of its universal state;⁶ but a regular metallic medium of exchange was the raw material of money without being the thing itself.

have been inspired by reports of already discovered fringes of the Americas where 'the precious metals' were given the same valuation by the inhabitants as in Mexico and Peru—whether in consequence of the radiation of one or other or both of these indigenous civilizations of the New World, or because even the more backward among the 'native' peoples had arrived independently, by the light of Nature, at the same common-sense valuation of gold and silver as their more progressive neighbours. 'We can only understand *Utopia* if we remember the Europe for which it was written; . . . the travels of Vespucci in every man's hands: Vespucci, who had found folk holding property in common and not esteeming gold, pearls or jewels' (ibid.).

Though the historic institutions of the Incaic Empire did not inspire *Utopia*, the imaginary institutions of More's ideal society did inspire one of the more beneficent and successful attempts, on the part of the Spanish conquerors of the New World, to fill the social vacuum which they themselves had produced by brutally shattering the fabric of Central American and Andean society. The Spanish philanthropist Vasco de Quiroga, who arrived in the Indies in A.D. 1530 as an enthusiastic disciple of More, succeeded in founding Indian *pueblos* on lines that were a deliberate attempt to reproduce *Utopia* in real life (Haring, C.: *The Spanish Empire in America* (New York 1947, Oxford University Press), p. 193). The present writer visited some of these on the 23rd–26th April, 1953.

The decisive steps which conjured money into existence were taken in the seventh century B.C. by some Greek city-state, or perhaps by several of the commercially foremost Greek city-states of the day simultaneously, when their governments went beyond the existing practice of putting metallic media of exchange on a par with other commodities and thereby including them under the common ruling that made it an offence at law to give false weight and measure in the transfer of any commodity from hand to hand. These pioneer city-states now took the two revolutionary steps of making the issue of these metallic units of value a government monopoly and of stamping this exclusive governmental currency with a distinctive official image and superscription as a guarantee that the coin was an authentic product of the governmental mint and that its weight and quality were to be accepted as being what they purported to be on the face of them. When a government had assumed this prerogative, the clipping or filing of authentic coins became a political crime against the state and not merely an offence in civil law against some private individual on whom the fraudulently reduced lump of metal had been palmed off, and counterfeit coining by private individuals became a crime of the same order—a crime which would be not a whit less heinous if the unauthorized coiner's politically bad money happened to be as good in weight and quality as the legitimate coinage of the realm.¹

The Diffusion of the Use of Coinage

Since the management of a coinage is evidently least difficult in a state with a minimum area and population, it was perhaps no accident that city-states should have been the political laboratories in which the invention was made. At the same time it is equally evident that the utility of a coinage increases with every enlargement of the area and population in which it circulates as legal tender. Such Greek city-states as Phocaea, Lampsacus, Miletus, Aegina, and Corinth, which were pioneers in minting coin, were of miniature material dimensions; and the narrow range of currency of these city-state issues was not appreciably extended when, as happened in several notable instances, two or three city-states situated in different quarters of the Hellenic World—one, perhaps, in Ionia or on the Hellespont, a second in Continental European Greece, and a third in Sicily or Magna Graecia—went into commercial partnership and arranged to issue uniform coinages which could all circulate *de facto*, if not *de jure*, throughout the issuing governments' combined domains. In the wide world beyond, where the writ of these petty governments did not run, their minted coinage was not accepted at its face value but was still treated like any unminted standard unit of metal whose value had to be assayed by weighing, every time the piece changed hands.²

¹ It will be seen that the invention of coinage is analogous, in the field of commerce, to the epoch-making change that takes place in the field of criminal law when a government takes to treating crimes as political offences against itself instead of regarding them merely as personal injuries to be avenged by the private self-help of the victim or his surviving kinsmen, in regard to which the government's own responsibility, at its widest, is limited to promulgating a tariff of *vergelde*s.

² In out-of-the-way places with no coinage of their own, this practice of treating

A regional jump in scale was achieved when, in the earlier decades of the sixth century B.C., the Lydian Monarchy conquered all the Greek city-states round the western coasts of Anatolia except Miletus, as well as the interior of the peninsula as far east as the River Halys, and issued a coinage of electron (gold alloyed with silver), based on the local standard of the subjected Greek city-state of Phocaea, which was given a general currency throughout the Lydian dominions. The last and decisive step was taken when the Kingdom of Lydia, with its subject Greek city-states, was incorporated, in its turn, into the Achaemenian Empire. The Achaemenidae had the imagination to perceive the value, for a universal state, of this new invention which they had stumbled upon on the far western fringe of their South-West Asian World. They issued a gold coinage superior to the Lydian both in weight and in purity of metal, with a subsidiary silver coinage to supplement it, and they made the coining of gold an imperial monopoly. At the same time, with characteristic liberality, they permitted autonomous Greek and Phoenician city-states, client principalities, and even the Persian viceroys of imperial provinces, to issue, on their own account, not only small change in copper, but also silver money to circulate side by side with the silver issues of the imperial mints.¹

In a more jealous vein the Roman Imperial Government in its day monopolized, throughout its dominions, the coining of silver as well as gold, and left nothing but copper cash to be issued by autonomous and allied states members of the Roman Commonwealth.² The prerogative, asserted by the Roman Imperial Government, of monopolizing the coining of gold was tacitly respected by the Arsacid Government, in spite of an insistence on their political independence which they vindicated successfully by force of arms on several critical occasions; and, when the easy-going Arsacidae were supplanted by militant Sasanidae who asserted, not merely their independence of Rome, but a political parity with her, these self-conscious successors of the Achaemenids in the Cis-Euphratean portion of the former Achaemenian dominions found themselves debarred by economic inability from emulating their Achaemenian ensamples and flouting their Roman contemporaries by taking to coining in gold as well as in silver.

After the Primitive Muslim Arabs had achieved the unfulfilled ambitions of the Sasanidae by reuniting under a single oecumenical régime, for the first time since the death of Alexander the Great, the bulk of the

foreign coins as if they were pieces of uncoined metal lasted for at least twelve hundred years after the invention of coinage on the shores of the Aegean. For example, 'at Mecca in Muhammad's day Roman gold pieces and Persian dirhems were already in circulation, but in commercial transactions they were valued by their weight' (Kremer, A. von: *Culturgeschichte des Orients* (Vienna 1875-7, Braumüller, 2 vols.), vol. i, p. 169).

¹ See Meyer, E.: *Geschichte des Altertums*, vol. iii, 1st ed. (Stuttgart 1901, Cotta), pp. 80-82. A viceroy who presumed to issue a silver coinage with as low a content of alloy as the alloy content of his Achaemenian imperial master's gold coinage was, however, found guilty of high treason by Darius *ipso facto*, according to Herodotus, Book IV, chap. 166.

² A provincial silver coinage was issued at Alexandria, and for a time at Antioch as well, by local branches of the Imperial Mint; on the other hand, in the western provinces even the copper cash in circulation was mostly of Roman and not of local mintage (see Rostovtzeff, M.: *The Social and Economic History of the Roman Empire* (Oxford 1926, Clarendon Press), p. 171).

former Achaemenian dominions, including the latterly Roman provinces in Syria and Egypt as well as the entire domain of the Sasanian Empire,¹ successive attempts were made by the Umayyad Caliphs Mu'āwiyah I (*imperabat* A.D. 661–80) and 'Abd-al-Malik (*imperabat* A.D. 685–705) to restore the long-lost monetary unity of the Syriac World.² There are indications,³ however, that, in the matter of coinage, weights, and measures, the Caliphate did not in practice succeed in re-establishing a unity which was so triumphantly re-established under its aegis on the social, cultural, and spiritual planes.

The Invention of Paper Money

The oecumenical Achaemenian gold coinage had given the then still recent invention of money an impetus that had sped it—as the Revolutionary French decimal metric system and the Napoleonic Codes were to be sped in a later age—on an irresistible and almost ubiquitous course of conquest. Coined money was launched on its historic career in India by the temporary annexation of the Panjab to the Achaemenian Empire itself.⁴ The more distant Sinic World became ripe for adopting the new institution after Ts'in She Hwang-ti's revolutionary empire-building work had been salvaged through being tempered by the tactful hands of Han Liu Pang. In its first fumbings with this puzzling alien device, the Prior Han régime betrayed its failure to apprehend one of the essential principles involved when in 175 B.C. the Emperor Hsiao Wên (*imperabat* 180–157 B.C.) sought to make up a shortage of currency by abandoning the imperial monopoly of issue and giving licences to local governors and princes of the Imperial House to mint copper cash.⁵ The consequent inflation was eventually cured in 113 B.C. by the drastic steps of demonetizing all current coins and issuing a new imperial currency minted exclusively at Ch'ang Ngan under the direct control of imperial officials,

¹ See I. i. 76–77.

² See Wellhausen, J.: *Das Arabische Reich und Sein Sturz* (Berlin 1902, Reimer), pp. 135–6. According to Ahmad Al-Balādhurī: *Kitāb Futūh-al-Buldān* (English translation by Hitti, P. K., and Murgotten, F. C. (New York: Columbia University Press), vol. i (1916), pp. 383–4, and part ii (1924), pp. 263–6, 'Abd-al-Malik started coining gold (in ex-Roman territory) at Kūfah at the end of A.H. 74, and his eastern viceroy Al-Hajjāj silver (in ex-Sasanian territory) at Kūfah at the end of A.H. 75. The same authority reports that the occasion was a quarrel between the Umayyad and Roman Governments over a delicate question of images and superscriptions. According to Al-Balādhurī, the Caliphate had been selling to the Roman Empire Egyptian papyrus (which the Romans could not do without) in exchange for Roman gold coin (for circulation in the ex-Roman part of the Umayyad dominions). The water-mark on the papyrus (which was processed in Egypt before export) had been provocatively changed by 'Abd-al-Malik from the sign of the Cross to the Qur'anic text 'Say: He alone is God'. The Romans had threatened to retaliate by inscribing their—as they believed, indispensable—gold pieces with strictures on the Prophet Muhammad. This threat moved the Caliph 'Abd-al-Malik to start coining gold for himself. According to the East Roman chronicler Theophanes, *sub* A.M. 6183 (*Theophanis Chronographia*, ed. C. de Boor, vol. i (Leipzig 1883, Teubner), p. 365), the Roman Imperial Government refused to accept these new Damascene gold pieces in payment of the tribute which had been one of the stipulations in the treaty of A.D. 688 prolonging the peace settlement of A.D. 685, and this was the occasion of the recrudescence of war between the Umayyad Power and the Roman Empire in A.D. 692 (see Bury, J. B.: *A History of the Later Roman Empire* (London 1889, Macmillan, 2 vols.), vol. ii, p. 322; von Kremer, *op. cit.*, vol. i, pp. 168–70.

while at the same time granting an amnesty to the host of convicted coiners¹ who had continued to mint cash without licence in defiance of the Imperial Government's reassumption of its monopoly. But in 119 B.C., in the reign of the Emperor Wuti, in the course of preliminary gropings after some less arduous method of reconstituting a sound currency, the Imperial Government redeemed its compromised reputation for financial acumen by a quaint expedient based on a brilliant intuition of the hitherto undiscovered truth that metal is not the only stuff of which good money can be made.

'In the imperial park at Ch'ang Ngan the Emperor had a white stag, a very rare beast, which had no fellow in the empire. On the advice of a minister the Emperor had this animal killed, and made a kind of treasury note out of its skin, which, he believed, could not be copied. These pieces of skin were a foot square, and were made with a fringed border and decorated with a pattern. Each piece was assigned the arbitrary value of 400,000 copper coins.² The princes, when they came to pay their respects to the Throne, were compelled to buy one of these pieces of skin for cash, and present their gifts to the Emperor upon it. This precaution ensured the circulation of "the White Stag Notes". The skin of the white stag was, however, a limited quantity, and the time soon came when this device ceased to supply the Treasury with much needed money.'³

Leathern money—in this case apparently made from sable pelts—turns up again in Russia in the thirteenth century of the Christian Era, at a time when she was politically associated with China under a common Mongol domination,⁴ but the invention of currency notes did not become effectively applicable till it had become associated with the two subsequent inventions of paper (invented in the penultimate chapter of Sinic history under the Posterior Han Dynasty)⁵ and printing (invented in the early summer of the affiliated Far Eastern Society under the T'ang Dynasty).⁶

Negotiable paper ('flying money'), in the form of cheques tallying with stubs retained by the Imperial Treasury at Si Ngan, was issued by the T'ang Government in the years A.D. 807 and A.D. 809;⁷ but there is no evidence that the inscriptions on these cheques were printed. Paper money on which there was probably an imprint was issued in the Chinese province of Szechwan—first by a group of private men of business, and later by the local government through the agency of a bank established for the purpose—during the interval (*durabat* A.D. 907–60) of political disunity in China between the extinction of the T'ang Dynasty and the re-establishment of an all but oecumenical régime by the Sung.⁸ In A.D. 970 the invention of printed paper money was taken up by the Sung Government, and in China and its dependencies from that date onwards until the reign of the third Ming sovereign Yung Lo

¹ See Fitzgerald, *op. cit.*, p. 165.

² Not 400,000 but 40,000, according to Ma Tuan-Lin: *Wên Hsien T'ung K'ao*, quoting from the Dynastic History of the Prior Han, as translated in Carter, T. F.: *The Invention of Printing in China and its Spread Westward*, revised edition (New York 1931, Columbia University Press), pp. 222–3.—A.J.T.

(*regnabat* A.D. 1403-25) paper money was continuously and ubiquitously current.¹ In the latter part of the twelfth century of the Christian Era the practice was taken over from the Sung by the Kin barbarian invaders who had wrested the Yellow River Basin out of the hands of the Sung in A.D. 1124-42; and from the Kin it was taken over in succession by their more redoubtable supplanters the Mongols.²

The Mongols' sweeping conquests round all the shores of the Great Eurasian Steppe carried the western frontiers of an empire based on China up to the Euphrates and the Carpathians and thereby made China momentarily accessible to Iranic Muslim and Western Christian observers; and the paper money current in China at the time is mentioned by Marco Polo³ and at least seven other pre-Renaissance Western authors, as well as by a number of Muslim authorities.⁴ In Hülāgū Khān's appanage of the Mongol Empire in Iran and 'Irāq, in the reign of his descendant Gaykhātū Khān (*dominabatur* A.D. 1291-5), in the year A.D. 1294, an issue of printed paper notes, with a bilingual inscription in Chinese and Arabic, was uttered in the commercial capital, Tabrīz. The local business community did not take kindly to the innovation, and their protests were so violent that the issue had to be withdrawn after two or three days' trial. It has been conjectured that some of this historic but unprofitable printed paper money may have been unloaded on to the hands of the Venetian and Genoese merchants residing in Tabrīz at the time.⁵

The Utility of a Monetary Currency as a Medium for Governmental Propaganda

Who had been the principal beneficiaries from this institution of money in the divers material media in which it had been issued by innumerable governments—parochial and oecumenical, ephemeral and rather longer-lasting—since its invention in the Hellenic World in the seventh century B.C.? Undoubtedly this device had proved, on balance, a convenience in the private transactions of the issuing governments' subjects—in spite of the socially subversive fluctuations of inflation and deflation, and temptations to borrow and lend at usurious rates, which the invention had brought in its train. But a greater benefit had assuredly accrued to the issuing governments themselves; for the issue of money is an *acte de présence* which brings a government into direct and constant contact with at least an active, intelligent, and influential minority of its subjects, even where the circulation does not extend through the entire population; and this monetary epiphany—which does not cease to be

¹ Yung Lo withdrew it from circulation (no doubt in view of the inflation that had occurred in the latter days of the Mongol régime in China, and, before that, in the latter days of the Sung). No further issues of paper money were made in China till A.D. 1851, when the Manchu Dynasty, in its turn, was declining towards its fall (see Carter, *op. cit.*, p. 76).

² See Carter, *op. cit.*, pp. 72-76 and 224-5.

³ An English translation of the passage, accompanied by valuable notes, will be found in *The Book of Ser Marco Polo*, translated into English and edited by Sir Henry Yule, 3rd ed., revised by Henri Cordier (London 1903, Murray, 2 vols.; 1920, supplementary volume), vol. ii, pp. 423-30.

⁵ See *ibid.*, pp. 128-9 and 238.

impressive by becoming familiar—not only automatically fosters a government's prestige and authority; it also gives a government a magnificent opportunity for deliberately indoctrinating its subjects with sentiments, beliefs, and views.

The hypnotic effect of a coinage even on the minds of a population under alien rule who resent this political yoke and abominate the Power by whom it has been imposed, is conveyed in a classic passage of the New Testament.

"They send unto Him certain of the Pharisees and of the Herodians, to catch Him in His words. And when they were come, they say unto Him: "Master, we know that thou art true, and carest for no man; for thou regardest not the person of men, but teachest the way of God in truth. Is it lawful to give tribute to Caesar, or not? Shall we give, or shall we not give?"

'But He, knowing their hypocrisy, said unto them: "Why tempt ye me? Bring me a penny, that I may see it." And they brought it, and He saith unto them: "Whose is this image and superscription?" And they said unto him: "Caesar's". And Jesus answering said unto them: "Render to Caesar the things that are Caesar's, and to God the things that are God's".¹

'And they could not take hold of His words before the people, and they marvelled at His answer, and held their peace.'²

This automatic moral profit which the prerogative of issuing money yielded, even in a formidably adverse political and religious environment, was of incomparably greater value to the Roman Imperial Government than any mere financial gains which the management of the mint might incidentally bring in. The Emperor's likeness on a coin gave the Imperial Government a certain status in the minds of a Jewish population which not only regarded Rome's dominion as illegitimate but treasured, as the second of ten commandments believed to have been received by Moses from Yahweh *viva voce*, the explicit injunction:

'Thou shalt not make unto thee any graven image or any likeness of anything that is in Heaven above or that is in the Earth beneath or that is in the water under the Earth. Thou shalt not bow down thyself to them nor serve them; for I the Lord thy God am a jealous god.'³

When in 167 B.C. the Seleucid sovereign Antiochus IV Epiphanes had placed a statue of Olympian Zeus in the Holy of Holies of Yahweh's temple at Jerusalem, the horror and indignation of the Jews at seeing the 'abomination that maketh desolate'⁴ 'standing where it ought not'⁵ were so intense that, thenceforward, they could not rest until they had thrown off every vestige of Seleucid rule. Again, when in A.D. 26 the Roman procurator Pontius Pilate smuggled into Jerusalem, draped and under cover of night, Roman military standards bearing the Emperor's image in medallions, the reaction of the Jews was so vehement as to compel Pilate to remove the offensive emblems from the precincts of the Holy City.⁶ Yet in their holy land the Jews had schooled themselves

meekly, not only to seeing, but to handling, using, earning, hoarding, and by all these compromising actions progressively countenancing, the abominable image on Caesar's coinage, and had thereby anticipated in action the observation of their future Roman chastiser Vespasian that sordid money does not smell.¹

The Roman Government was not slow to perceive the value of an oecumenical coinage as an instrument of policy.

'From the middle of the first century onwards the Imperial Government had appreciated, as few governments have done before or since, not only the function of coinage as a mirror of contemporary life—of the political, social, spiritual and artistic aspirations of the age—but also its immense and unique possibilities as a far-reaching instrument of propaganda. Modern methods of disseminating news and modern vehicles of propaganda, from postage-stamps to broadcasting and the press, have their counterpart in the imperial coinage, where yearly, monthly—we might almost say, daily—novelties and variations in types record the sequence of public events and reflect the aims and ideologies of those who control the state.'²

The designers of the Roman imperial coinage could make play with a combination of image and superscription for giving visual form to the issuing government's political directives. The Umayyad successors of the Roman Empire in Syria, Egypt, and North-West Africa, and the innumerable Muslim governments that had succeeded the Umayyads in their turn down to the time of writing, were required to perform the still more skilful feat of conveying their messages to their subjects by superscription alone, since the Jewish tabu on graven images had been adopted by the Prophet Muhammad. In this inverted Psyche's task of spinning straw out of gold, they were fortunate in operating with a version of the Alphabet whose beauty, like that of the Sinic characters, when displayed by a master of calligraphy, could still be appreciated even by an eye whose owner's mind was illiterate. This capacity of a superscription, even when unsupported by an image, to transmit to the users of a coinage the message impressed on it by its makers was attested by the variety and abundance of the issues uttered by Muslim states.

The User's Demand for Conservatism in the Reproduction of Coin Types

There is, however, one golden rule that has to be rigidly observed if a coinage, iconic or aniconic, is to produce its psychological effect. A type that has once caught the imagination of its clientèle will not retain its hold unless it is reproduced in successive issues with blind fidelity.

The abortive first essay in an Umayyad gold and silver coinage—made by the founder of the dynasty, Mu'āwiyah, himself—is recorded

¹ 'Reprehendenti filio Tito, quod etiam urinae vectigal commentus esset, pecuniam ex primā pensione admovit ad nares, sciscitans num odore offenderetur; et, illo negante, "Atquin", inquit, "e lotio est"' (Suetonius Tranquillus, C.: *The Lives of the Caesars*, 'Divus Vespasianus', chap. xxiii, § 3).

² Toynbee, J. M. C.: *Roman Medallions* (New York 1944, The American Numismatic Society), p. 15. See further eandem: *The Hadrianic School: A Chapter in the History of Greek Art* (Cambridge 1934, University Press), pp. 2-5 and 24-159, for the 'province' coin series; p. 5 for the 'exercitus' coins; and Sutherland, C. H. V.: *Coinage in Roman Imperial Policy*, 31 B.C.-A.D. 68 (London 1951, Methuen).

to have been boycotted by the public because it did not bear on its face the reassuringly familiar symbol of the Cross which was the hall-mark of the antecedent Christian Roman mintage.¹ Vexatious experiences of this kind no doubt explain the rigid conservatism of the Attic and Achaemenian mints, which continued to strike their primitive Athenian 'owls' and Daric 'archers' in latter days when the artificers' fingers must have itched to replace these stiff archaic types by something in a more lifelike modern style. Such sedulously mummified coin-types may indeed continue not only to pass current but to be uttered for centuries after the disappearance of the government whose image and superscription they bear. Silver *dirhems* (drachmae) bearing the image of Athena's owl were still circulating in the highland fastness of the Yaman² down to the date of the Umayyad Caliph 'Abd-al-Malik's (*imperabat* A.D. 685-705) new oecumenical gold and silver issue, though by that time more than nine centuries had gone by since the native Attic issues of silver 'owls' from an Athenian mint had been discontinued by the Athenians themselves.³

After a brief taste of the novel experience of being a province of a universal state, the Yaman promptly took advantage of the weakening of the Caliphate's hold in the latter days of the 'Abbasid régime in order to revert to her familiar way of life as a 'hermit kingdom'; and in A.D. 1952 the most popular monetary medium of exchange in the dominions of the Imām of San'ā, as well as in the adjoining Arabian regions of the Hadramawt and the hinterland of Aden, was the Maria Theresa dollar of an extinct Danubian Hapsburg Monarchy which, in the Hapsburg dominions themselves, had ceased to be legal tender as long ago as A.D. 1858.⁴ The writer of this Study, when he was travelling on foot in

¹ See Wellhausen, J.: *Das Arabische Reich und Sein Sturz* (Berlin 1902, Reimer), p. 136.

² See *ibid.*, p. 136. During the interval between the annexation of the Yaman to the Medinese nucleus of the Arab Empire, in the last days of the Prophet Muhammad's lifetime, and the Caliph 'Abd-al-Malik's new issues, these Himyarite silver 'owls' were actually in circulation, in small numbers, throughout the Arab dominions, side by side with Sasanian silver and with Roman silver and gold.

³ This change of Attic coin types appears to have been made soon after the liberation of Athens from Macedonian occupation in 229 B.C. (see Ferguson, W. S.: *Hellenistic Athens* (London 1911, Macmillan), p. 245).

⁴ See Hans, J.: *Zwei Jahrhunderte Maria-Theresien-Taler, 1751-1951* (Klagenfurt 1950, Hans), p. 16.

Of the 320 million MTT that had been minted since A.D. 1751, more than 150 million had been minted within the thirty years ending in A.D. 1950 (see *ibid.*, pp. 3 and 10). Between A.D. 1751 and A.D. 1866, 82,727,621 had been minted in divers Hapsburg mints; between 1867 and 1935, 163,202,763 had been minted at Vienna; between 1935 and 1949, 72,326,022 had been minted at Vienna, Rome, London, Paris, Brussels, and Bombay (see *ibid.*, pp. 14-15). The number minted at Vienna and exported to the Levant had been 15 million in 1925 and 15½ million in 1927 (see *ibid.*, pp. 3 and 22); and, during the years 1935-9, 19,445,000 MTT, minted at Rome, had been imported by the Italian authorities into Abyssinia (p. 34).

The type of the MTT which thus made its fortune so far afield from the Queen-Empress' dominions was the issue minted at Günsburg in A.D. 1780, which was the last year of Maria Theresa's reign (p. 7). More than a hundred years later, in the last decade of the nineteenth century of the Christian Era, MTT of this type were circulating in a vast area extending in Africa from Algeria to the Upper Niger and to Madagascar and in South-West Asia as far as Maskat and Trebizond (according to a map, cited by Hans, p. 16, in Peez, C., and Raudnitz, J.: *Geschichte des Maria-Theresien-Thalers* (Vienna 1898)), and they were also circulating in China, side by side with Mexican dollars, circa A.D. 1900, according to Kann, E.: *The Currencies of China* (Shanghai 1928), cited *ibid.* In Abyssinia the MTT was the officially recognized coin of the realm from about the begin-

out-of-the-way districts of the Kingdom of Greece in A.D. 1911-12, found that gold 'Napoleons' of the French Second Empire were the most convenient coins to carry in his stocking; for the image and superscription of a bankrupt French political adventurer then still retained all their prestige in the eyes of Greek peasants and Vlach shepherds, though forty years had passed already since Napoleon III's capture by the Prussians and deposition by his own French subjects. On this showing, it might be anticipated that the English gold 'sovereign', of which Englishmen saw the last in A.D. 1914, might still be circulating in Albania for generations, and in Arabia for centuries, after that portentous date.¹

ning of the nineteenth century until the Italian occupation in the years A.D. 1936-41 (Hans, p. 24).

For more than a hundred years, dating from the Ottoman Government's unsuccessful attempt in and after A.D. 1837 to replace the MTT by the Mejidiyeh in its Arabian provinces as well as in the rest of the Empire (p. 21), the MTT triumphantly resisted repeated attempts to drive it out of circulation by the substitution of alternative metallic currencies. It did not begin to lose its hold upon the loyalty of its Abyssinian and Arabian addicts until after the liberation of Abyssinia from Italian occupation in A.D. 1941, and then it succumbed, not to any more attractive metallic currency, but to a belated adoption of the latter-day Western institutions of paper money, cheques, and bonds. In A.D. 1867 a British expeditionary force in Abyssinia had found itself compelled to import large quantities of MTT, specially minted at Vienna for its use, because the Abyssinian public had been unwilling to take payment in gold sovereigns (p. 20); in A.D. 1941 another British expeditionary force in Abyssinia found the public eager to surrender MTT in exchange for British East African paper money (see Hans, op. cit., p. 41, citing Lord Rennell of Rodd: *British Military Administration of Occupied Territory in Africa during the years 1941-1947* (London 1948, H.M. Stationery Office): see pp. 365-7, 370-1, 373-4, 379). Yet there were indications (see Hans, op. cit., pp. 50-51 and 53-54) that in A.D. 1950 the MTT was still being hoarded in large quantities in its old domain. A fine silver coin was, after all, proof against the two dangers, to which a paper note was exposed, of being eaten by termites and being devalued by politicians.

¹ During the general war of 1914-18, both the Albanians and the Arabs welcomed the opportunity of being paid by the belligerents for continuing to conduct their own inter-tribal feuds in the role of their respective foreign paymasters' partisans. So long as they might go on fighting one another, they did not greatly care whether it was the Entente Powers or the Central Powers that were financing their customary activity, but they were unanimous and intransigent in insisting that they must be paid for their services in gold, cash down—not because they foresaw a coming catastrophic depreciation of paper money with a prescience denied to the wily financiers of Lombard Street and Wall Street, but for the simpler reason that, in Albania and Arabia, an invention that had been made in China only a thousand years back (see pp. 312-13, above) had not succeeded in acclimatizing itself yet by the beginning of the twentieth century of the Christian Era. The European belligerent governments—fighting, as they were, for their lives, and therefore clutching at straws—could not resist purchasing the nominal support of rival Albanian and Arab war-bands, and, to buy this dubious asset, they ruefully disgorged some of the gold that they had so ruthlessly withdrawn from circulation at home. An amusing sequel to this war-time tragi-comedy was witnessed by the writer of this Study at the Paris Peace Conference of A.D. 1919-20. The moving spirit of the Hashimite Hijāzi Arab delegation was Colonel T. E. Lawrence, and, when he was on his delegation's official business, he used to make a point of wearing the highly distinctive uniform of an officer of the Hijāzi Army. One day, in a corridor of the Hôtel Majestic, the present writer had the good fortune to see this picturesque and animated figure run into a weary-looking official of the British Treasury. In a flash, Lawrence had whipped out from under the folds of his robe a magnificent dagger with a head of chased gold, and was holding it under the Treasury official's nose, saying: 'Do you know what that is made of?' 'No, I don't,' said the Treasury official rather testily. 'A hundred and fifty of your sovereigns,' Colonel Lawrence retorted; and the intended shock was duly registered by his victim. During the antecedent hostilities, while Colonel Lawrence had been having the fun of carrying bags of 'sovereigns' on camel-back and dispensing them to the Hijāzi allies of His Britannic Majesty's Government, the Treasury official had been saddled with the vexatious task of trying in vain to induce these Arab recipients of 'sovereigns' to part with them again in exchange for Indian piece goods, which he had dangled, like carrots, before a knowingly irresponsible donkey's nose. The Arabs had found a better use for British 'sovereigns' than that. So long as the gold remained in the form of minted coin, it might

(e) THE SERVICEABILITY OF IMPERIAL CORPORATIONS

1. *Standing Armies**The Difficulty of Creating and Maintaining a Mobile Standing Army*

Our survey of imperial installations and imperial currencies has indicated that these had been features in the life of all the universal states that had come into existence down to the time of writing; and indeed it is difficult to imagine any universal state establishing or maintaining itself without roads and postal arrangements, garrisons and colonies, a provincial organization, a capital city, one or more official languages and scripts, a code of law, a calendar, a set of weights and measures, and the rudiments or equivalents of money. By contrast, imperial corporations—standing armies, civil services, and citizenships—were to be found in the life of different universal states in various degrees of development ranging over the whole gamut between the rudimentary bud and the full-blown flower; and, because of this, they provided criteria for arranging the score of universal states on our panel in a tentative order of comparative maturity.¹

In the role played in the lives of universal states by organized military force, the extent of the variation had been particularly great.

In the history of 'the Old Empire' of the Mayas there was no certain evidence for the existence of armed forces even in the form of a police cordon to keep out barbarians from beyond the imperial frontiers. The Spanish Empire of the Indies had been almost equally innocent of armaments on land during the two centuries and more that had elapsed between the domestication of the epigoni of the *conquistadores* and the establishment of a common land-frontier between the Spanish and the British dominions in the New World in the territorial settlement after the Seven Years War. During the intervening age the only permanent professional troops in the Indies had been the few hundred halberdiers in the ceremonial bodyguards of the Viceroy of New Spain and Peru. It had not been till A.D. 1762 that the Spanish Empire in the Americas had found it necessary to provide itself with a standing army and a militia.²

In the Achaemenian Empire, the Caliphate, and the Mughal Rāj the

(they felt) slip through their fingers; so they had converted it into dagger handles, which were not only more beautiful but more secure, since they could be carried more snugly on the person and were riveted to an automatic caretaker in the shape of a formidable steel blade.

¹ Of our twenty-one civilizations, the Hittite, Iranic, Arabic, Mexic, and Yucatec had apparently failed to produce universal states. On the other hand, the Egyptian, Syriac, Indic, and Far Eastern societies had produced recurrent universal states, while, in the histories of the Sumeric, Hindu, Andean, and Russian universal states, there had been a break of continuity which not only permitted but constrained a student of History to treat as separate instances the Sumerian régime at Ur and the Amorite régime at Babylon; the Mughal Rāj and the British Rāj; the Incaic Empire of the Andes and the Spanish Empire of the Indies; and the pre-Petrine dispensation and the post-Petrine dispensation in Russia. See the table of contents of the atlas in vol. xi.

² Haring, C. H.: *The Spanish Empire in America* (New York, 1947, Oxford University Press), pp. 124, 125, and 145. The Empire of the Indies was not, of course, as defenceless as it might appear to have been, for down to A.D. 1763 it was more or less effectively insulated by the Spanish Navy from direct contact with the dominions of any other Power except France in Louisiana.

standing army included garrisons at strategic points along the frontiers¹ and in the interior² as well as the emperor's personal bodyguard at the headquarters of the imperial administration;³ the 'small but efficient standing army', which even the later Mughal emperors managed to keep up 'consisted of cavalry and matchlockmen, and its kernel was the imperial park of artillery, without which no great fortress could be forcibly reduced';⁴ but, when there was a call for mobile armies of any considerable strength, all three empires depended upon levies *ad hoc*. In all three the first ban was furnished by the imperial people itself. The Mughal and Achaemenian empires could call up their feudal cavalry, and the Caliphate its henchmen quartered in the cantonments (Arabs under the Umayyad Caliphs and Khurāsānīs under the 'Abbasids). When, however, it was a question of a major military enterprise, these empires had to call upon the population at large.⁵ When Xerxes invaded European Greece in 480 B.C., he not only mobilized his personal bodyguard and his Persian fief-holders and the rest of the manhood of the Perso-Median imperial people; he also raised levies from the subject population of all the provinces.⁶ The regular spring and autumn raids from Cilicia into the East Roman Empire which were one of the institutions of the Caliphate for some two hundred years, until the tide of war turned in the East Roman Empire's favour at last in the second quarter of the tenth century of the Christian Era, were made by Muslim volunteers from all over the Caliph's dominions who assembled and dispersed behind the double screen of fortresses known as the Thughūr and the 'Awāsīm.⁷

On the other hand, standing armies capable of providing mobile forces for campaigns, besides imperial bodyguards and provincial garrisons, were maintained by the Roman, Han, Manchu, Ottoman, Danubian Hapsburg, and Napoleonic empires, by the British Rāj in India, and by the post-Petrine Russian imperial régime.⁸ The histories of these standing armies show that mobility is difficult to maintain. With the lapse of time a mobile professional force tends to degenerate into a sedentary militia.

The Danubian Hapsburg Monarchy and the British Rāj counteracted this tendency by deliberately organizing a local militia, distinct from the mobile army, to man chronically restless *limites*. There were the Croat

⁴ Spear, T. G. P.: *Twilight of the Mughuls* (Cambridge 1951, University Press), pp. 7-8. 'The Mughul train of artillery, in maintaining internal security, had something of the potency of the Tudor monopoly of gunpowder. The artillerymen were generously paid, Europeans were freely engaged at high rates, and even supplied with servants so that they should be relieved of all labour save that of aiming the guns' (*ibid.*, p. 8).

A detailed account of the Mughal artillery is given in Irvine, W.: *The Army of the Indian Moghuls* (London 1903, Luzac), chaps. 10-12.

⁵ See p. 183, above.

⁶ See the army list in Herodotus, Book VII, chaps. 61-99.

⁷ See II. ii. 368, with n. 1, and the present volume, p. 121, above.

⁸ After the Russian Empire had been equipped with a Western-model professional army by Peter the Great, efforts continued to be made to improve this army's professional standards. In A.D. 1731 an officer's cadet corps was founded, with places for 150 Russian nobles and 50 Livlanders. In A.D. 1732 garrison schools were started (see Mettig, C.: *Die Europäisierung Russlands im Achtzehnten Jahrhundert* (Gotha 1913, Perthes), pp. 82 and 314).

and Serb territorial regiments which, in the eighteenth and nineteenth centuries of the Christian Era, held the line of the Save for the Hapsburg King-Emperor against their Bosniak and Turkish hereditary adversaries;¹ and there were the Pathan militias whom the British Indian military authorities on the North-West Frontier of India recruited during the century beginning in A.D. 1849 from among the wild tribesmen on the principle of setting a thief to catch a thief. These Danubian Hapsburg and British Indian sedentary *limitanei* were of minor importance compared to the mobile armies which they supplemented, whereas in the Ottoman military system the Kurdish *foederati* who, under the command of their own tribal chiefs, held the Ottoman frontier over against Persia,² and the Turkish feudal cavalry whose fiefs were sown thick over the Empire except in the more remote of the Arab provinces,³ together considerably outnumbered the Pādishāh's Slave-Household. Yet the existence of this border militia and provincial feudal array did not preserve the Janissaries, after the death of Suleymān the Magnificent, from losing their mobility and changing, in their turn, into a militia, cantoned in Constantinople and the provincial capitals, which became ever more unwarlike and ever more seditious *pari passu*, till there was nothing to be done with this once magnificently soldierly force except to annihilate it in order to rebuild an Ottoman professional army from the foundations—this time on an alien new model derived from the West.⁴ In the Manchu and Roman empires the originally mobile 'banners' and legions likewise struck root through vegetating in fixed stations—the 'banners' in the interior of China and the legions on the frontiers of the Roman World.

The Creation of a Mobile Standing Army in the post-Diocletianic Roman Empire

In the history of the Roman Imperial Army this loss of mobility—of which the danger did not become apparent so long as the prestige of the Empire stood so high that no outsider ventured seriously to attack it⁵—was one of the causes of the catastrophe in which the Empire all but came to grief in the third century of the Christian Era. The improvisation of a new mobile army was the creative act of that desperate age; and, though it was achieved in adverse circumstances at the eleventh hour, it proved so great a success that it prolonged the life of the Empire for one and a half centuries even in the West and for three and a half centuries in the East and the Centre.⁶

⁵ See p. 184, above.

⁶ This impressive chronological evidence of the success of the Diocletiano-Constantinian reorganization of the Roman system of imperial defence would seem, to a layman's eyes, to suffice in itself to refute Zosimus's savage critique of it in his *Historiae*, Book II, chap. xxxiv. Zosimus submits that the withdrawal of units from the frontiers to create a mobile reserve in the interior exposed the Empire to uncontested invasion, located the troops in places not requiring defence, brought ruin upon the cities in which they were stationed, and demoralized the troops themselves in the process. Zosimus does not mention the telling truth that, during the century ending in A.D. 284, when the

The truth that a military force can be kept mobile only by relieving it of sedentary tasks had been perceived and translated into action by the genius of Julius Caesar. Out of the thirty-two legions that he had in hand at the close of his civil wars, he posted twenty-six on the frontiers and kept six in reserve.¹ Thereafter, Augustus posted all his twenty-eight legions² on the frontiers³—whether from lack of his adoptive father's strategic insight or because a further bout of civil wars had left him with that amount less of man-power and sinews of war at his command.⁴ Apart from the 4,500 men in the nine praetorian cohorts constituting the Emperor's personal bodyguard⁵ and the 1,500 men in the original three urban cohorts,⁶ which—as their designation ('Metropolitan Battalions') pointedly proclaimed—were a semi-civic force, Augustus's army possessed no striking force, no field army, no reserves, and the only means of reinforcing the garrison of one sector of the imperial frontier was the drafting of a detachment (*vexillatio*) from the garrison of another sector.⁷ Domitian carried the process of immobilizing the legions one stage farther by ruling that each legion was to have a camp of its own.⁸ After Hadrian had made a rule of the already prevailing tendency for the legions, like the *auxilia*, to be recruited locally,⁹

Augustan system of frontier defence had still been in operation, the Empire had suffered far more grievously from barbarian invasion than it suffered thereafter, under the new system, during the century ending in A.D. 378. His flagrantly incorrect ascription of the Augustan system to Diocletian, the pagan innovator whose reforms a Christian Constantine had merely carried through to completion, seems to indicate that Zosimus's critique of a policy which he falsely attributes to Constantine's initiative was at least partly prompted by religious animus.

¹ See Grosse, R.: *Römische Militärgeschichte von Gallienus bis zum Beginn der Byzantinischen Themenverfassung* (Berlin 1920, Weidmann), p. 55.

² This appears to have been the establishment of Augustus's standing army in 16 B.C. The number was reduced to 25 by the loss of three legions in Vespasian's campaign in Germany in A.D. 9. This number was raised to 27 by Gaius or (more probably) by Claudius. By the end of the civil wars of A.D. 69 the number had perhaps risen to 31. It was reduced to 29 by Vespasian, but had been raised again to 30 by A.D. 83; and this seems to have been regarded as the standard establishment for the next 110 years. To maintain this figure, Trajan appears to have replaced one legion lost by Domitian in Sarmatia in A.D. 92, and another lost by himself, and Marcus Aurelius to have replaced two lost (perhaps) by Hadrian in Britain and in Palestine respectively. Thereafter, Septimius Severus raised the standing army to a higher strength than it had ever yet possessed by adding his three *Legiones Parthicae* to Marcus's thirty (see Parker, H. M. D.: *The Roman Legions* (Oxford 1928, Clarendon Press), chaps. 3 and 4, pp. 72–117, and compare the *Cambridge Ancient History*, vol. x (Cambridge 1934, University Press), pp. 123 and 221).

³ See p. 184, above.

⁴ At the moment when this final bout of civil wars was brought to an end by the overthrow of the last of Augustus's competitors for the mastery of the Roman World, the victor had on his hands perhaps as many as sixty legions. In his *res gestae*, Augustus claims to have replanted 300,000 discharged soldiers in civilian life by either repatriating them in their original communities or settling them in new colonies. Twenty-eight legions was presumably the maximum establishment that, in Augustus's view, an exhausted world could be expected to support.

⁵ The original strength of both a praetorian and an urban cohort was 500 men. The strength of the praetorian cohorts was raised from 500 to 1,000 momentarily during the crisis of A.D. 69 and then permanently in A.D. 193 by Septimius Severus. Septimius also raised the strength of the urban cohorts from 500 to 1,500 (see Durry, M.: *Les Cohortes Prétoiriennes* (Paris 1938, Boccard), pp. 82–87).

⁶ For these, see pp. 123 and 184, above. By Vespasian's time (*imperabat* A.D. 70–79) the number of urban cohorts appears to have risen to four stationed in Rome and the two posted in the provinces at Lyons and at Carthage respectively (see the *Cambridge Ancient History*, vol. xi (Cambridge 1936, University Press), p. 135).

⁷ See Grosse, op. cit., p. 55.

⁸ See Suetonius Tranquillus, C.: *The Lives of the Caesars*, 'Domitianus', chap. 7.

⁹ See Durry, op. cit., p. 246.

and had carried to completion the Augustan system of fixed frontier defences, 'the whole Roman Army was degraded into being a bevy of gendarmes and customs officials'.¹ In the third century, 'when the whole empire became one single gigantic fortress assaulted simultaneously from all sides, the old method of frontier-defence inevitably proved totally inadequate, and the need for a strong field army that could be brought into action rapidly at any point inevitably declared itself ever more insistently'.² Before the third century was over, this need had been met. Gallienus (*imperabat* A.D. 260-8) made a beginning by detaching the cavalry from the legions and grouping them under an independent command,³ and the work of reorganization was continued by Aurelian (*imperabat* A.D. 270-5)⁴ and was completed by Diocletian (*imperabat* A.D. 284-305).

Out of the best of the battered units of the Augustan Army, without any discrimination between legionary *vexillationes*⁵ and auxiliary cohorts and *alae*, the third-century reformers built up a mobile army of all arms; and, within this category of troops trained and equipped to accompany the emperors on campaign (*Comitatenses*),⁶ there were gradations of mobility, proficiency, and privileged proximity to a throne that dire necessity of state had now transformed into a portable camp-stool which was pitched from day to day wherever the need for the emperor's presence might happen at the moment to be the greatest.⁷ Within the *Comitatenses* there came to be an *élite* of *Palatini*,⁸ an inner guard composed of the *Scholae*⁹ and the *Candidati*, and a personal bodyguard of *Protectores* and *Domestici*¹⁰ who provided the new mobile army with the

¹ Grosse, op. cit., p. 56.

² Ibid., p. 56.

³ See *ibid.*, pp. 15, 18, and 56.

⁴ See *ibid.*, pp. 56-57.

⁵ By Diocletian's time the Augustan legions seem to have been already broken up into detachments (*vexillationes*) of the strength of the cohorts which had always been the units of the *auxilia* and had also been the principal subdivisions of the legions themselves since the reforms of Marius. At the same time the auxiliary cohorts of infantry and *alae* of cavalry had become detached from the legions with which they had been brigaded under the Principate. After this dissolution of the Augustan legion of 10,000 to 12,000 men (including its complement of *auxilia*), the name legion came to denote a *vexillatio* of perhaps no more than 500 men. The fifth-century *Notitia Dignitatum* catalogues 174 legions, as against the 33 in the army of the Principate after the addition of three to the previous total by Septimius Severus (see Grosse, op. cit., pp. 30-32).

⁶ A Latin inscription (*C.I.L.* vi. 2759) witnesses that the *Comitatenses* were in existence at latest by A.D. 301 (see Grosse, op. cit., p. 59).

⁷ After the foundation of Constantinople on a site where the new political capital of the Roman Empire could simultaneously serve as a military base for the defence, in depth, of both the Lower Danube and the Upper and Middle Euphrates frontier (see pp. 217-18, above), the Imperial camp-stool was pitched here more often than not; and this concentration of the Imperial headquarters to the shores of the Bosphorus is reflected in the location of the standing cantonments of the *Comitatensian* infantry legions (excluding the *Palatini*) according to the *Notitia Dignitatum*. No less than twenty of these units were cantoned in Thrace, as compared with nine apiece in Oriens and Gaul, eight apiece in Eastern Illyricum and Africa, and five apiece in Western Illyricum, Italy, and Spain (see Grosse, op. cit., p. 90).

⁸ First heard of in A.D. 365 (see *ibid.*, p. 61). The name was, of course, by that time an anachronism; for it was more than a century since the Roman Empire had been governed from the Palatine Hill.

⁹ The *Scholae*, once unofficial clubs organized by officers, in the Empire's halcyon days, to provide amenities for their leisure hours, had become part of the working organization of the Army in consequence of their feat of surviving the general dissolution of institutions in the third century.

¹⁰ The Praetorian Cohorts had perished in the last gusts of the hundred-years-long social tornado by which the Roman Empire had been ravaged. Diocletian had depressed

equivalent of a much-needed staff college.¹ The leavings of the Army, when the mobile *Comitatenses* had been formed out of it, were assigned to a frontier force (*Ripenses*, *Riparienses*, *Limitanei*)² which was frankly permitted to be the sedentary militia³ that the Army of the Principate had tended to become *sub rosa*⁴ ever since it had been cantoned along the frontiers by Augustus, while the mobile standing army embodied in the *Comitatenses* constituted at last, after a dearly paid-for delay of nearly 350 years, that mobile reserve which had been designed, on a smaller scale, by *Divus Iulius*.⁵

Esprit de corps

The superiority of a mobile standing army over a sedentary militia in professional technique is surpassed both in degree and in importance by its superiority in *esprit de corps*. A militiaman tends to be drawn back into civilian life and ethos by a fixed domicile, by marriage, and by the pressure on him to engage in gainful occupations in order to support a family which cannot live on a soldier's pay. This masterful process of demilitarization overtook the Roman Army of the Principate after the removal, by Septimius Severus, of the ban on marriage while with the colours,⁶ and it overtook the Janissary Corps after the relaxation of its discipline upon the death of Suleymān the Magnificent. By contrast, a professional soldier in a mobile standing army is 'conditioned' by an insulating way of life and a differentiating discipline into being first and

their status and reduced their importance by keeping them at the long since evacuated seat of imperial government at Rome (Grosse, op. cit., p. 59, citing Aurelius Victor, 39, 47, and Lactantius, *De Mortibus Persecutorum*, 26). Thereafter, Constantine the Great had abolished them after they had fought on the losing side at the Battle of the Milvian Bridge on the 28th October, A.D. 312 (see Durry, op. cit., pp. 170 and 393; Grosse, op. cit., p. 60).

¹ See *ibid.*, pp. 61-63 and 93-96.

² See *ibid.*, pp. 66 and 68.

³ We are ignorant of the date at which the soldiers of the frontier garrisons became *adscripti glebae* by being given personal and hereditary holdings of land to cultivate, but there is no doubt that, from the fourth to the sixth century of the Christian Era, the frontier troops were in fact 'a militia of sedentary peasants' (*ibid.*, pp. 64-65).

⁴ In theory the Army of the Principate was always mobile, and the symbol of this theory was the legal inability of the serving soldier to contract a valid marriage so long as he was with the colours. Considering, however, that, upon a soldier's honourable discharge, a permanent illicit union could be converted into a legal marriage and children already born of it be legitimized retrospectively (see p. 132, above); that the soldiers' families were allowed to live in civilian *canabae* adjoining the camps; and that the men were free, while still on active service, to cultivate the *prata legionum*, it is evident that the difference *de facto* between the pre-Severan legionary and the post-Diocletianic *limitaneus* was not by any means as great as the difference in theory. The rights of contracting a legal marriage while on active service and of leasing plots in the *prata legionum* were granted to soldiers by Septimius Severus (see Grosse, op. cit., p. 248; *The Cambridge Ancient History*, vol. xii (Cambridge 1939, University Press), p. 32).

⁵ Not the least part of this price of a long delay was a formidable increase in the total strength of the Army in an age when the economic resources of the Empire were dwindling. Even after Septimius Severus had increased the number of the legions from 30 to 33, the Army of the Principate had amounted to not much more than 300,000 men. Diocletian raised the figure by perhaps something like two-thirds, from about 300,000 to about 500,000 (see Grosse, op. cit., p. 253). Within this total, the field army may have had a nominal strength of 148,000 infantry and 46,500 cavalry (see *ibid.*, p. 254).

⁶ See Grosse, op. cit., p. 248. In the post-Diocletianic Army, both the soldier and his wife (if he were married in lawful wedlock) were tax-free after he had completed five years' service (see *ibid.*, p. 202). Nevertheless, private soldiers as well as officers were still apt to get entangled in civilian business concerns in the sixth century of the Christian Era (see *ibid.*, p. 278).

foremost a member of his corps and paying only a secondary and conditional allegiance to the civilian community which bears the cost of keeping him under arms; and, if and when the interests of community and corps diverge, the professional soldier is apt to become, in relation to the community, that portentous creature, the unsocial human being, who, as Aristotle sees him, is 'either a beast or a god'.¹ In this predicament the professional soldier can, indeed, either sink to a depth of inhumanity or rise to a height of heroism that are alike beyond the range of his brethren who have not put themselves outside the pale of civilian life through being initiated into a professional military fraternity.

In sacrificing himself to his professional duty the soldier is, of course, happiest when *esprit de corps* gives the same orders as patriotism.

ὦ ξείν', ἄγγελον Λακεδαιμονίοις ὅτι τῆδε
κείμεθα, τοῖς κείνων ῥήμασι πειθόμενοι

and this famous epitaph by Simonides on the Three Hundred Spartans who fell, to the last man but one,² at Thermopylae was to inspire a worthy counterpart in Housman's epitaph on a British army of mercenaries that likewise faced and met certain death in pitting itself against overwhelming odds in order to purchase eventual victory for its cause by checking the first onset of a formidable invader.

These, on the day when Heaven was falling,
The hour when Earth's foundations fled,
Followed their mercenary calling
And took their wages and are dead.

Their shoulders held the sky suspended;
They stood, and Earth's foundations stay;
What God abandoned, these defended,
And saved the sum of things for pay.

No doubt, in all situations, the professional soldier's First Commandment is

Theirs not to reason why,
Theirs but to do and die;

yet there are degrees of heroism which can be measured by the desperation of the situation in which the soldier obeys the call to give his life. The Spartan soldier who died in 480 B.C. and the British soldier who died in A.D. 1914 in the act of saving a civilization was not confronted with so severe an ordeal as the Assyrian soldier who, in 610-609 B.C.,³ made the same supreme personal sacrifice in the baneful cause of striving to undo the World's accomplished deed of liberating itself from the scourge of Assyrian militarism; for the *moral* of Assyria's last army, which took the field again and perished in that last campaign, had been proof against the shock of seeing Assyria herself laid desolate and her fortress-capital Nineveh taken by storm and put to the sack two years

¹ Aristotle: *Politics*, Book I, chap. i, §§ 9-12 (p. 1253A), quoted in I. i. 173, n. 3.

² The tragic story of the sole survivor Aristodamus has been told, with sympathetic insight, by Herodotus, Book VII, chaps. 229-31, and Book IX, chap. 71 (see III. iii. 63, n. 3).

³ See IV. iv. 475 and 480.

earlier.¹ In 610 B.C. Assyria still lived within a defeated but undismayed army's lines at Harrân, as in A.D. 1848 Austria survived in Radetsky's camp within the Quadrilateral of Hapsburg fortresses in Lombardy.

In deinem Lager ist Österreich,
Wir Andern sind einzelne Trümmer.²

While manfully standing to arms for a new trial of strength with adversaries who had won the preceding round, the Assyrian army in 610 B.C. hoped as sanguinely against hope as Radetsky's army in A.D. 1848 that, this time, they would retrieve their country's fortunes by rescuing her from the very jaws of destruction. While the Assyrians duly failed in their forlorn hope, Radetsky's army played a capital part in winning for the Danubian Hapsburg Monarchy a seventy years' reprieve from her eventually inevitable doom of disruption by the mounting force of Nationalism.³ Yet, though Radetsky's success might be less romantic than the Assyrians' failure, it was the fruit of a greater *tour de force* in the art of leadership.

The Assyrian army of 610 B.C., like the British Light Brigade of A.D. 1854 and Expeditionary Force of A.D. 1914, was a military formation of a homogeneous national texture fighting in its own national cause without any conflict of mutually incompatible loyalties, whereas the Austria that, in A.D. 1848, was incarnate in Radetsky's camp on the banks of the Po was a miniature reproduction of the house divided against itself in the valley of the Danube. The troops who in that year held together in Lombardy under Radetsky's command had to withstand a twofold psychological assault upon their *esprit de corps*. They were being asked to go on fighting for a state which not only appeared to have dissolved already in their rear, but which, for many of them, was not their own country but was, rather, their country's hereditary oppressor whose yoke had just been broken, not by their Italian opponents in the field, but by their own kinsmen on the home front in a revolutionary upheaval that was threatening to rankle into an outright civil war. Radetsky's army in the Quadrilateral was a mixed multitude in which German

¹ This steadfastness of Assyrian military *moral* in 610-609 B.C. will appear the more remarkable when it is recalled that, although by that date the Assyrian state had been in serious adversity for no longer than about sixteen years, since the death of Assurbanipal in 626 B.C., the Assyrian soldier had been living under a severe personal strain for more than a hundred years past, ever since the opening of the fourth and final bout of Assyrian militarism in 745 B.C. (see IV. iv. 476-7) had first carried him away from home on distant, protracted, and consecutive campaigns. In the fragments of Assyrian law, dating from an earlier chapter of Assyrian history, that Modern Western archaeologists had recovered, a significantly high proportion of the legislation was concerned with situations arising from a soldier's return home from foreign service after so long an absence that his wife had given him up for dead. (Convenient English translations and commentaries will be found in Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), pp. 233-45, and in Pritchard, J. B.: *Ancient Near Eastern Texts* (Princeton 1950, Princeton University Press), pp. 180-8.) An Englishman who had lived through the World War of A.D. 1939-45 would be reminded of the similar marital troubles arising from the absence of British troops from home for years on end in the Middle East and Burma. A student of Roman history would be reminded of the personal strain on the Roman peasant-soldier during the four generations that elapsed between the beginning of the Hannibalic War and the creation of a professional army by Marius.

² Grillparzer, Franz: *Feldmarschall Radetzky* [written at the beginning of June 1848].

³ See II. ii. 182-6.

Austrians found themselves cheek by jowl with Magyars whose kinsmen at home were repudiating a German ascendancy, and with Slavs whose kinsmen—in the hope of winning Imperial-Royal support in their struggle to throw off the ascendancy of German and Magyar alike—were rallying to a refugee King-Emperor whose flight from Vienna had been as humiliating as Radetsky's ejection from Milan. When full allowance has been made for the momentum of a habit of co-operation that had been inculcated by more than two centuries of professional military discipline, it will still seem little less than a miracle that Radetsky's troops did not turn their arms against one another when their spirits, already depressed by the experience of defeat at the front, were further unsettled by the news of national uprisings in their rear.¹

Die Gott als Slav' und Magyaren schuf,
Sie streiten um Worte nicht hämisch,
Sie folgen, ob deutsch auch der Feldherrnruf,
Denn: Vorwärts! ist ung'risch und böhmisch.²

A greater miracle of the same kind was worked by the *esprit de corps* that, in the Tropical African theatre of the World War of A.D. 1914-18, kept von Lettow-Vorbeck's Bantu askaris in the field for more than four years in a cause that was not their own, with no hope at all of reinforcements, and none of fresh supplies except such as they might succeed in capturing from the enemy. Yet the armistice imposed on them by Ludendorff's failure of nerve in a reverse that had not yet carried the war on to German territory in Europe found these mercenary askaris still fighting gamely for their German masters in Portuguese East Africa after having been driven out of German East Africa by the tardy pressure of a decisively superior enemy force. Equally noteworthy was the loyalty to the British Rāj, during the mutiny of the East India Company's older sepoy-troops in A.D. 1857-8, of the regiments then daringly recruited from a warrior community of Sikhs who, only nine years before, had

¹ The *esprit de corps* of the Austrian Army, which gave such a good account of itself in Radetsky's camp in Lombardy in A.D. 1848, eventually succumbed to the ordeal of the World War of A.D. 1914-18. In that war, Czech regiments deserted *en masse* to their Russian fellow Slavs, and after the armistice of 1918 the Army of the Isonzo, as it drifted back from a defensive campaign which, with German help, it had carried on to enemy territory, dissolved into mutually hostile national elements. This end of an army that had been called into existence, four hundred years back, to defend the eastern flank of Western Christendom against the 'Osmanlis, had been described to the writer of this Study by an Austrian friend of his who, being at that moment a civilian, had been caught in the eastward-ebbing tide of self-demobilizing troops as he was trying to make his own way, across the current, from Graz to Innsbruck. The Imperial-Royal comrades-in-arms of yesterday, as they sorted themselves out into Czechs, Germans, Magyars, Poles, Ukrainians, Rumanians, and Yugoslavs, were eyeing one another suspiciously, with forebodings of the fratricidal conflicts into which they were to be drawn on the morrow. Since Radetsky's day the unitary tradition of a once professional Austrian Army had been undermined by the introduction of universal compulsory short-term military service, which, in a general mobilization, inevitably filled the cadres to bursting-point with men who were civilians and nationalists at heart while they were soldiers and servants of the King-Emperor against the grain. Yet, even in this war that was the old Austrian Army's death, the Hungarian, German, and Polish subjects of the Dual Crown, whose national interests happened to coincide with the interests of the Monarchy, still gave a good account of themselves; and the Croats, among whom a military tradition of personal loyalty to the Dynasty was still alive, fought valiantly against their Serb fellow Yugoslavs.

² Grillparzer, *op. cit.*

fought the British for the second time and, this time, had paid for a second defeat the penalty of forfeiting, at one stroke, their ascendancy over the other communities in the Panjab and their own political independence. Yet all these signal triumphs of professional *esprit de corps* were surpassed by the unsung achievement of the sepoy mutineers themselves, in which the honours had to be divided between the British officers who had once inculcated the discipline and the Indian non-commissioned officers and privates who succeeded in maintaining it in spite of the deadly wounds which they had dealt to their own *moral*. The mutineers had committed the militarily and morally unforgivable sin of breaking faith with their employers and murdering their superiors; and by this treachery they had deprived themselves of an alien leadership which had held together a mixed multitude of mutually antipathetic Hindus and Muslims and had welded them into a professional army that had not met its match east of Indus. Yet, disabled though they were by these self-inflicted handicaps, they had the spirit to challenge their British makers, and in the ensuing struggle they came within an ace of repeating the feat of those Mamlûks who, in Egypt six hundred years earlier, had wrested the sceptre irrevocably out of the hands of their Ayûbid masters.¹

The Problem of Controlling Alien or Barbarian Troops

This professional military *esprit de corps* is both more necessary and more notable in a universal state than it is in a parochial state; for, in contrast to the standing armies of parochial states, which are usually homogeneous in their personnel, the armies of universal states are usually composed of heterogeneous elements that have to be inspired by artificial influences of discipline and tradition with a community of feeling which the recruit does not bring with him, ready-made, from civilian life. While one of these artificially associated elements, and this the leading one, had generally, though not invariably, been the imperial people itself, the empire-builders, however generous they might have been in taking outsiders into their ranks, had seldom had the numbers or the strength to win and hold their empire unaided. In most of the universal states that had come into existence up to date, the rulers had found it expedient to take into military partnership in their standing armies the military *élite* of their subjects within their frontiers or of the barbarians beyond their pale, or even to enlist representatives of an alien civilization.

The unpopularity of the Napoleonic Empire, which was one cause of its premature fall, was due in large measure to the 'blood-tax' which Napoleon imposed not only on the French but on the non-French populations incorporated into the Empire and on the peoples of the client states. When he invaded Russia in A.D. 1812, he compelled even Prussia and Austria to furnish contingents—if only as hostages to ensure that these two discomfited Great Powers should not rise and attack him in the rear after he had traversed their dominions on his eastward march. In the Grand Army that started to cross the Niemen on the

¹ See III. iii. 30-31.

24th June, 1812, only about 120,000 out of 363,000 men were Frenchmen.

The Mongols swiftly won and momentarily held their far-flung dominion over the sedentary peoples round the periphery of the Great Eurasian Steppe by first taking into partnership all but a small fraction of the rest of the Eurasian Nomads and then drafting troops from one conquered sedentary sub-continent to assist in the conquest of another. In the Mongols' service Chinese military engineers played their part in the capture of Transoxanian cities, while Muslim troops from Transoxania, and Orthodox Christian Alan cavalry from the northern slopes of the Caucasus,¹ were brought into action in China against the recalcitrant Empire of the Sung.

The Mughal conquerors of India reinforced their own scanty numbers with drafts of fellow Muslims from an Iranic World out of which they themselves had issued; and in their dearth of martial man-power they did not hesitate to accept recruits from among the barbarous Uzbegs who had driven Bābur out of Farghānah and the heretical *gyzyl-bāshis* with whom he had allied himself, against his conscience, in a vain attempt to recover the Transoxanian heritage of his ancestor Timur from the Uzbeg invader.² Yet even the most generous-handed sharing of the spoils of India with fellow Iranic Muslims enlisted at the eleventh hour did not give the Mughals the strength to complete the conquest of the peninsula, or even to hold securely what they had already won, against the obstinate resistance of the epigoni of earlier Muslim conquerors; and they found themselves constrained to sin against the spirit and tradition of Islam by enlisting the services of the infidel chivalry of their Rājput client states in their fratricidal wars against their True Believing rivals.

The Achaemenian Empire, which on the military plane was perhaps the least efficient of all the universal states in our catalogue, exposed its own incompetence to the World and to itself by embarking on the formidable enterprise of trying to conquer European Greece. The humiliating outcome of the thirty years' war (480-450 B.C.) that Xerxes had wantonly brought upon himself and his successors convinced the Achaemenian Government of their need for a mobile standing army; but, instead of building up one of their own out of the excellent military man-power and abundant economic resources that the Empire could afford, they contented themselves with the unimaginative, slovenly, expensive, and dangerous makeshift of hiring Greek to meet Greek. After the break-down of the Hellenic Civilization had been signaled by the outbreak of the Atheno-Peloponnesian War, the daric could purchase any number of seasoned soldiers from among the uprooted citizens of the faction-ridden city-states of Hellas; but, of course, the latter-day Achaemenids' Greek mercenary army, so far from arresting the Hellenic Society's counter-offensive, invitingly blazed a trail for their fellow Hellenes into the heart of South-Western Asia. After ten thousand Greek mercenary troops in an Achaemenid pretender's

¹ See the passages of Marco Polo quoted in V. v. 350-1.

² For this episode in Bābur's history, see I. i. 375-80.

service had demonstrated their ability to march unhindered from Ephesus to Cunaxa and back again from Cunaxa to Trebizond, it was evident that the thirty-six thousand Greeks whom Alexander led across the Hellespont would suffice to overthrow the Achaemenian régime and to conquer the Empire from the Aegean to the Pamirs.

The fate of the Arab Caliphate shows that a standing army of barbarians from beyond the pale may be almost as great a political danger as one recruited from the *déracinés* of an alien civilization. When, on the Khurasanian frontier of the Umayyad Power, the local garrisons of Arab empire-builders had fraternized and blended with comrades-in-arms enlisted from the local Iranian subject population,¹ the ruling element in the Caliphate had been strengthened by this broadening of its basis. But when, after the revolution that had brought the 'Abbasids into power, the Khurāsānī henchmen of the new régime were supplanted, in their turn, by Turkish mercenaries from beyond the Oxus, the mastery of the Caliphate passed first to these Transoxanian Turkish praetorians and eventually to the Nomad Turkish Saljūqs from the Eurasian Steppe. In 'the New Empire' of Egypt a similar consequence followed from the recruitment of a mercenary army of Minoan *déracinés* and Achaean and Libyan barbarians. Though this hazardous expedient appeared to have vindicated itself when, at the turn of the thirteenth and twelfth centuries B.C., the barbarians in the Egyptian service loyally assisted their native Egyptian comrades-in-arms to repel successive waves of barbarian invasion,² the policy stood condemned when, in the event, the discomfited Libyans sauntered back, unopposed, into the Egyptian World and settled down upon the land as an incubus-militia.³

The 'Osmanlis in their heyday were unique among empire-builders in debarring the imperial people itself from participation in either the defence or the government of their empire, and in relying exclusively on the services of subjects and aliens. In a different context⁴ we have seen how they achieved this *tour de force* by detaching their recruits from all previous ties of family, nationality, and religion, and reconditioning them through a strenuous course of broadly conceived and skilfully devised education. The system was so efficient that it produced its transforming effect not only upon tribute-children subjected to it at a tender age but also upon adult prisoners-of-war and renegades; but, when the system broke down owing to the defiance of human nature which was the price at which its efficiency had been purchased, and the free Muslim population of the Empire was grudgingly admitted to a long-overdue participation in public power and responsibility, the Ottoman Empire began to go the way of the 'Abbasid Caliphate and 'the New Empire' of Egypt.

When the long military retreat that had started under the walls of Vienna in A.D. 1683 was converted into a rout by the disastrous outcome of the Great Russo-Turkish War of A.D. 1768-74, both the Sublime

Porte and its increasingly independent lieutenants in the provinces found themselves leaning on a broken reed in their belated reliance on a free Turkish squirearchy and peasantry that were untutored alike in the old Ottoman school of warfare followed by the Pādishāh's now demoralized Slave-Household and in the new Western school that had originally been inspired by an Ottoman ensample. In these straits the distracted rulers of a tottering empire turned, in their desperate search for martial man-power, to the rude but still untarnished valour of barbarian Albanians and Bosniaks.¹ In Continental European Greece they even authorized the enrolment of a militia of Christian Greek highlanders, under native captains, to guard the passes.² And, on the analogy of what happened in other universal states in similar situations in which the process was not checked by the intervention of a third force, we may guess that these and other barbarians would have duly entered into the Ottoman heritage if the Ottoman World had not fallen, at that juncture, under the shadow of the West.³ As a result of this new turn in their fortunes, the 'Osmanlis succeeded in building up a new Western-model Ottoman Army which put the pashas' Albanian house-carls out of business, brought the Kurdish tribes to heel, saved the Turkish core of the Empire from being partitioned by the European Powers, and eventually shepherded their country into the fold of Western political life as an independent Turkish national republic.⁴

The ruling element in the British Rāj in India, like the rulers of the Spanish Empire of the Indies, were peculiar in being a company of pilgrims and sojourners who were neither born nor educated nor superannuated nor buried within the bounds of the universal state that they garrisoned and governed during the prime of their working lives;⁵ and in British India, which, unlike the Spanish Indies, found itself unable to dispense with a standing army, this permanent geographical and social segregation of a West European imperial people from an Indian subject population was a military safeguard, though in some ways a political stumbling-block.

The standing army of the British Rāj in India was composed of three elements: West Europeans from the United Kingdom, Indians from British Indian territory and from the Indian client states, and barbarians recruited mainly from the independent Gurkha states of Nepal and Bhutan and from the autonomous Pathan tribes in the zone between the north-western boundary of British-administered Indian territory and the Indo-Afghan political frontier. The British troops, the Gurkhas, the Pathan *limitanei* in the North-West Frontier militias, and the Indian troops maintained by the client states were organized in separate units,

¹ See IV. iv. 76.

² See IV. iv. 76-78 and V. v. 299-302.

³ For the Westernization of Turkey and the part played in the process by the new Western-model Ottoman Army, see further IX. viii. 234-9.

⁵ In the Spanish Indies there was, of course, a considerable Creole population of Spanish blood, descended from the *conquistadores*, and both there and in British India there was a half-caste population (the *mestizos* and the 'Eurasians', latterly renamed 'Anglo-Indians'). But in both empires power and responsibility remained in the hands of thoroughbred West Europeans born and brought up in the European countries of which these two universal states were political dependencies.

² See V. v. 297-9.

each of which was homogeneous in its personnel;¹ the Hindu and Muslim British Indian troops and the Pathans in the mobile regular army (as distinct from sedentary Pathan militiamen) all served together in the same regiments, though not usually in the same companies or squadrons. From A.D. 1849 onwards, when the British Rāj took over the North-West Frontier of the Panjab from the Sikhs and thereby established direct contact with the Pathans, there was a tendency for the ratio of soldiers of transfrontier barbarian origin in the British Indian Army to increase;² but down to A.D. 1947, when the British authorities withdrew the last British troops from India and handed over the former British Indian Army to the governments of the Indian Union and Pakistan, this increase in the relative numerical strength of the barbarian contingent in the armed forces of the Rāj had not seemed to be preparing the way for an eventual barbarian domination over India such as had threatened to overtake the Ottoman Empire and had actually overtaken the 'Abbasid Caliphate and 'the New Empire' of Egypt.

If in British India this danger had been successfully kept at arm's length, the success may have been due to a combination of causes which were all bound up with the special character of the British Rāj. There were no Gurkha or Pathan units in the British Indian Army that were furnished to the British authorities *en bloc*, under national or tribal commanders of their own, by the Gurkha states or the Pathan tribes themselves. The only units that were permitted that degree of corporate individuality and autonomy were the contingents furnished by the Indian client princes, of whose loyalty the British Indian authorities were sure. The Gurkha and Pathan soldiers enrolled in units of the British Indian Army were recruited, not corporately, but individually, and were commanded, not by leaders drawn from their own community, but by British officers. A further safeguard was that the British troops in India, consisting, as they did, exclusively of soldiers born and bred in the United Kingdom, and being segregated, as they were, from their Indian, Pathan, and Gurkha comrades-in-arms in self-contained units of their own, retained their pristine martial qualities from one generation to another—in contrast to their immediate predecessors the Mughals and other earlier alien empire-builders in India, who, by making India their home and by intermarrying with the native inhabitants, had merged themselves in the mighty mass of the Indian people and, in thus losing their alien identity, had forfeited their ascendancy over their Indian subjects. In A.D. 1952, when these former British counterweights to the menace of a barbarian preponderance in a now divided Indian Army had all been removed, the outlook was still obscure, but it was

¹ After A.D. 1858, when the British Crown took over the administration of British India from the British East India Company, there were no units of British troops in India that were not part of the Royal Army of the United Kingdom. Under the Company's régime the Company had maintained an army of its own which had included British as well as Indian units. The Gurkha and British Indian regular units and the Pathan militias were under British command and had a complement of British officers—though they also had non-British commissioned officers of special grades. The forces maintained by the Indian client states were officered by Indians but were uniform with the British Indian Army in their training and equipment.

² See II. ii. 128, n. 1.

evident that the Pathans had a brighter prospect of capturing the army of Pakistan, and the Gurkhas of capturing the army of Hindu India, than either of these two barbarian peoples—martial though both of them were—had ever had of capturing the army of the British Rāj.

The success of the British Rāj in India in employing with political impunity the military services of barbarians beyond its pale, as well as those of its own Indian subjects, was emulated by the Manchu restorers of a Far Eastern universal state in China. As we have noticed in another context,¹ Chinese and Mongol battalions were brigaded with Manchu battalions in varying numbers and ratios in the Manchu Power's army corps known as 'banners'. Even when the Manchu Government's domain was still confined to territories lying outside the Great Wall, the Chinese members of the community outnumbered the Manchus and Mongols;² and, after their passage of the Wall in A.D. 1644, it was the South Manchurian Chinese contingent in the banners that gave the invaders the man-power requisite for completing the conquest of Intra-mural China. While the Manchus thus succeeded in enlisting Chinese to help them win and hold China for a Manchu régime, they were no less successful in dealing with the equally delicate problem presented by the Mongols, martial barbarians with memories of a great imperial past of their own and with a tincture of alien culture³ that made them no less difficult to assimilate than the intensely cultivated Chinese.

The Manchus attacked their Mongol problem from two directions. On the one hand, in the organization of the Mongol battalions of the banners they anticipated the policy of the British military authorities towards the Gurkhas and Pathans by recruiting their Mongol soldiers individually, and not in tribal *blocs*, and by placing them under the command of Manchu officers. On the other hand, they handled the Mongol tribes on the Steppe as the 'Osmanlis had handled the Kurdish tribes in the Zagros Mountains. Without attempting to destroy their tribal organization, they contented themselves with dividing the tribes up into tribal atoms of a minimum size, and with imposing a strict delimitation of the boundaries between their respective pastoral ranges. The Mongol tribes, thus reduced in size and penned within fixed limits, were allowed to remain autonomous under the rule of their own tribal chiefs, while, to save appearances, these Mongol tribal chieftainships were nominally given the status of 'banners', as the Kurdish tribal chieftainships had been officially classified as Ottoman fiefs in the books of the Pādishāh.⁴ The political success of this Manchu military organization is attested by the fact that, when the Manchu régime in China was liquidated in A.D. 1911, the revolution was not the work of the Manchus' comrades-in-arms in the Chinese and Mongol battalions of the banners.

The success of the Manchus in China and the British in India in

⁴ See Michael, op. cit., pp. 96-97. It will be seen that, in post-Didacletianic Roman terminology, these Mongol and Kurdish tribes were *foederati* of the Manchu and the Ottoman Empire respectively.

employing the professional military services of barbarians with political impunity was eclipsed by the Carthaginian architects of a colonial Syriac universal state in the area opened up by Phoenician maritime enterprise in the western basin of the Mediterranean. Though the citizens of Carthage never exempted themselves entirely from serving personally in the field, they did not hesitate, in the heyday of their wealth and power, to enrol Libyans and Iberians—and these not only from among their own subjects, but also from among the untamed barbarians beyond their pale—on a scale which quite dwarfed the Carthaginians' own citizen force. This, on the face of it, perilous policy did, sure enough, bring the Carthaginian Empire, and Carthage herself, to the verge of destruction when, at an hour in which Carthage's prestige was at a low ebb owing to her defeat in the First Romano-Punic War (*gerebatur* 264–241 B.C.), the Carthaginian Government imprudently, though characteristically, exasperated their mercenaries by proposing to interpret their agreed terms of service on lines so niggardly as, in the mercenaries' view, to create a breach of contract. Yet Carthage did succeed in quelling the Great Mutiny of 240–237 B.C.; and this discreditable incident in her military annals apparently did so little permanent damage to her mercenary army's discipline and *moral* that in the next generation the successors of the discomfited mutineers, when led by a captain of genius who inspired them with a personal devotion to himself, all but succeeded in inflicting on Rome the fate that Carthage herself was eventually to suffer at Roman hands.¹

The Consequences of the Enlistment of Barbarians in the post-Diocletianic Roman Army

The problem which was solved by the Carthaginians in the Western Mediterranean, by the Manchus in China, and by the British in India, but which defeated the Ramsids and the 'Abbasids, overtook the Roman Empire likewise in its post-Diocletianic age.

Though, in all ages, able-bodied adult Roman citizens were legally liable to be called up compulsorily for military service, the standing army of the Principate had in fact been recruited by voluntary enlistment; for, though service in the Army was confined to Roman citizens for the legions and to free Roman subjects for the *auxilia*, to the exclusion of both slaves and aliens, the strength of the Army in that age was a very low percentage of the total man-power available in the two eligible categories. This easy state of affairs was brought to an end once for all by Diocletian's military reforms, involving, as they did, an increase in the strength of the Army by perhaps as much as two-thirds, from about 300,000 men to about 500,000.² From that time onwards there was perpetual difficulty in finding suitable recruits in sufficient numbers.³

The civil authorities, whose responsibility it was to produce the men

¹ See V. v. 465–6.

² See p. 323, n. 5, above.

³ Vegetius complains (probably with reference to conditions in the western provinces of the Empire in the fifth century of the Christian Era) of the difficulty of filling the cadres—especially in the legions, to which the *auxilia* were preferred by recruits (see Vegetius, Book I, chap. 5, and Book II, chap. 3, quoted by Grosse, *op. cit.*, p. 266).

for their military colleagues,¹ dealt with the Roman citizen-body—which, since the *Constitutio Antoniniana* of A.D. 212, embraced nearly the whole of the native-born free population of the Empire²—by sifting it, for military purposes, into different categories which received differential treatment ranging between the two extremes of compulsion to serve and prohibition to enlist.³ In the conscription of agricultural serfs, which was by far the largest reservoir of citizen man-power at the recruiting authorities' disposal, there were elaborate arrangements—unfortunately frustrated to a large extent by fraud, bribery, and pressure—for distributing the burden equitably between province and province and between estate and estate.⁴ Conscribed serfs, however, were naturally apt to be of poor martial quality, even if they had been forthcoming in sufficient numbers to cover Diocletian's formidable increase in the Army's strength, and the recruiting authorities therefore looked for an additional source of supply. The ban on the enlistment of slaves was not lifted, and it was still in force in Justinian's day (*imperabat* A.D. 527–65).⁵ From Diocletian's reign (*imperabat* A.D. 284–305) onwards, however, all barriers to the recruitment of aliens were removed,⁶ and barbarian alien recruits were now the more highly esteemed the more barbarous they were.⁷

For Roman military purposes an unreclaimed barbarian had the double attraction of bringing with him a native martial tradition and of being a volunteer who had not had the edge taken off his zest for military service through being pressed into it,⁸ as were the majority of the post-Diocletianic recruits of Roman origin.⁹ Even barbarian prisoners-of-war, if distinguished by rank or prowess in their native social environment, were able to bargain with the Roman recruiting authorities, as a condition of enlistment in the Roman Army, that they should start their career as officers;¹⁰ and the number of high officers of barbarian origin in the post-Diocletianic Roman Army indicates either that this privilege of a flying start was frequently secured by barbarian recruits or else that high promotion was frequently earned by men who

¹ See Grosse, R.: *Römische Militärgeschichte von Gallienus bis zum Beginn der Byzantinischen Themenverfassung* (Berlin 1920, Weidman), p. 158. We may conjecture that this task was assigned to the civil authorities in the post-Diocletianic Roman Empire for the reason that led the Government of the United Kingdom, during the World War of A.D. 1939–45, to assign it to the Ministry of Labour and National Service. Whereas the military authorities were bound to think of their own needs first, the civil authorities might be expected to look at the problem of man-power as a whole, and to do their best to keep the Army up to strength with the least possible detriment to civilian services, such as the production of foodstuffs and the manning of the merchant marine, which, on a comprehensive view, might be seen to be not less essential than military defence itself for the welfare, or even for the survival, of the community.

³ See Grosse, op. cit., pp. 202 and 204–6.

⁴ See *ibid.*, pp. 210–15.

⁵ See *ibid.*, p. 198.

⁷ See *ibid.*, pp. 200–1.

⁶ See *ibid.*, p. 200.

⁸ See *ibid.*, pp. 201–2.

⁹ A majority, but not all; for, as late as the sixth century of the Christian Era, in what remained of the Illyrian provinces of the Empire, there was a native Latin-speaking rural population of Roman citizens in which an historic local martial tradition was still sufficiently alive to inspire two Dardanian peasants—the future Emperor Justin I and his brother—to seek their fortunes by coming to Constantinople to enlist (see Grosse, op. cit., p. 203).

¹⁰ See *ibid.*, p. 203.

started as privates.¹ Conversely, the citizen recruit came to be rated so low that in A.D. 440, at a date when, in the West, the Empire was at its last gasp, Roman citizens were freed from all military obligations save for taking part in the manning of city-walls in an emergency.²

The increasingly numerous and important barbarian intake into the post-Diocletianic Roman Army was recruited and organized on two systems, each of which had its own disadvantages and dangers. Besides the barbarian soldiers who enlisted individually in Roman military formations, there were national units, commanded by officers of their own nationality, that were furnished to the Roman Army by autonomous barbarian communities with the status of *foederati*.³ On the face of it, the system of individual enlistment might seem the less hazardous of the two—the more so, in view of the success of the Manchus in China and the British in India in keeping in order the barbarian soldiers whom they enrolled in this way. If the Romans ran into disaster where the British and the Manchus steered clear of it, the explanation of this difference in the outcome perhaps lies in a difference in the extent to which the dilution of regular units with barbarian personnel was carried; and, if, in this delicate matter, the Roman military authorities trespassed beyond the margin of safety, the culprit is to be found in the Emperor Theodosius I (*imperabat* A.D. 378–95).⁴ Theodosius tipped the hazardous balance in the post-Diocletianic Roman Army in the barbarians' favour.⁵ He drafted them into the Roman regular formations in a ratio so high as to produce a break in the Roman military tradition and discipline.⁶ The disastrous consequences are reflected in Vegetius's picture⁷ of the Army going to pieces. The troops can no longer be induced to submit to training,⁸ drill,⁹ or assaults at arms;¹⁰ they are unwilling to carry burdens;¹¹ they are slack in the performance of their military duty in general;¹² and they are unwilling to undertake the hard labour of fortifying camps.¹³ 'The Roman Army had ceased to exist. It had never succumbed to the Germans; it had simply been supplanted by them.'¹⁴

The Roman Army, and consequently the Roman Empire itself, was thus confronted, by Theodosius's ill-judged abandonment of all restrictions on the admission of barbarian recruits, with the imminent threat of a barbarian ascendancy. This doom was not accepted by the Roman

¹ See *ibid.*, p. 196.

² See *ibid.*, p. 202.

³ Strictly, *foederati dediticii* (see Grosse, *op. cit.*, p. 206), presumably because, since the *Constitutio Antoniniana*, *dediticii* were the only category of inhabitants of the Roman Empire who did not possess the Roman franchise.

⁴ See Grosse, *op. cit.*, p. 262, n. 2.

⁵ See Zosimus: Book IV, chaps. xxx and xxxi, cited by Grosse, *op. cit.*, p. 260.

⁶ The effect, according to Zosimus, chap. xxxi, §§ 1–2, was a dissolution of military discipline and a breakdown of the system of registering effectives—with the result that the professed 'deserters' from barbarian tribes beyond the Roman imperial *limes* who had been registered as serving soldiers in the Roman regular army took to going home, sending substitutes to fill their places, and falling into the ranks again whenever it took their fancy.

⁷ Cited as evidence by Grosse, *op. cit.*, p. 261.

element in the Army without a struggle; but, while the Roman reaction was ubiquitous, the results were quite different in different sections of the Empire. In the East and Centre the untoward effects of Theodosius's error were reversed in the nick of time, while in the West the vantage surrendered by him to the barbarians was not, in the end, retrieved.

In the East the coming conflict was heralded, before Theodosius's death, by a clash at Philadelphia between Egyptian and barbarian troops which was provoked by the barbarians' intolerable treatment of the civilian population and in which the barbarians suffered more than two hundred casualties;¹ but the crucial trial of strength in the East—in which the utter discomfiture of the barbarians made history by producing a permanent parting of the ways between the fortunes of the eastern and western sections of the Empire²—came in A.D. 400. In the East in that year there was a general civil war between the Roman and barbarian soldiery in which 35,000 Gothic troops were wiped out;³ and the victors confirmed and enhanced the effects of their signal triumph by taking advantage of the breathing-space that they had thereby won for themselves in order to introduce effective measures for precluding, in the East, a recurrence of the barbarian peril. In the East the imperial authorities had the courage thenceforward to dispense with a barbarian instrument whose dangerousness had proved greater than its value. Almost all the surviving names of military officers in the East in the records of the next fifteen years are Graeco-Roman;⁴ and, though this resolute purge of barbarian military man-power may have had adverse short-term military effects, its long-term political result was that the Empire managed, in the East, to stave off for two centuries longer the final catastrophe that now swiftly descended upon the West.⁵

Before the close of the fifth century of the Christian Era the East had tapped a native source of martial man-power by making serviceable Roman soldiers out of the wild highlanders of the Taurus;⁶ and these Isaurian troops showed themselves a match for the barbarians from beyond the pale in the Great Romano-Gothic War of A.D. 537-53.⁷ At the same time the Roman military authorities in the East continued to draw recruits from the general population, even in the least warlike of the eastern provinces. In the documents preserved on Egyptian papyri dating from the sixth and seventh centuries, none of the soldiers there mentioned bear barbarian names,⁸ and, according to a Modern Western scholar who was an eminent authority on the subject, the first mention of *foederati* serving in Egypt was to be found in the chronicle of John of Nikiû, who lived to record the Arab conquest.⁹ By that time

¹ See Zosimus: Book IV, chap. xxx, §§ 4-8, cited by Grosse, op. cit., p. 263.

² The historic importance of this event has been pointed out already in IV. iv. 324.

³ See Grosse, op. cit., p. 264.

⁴ See *ibid.*

⁵ See *ibid.*, pp. 264-5.

⁶ See IV. iv. 324-5.

⁷ In the Modern Western World the Government of the United Kingdom pursued the same policy with similar success when it enrolled the wild highlanders of Scotland in the British Army after their last outbreak in A.D. 1745.

⁸ See Grosse, op. cit., p. 277.

⁹ The authority for this statement is Grosse, op. cit., p. 281, but the page (p. 531) of Zotenburg's edition of the chronicle of John of Nikiû which he cites as his reference does not exist in Zotenburg's definitive edition: *Chronique de Jean, Evêque de Nikiou*, texte éthiopien publié et traduit par H. Zotenberg (Paris 1883, Imprimerie Nationale),

the *foederati* in the East had been transformed from national contingents furnished by autonomous barbarian communities under native commanders into units of the Roman regular army which were, indeed, still barbarian in their personnel but were of mixed nationality and were under the command of Roman officers.¹ These sixth-century barbarian regulars to whom the name *foederati* now attached were a mobile cavalry force which was the cream of Justinian's army.² In fact, by Justinian's day the Roman Army of the East had learnt the secret of how to employ barbarian troops with military profit³ without political risk. The only non-Romans whom Justinian enrolled were prisoners-of-war⁴ or deserters.⁵ His barbarian troops were relatively few in numbers, but it was they who won his victories for him.⁶

This Roman military recovery in the East was not reproduced in the West. The anti-barbarian reaction that had started in Constantinople in A.D. 400 did indeed have repercussions on the farther side of the Adriatic. It made its influence felt in the assassination of the Vandal generalissimo Stilicho in A.D. 408 and in the ineptly brutal accompanying massacre of the families of barbarian soldiers, domiciled in Italy, by Roman troops.⁷ Moreover, for the next half-century the perilously dictatorial western military office of generalissimo (*magister peditum in praesenti*)⁸ was held by five successive incumbents, from Constantius to

and the reference is presumably to the preliminary edition published in the *Journal Asiatique* in 1879. In the French translation accompanying the definitive edition, it is mentioned (p. 421, chap. cvii) that, when Heraclius in Africa revolted against Phocas, he raised mercenary troops from the barbarians of Tripolitania and Pentapolis and that a strong contingent of these was included in the expeditionary force which marched on Egypt under the command of Nicetas. These barbarian mercenaries are mentioned subsequently on three occasions in the chronicler's account of the ensuing military operations in Egypt (pp. 426-7, chap. cvii; p. 428, chap. cviii; p. 431, chap. cix). Again, in the account of the military operations arising out of the invasion of Egypt by the Arabs, there is a reference to 'toutes les troupes d'Égypte et les troupes auxiliaires' (p. 434, chap. cix). If these are the passages that Grosse has in mind, he is presumably taking it for granted that Nicetas' 'barbarians' and Theodore's 'auxiliaries' were *foederati* in the then current technical meaning of the term.

¹ See Grosse, op. cit., pp. 280-1.

² Ibid., pp. 282-3.

³ One index of the re-establishment of discipline in the Roman Army of the East, after the *dégringolade* following the dilution of the Army with barbarians in the reign of Theodosius I, may be found in the survival, in Justinian's day, of the laborious practice of fortifying camps (as described by the 'Anonymus Köchly', chaps. 26-29 (Köchly, H., and Rüstow, W.: *Griechische Kriegsschriftsteller*, Zweiter Theil, Zweite Abtheilung, pp. 136-47) cited by Grosse, op. cit., p. 302). As Grosse points out (op. cit., pp. 305-6), this survival of the tradition of camp-making in the Roman Army of the sixth century of the Christian Era is the more noteworthy considering that camp-making was an infantry technique, whereas by this time the principal arm of the Roman Army had long since come to be the cavalry.

⁴ e.g. Vandals.

⁵ See Grosse, op. cit., pp. 277-8.

⁶ See *ibid.*, pp. 279-80.

⁷ See Zosimus: Book V, chap. xxxv, §§ 7-8, cited by Grosse, op. cit., p. 265.

⁸ The *magistri militum* of the post-Diocletianic Empire were the commanders of the mobile army (the *Comitatenses*) that Diocletian had called into being. Since the *Comitatenses* were divided into an infantry and a cavalry arm, there was originally a pair of *magistri*—a *magister peditum* and a *magister equitum*—attached to the Emperor, or one pair to each of the emperors at times when the imperial office was in commission. In this college of commanders-in-chief the *magister peditum* ranked senior to his colleague commanding the cavalry (see Grosse, op. cit., p. 183). When an Empire that had been re-united in the hands of Theodosius I was divided again, upon his death, between his sons Arcadius and Honorius, the *magister peditum* at the imperial headquarters (*in praesenti*) in the West came to overshadow his junior colleague the *magister equitum in praesenti* so completely as to become virtually a permanent military dictator within the western emperor's domain (see *ibid.*, pp. 188-9)—a situation which was recognized in

Aëtius inclusive,¹ who were Roman in nationality. When, however, with the accession of Ricimer to the generalissimate in A.D. 456, an army which in the West was still overwhelmingly barbarian in its personnel² found itself once more under the supreme command of an all-powerful barbarian war-lord, the fate of the Empire in the West was sealed,³ and Ricimer's death in A.D. 472 could not prevent his fellow barbarian Odovacer from taking his place and completing his work by making appearances in the West more nearly conform with realities.⁴

The Roman Army's Legacy to the Christian Church

If we now ask ourselves who had been the beneficiaries of the institution of mobile standing armies in universal states, we can answer at once that these military corporations had been apt to make the fortunes of

the practice that grew up of investing him, almost *ex officio*, with the title of *patricius* (see Grosse, *op. cit.*, p. 182).

'This dominance of the office of imperial generalissimo was one of the principal factors in the fall of the West Roman Empire; the German *magister militum* eventually supplanted the Emperor. Ricimer laid the foundations of the German supremacy in Italy and thereby prepared the way for Odovacer's usurpation. Theodorici, in the next chapter of history, was, from the Roman standpoint, simply the East Roman Emperor's *magister militum utriusque militiae* [i.e. area commander, in Italy, of both arms of the mobile branch of the Roman Imperial Army]'—(*ibid.*, p. 190).

This development, which worked itself out in the West with such fatal consequences for the Empire, was avoided in the East thanks to precautions taken there by Theodosius I to prevent the concentration of military authority in a single pair of hands. In the first place the two *magistri praesentales* at Constantinople were given equal and coordinate rank with one another, and the command of the mobile troops of both arms at the eastern imperial headquarters was divided equally between them. In the second place, under the co-ordinate commandership-in-chief of the two eastern *praesentales*, the army groups of *Comitatenses* stationed in the eastern and central provinces were divided between three different area commands—per Orientem, per Thraciam, per Illyricum—under the regional command of three subordinate *magistri equitum* who were styled *magistri utriusque militiae* because they were in command of the infantry as well as the cavalry units of the mobile army within their respective areas (see *ibid.*, pp. 185–6). Since the area command per Orientem was still dangerously large, Justinian reduced its size by carving out of it a fourth eastern area command per Armeniam (see *ibid.*, p. 190). This institution of subordinate area commands *utriusque militiae* was not confined to the East. In the West there was, for example, an area command per Gallias. In the West, however, this decentralization did not avail to curb the power of the senior *magister militum praesentalis*.

Though Zosimus lived to see the western provinces of the Roman Empire overtaken by a disaster from which the central and eastern provinces were saved by Theodosius's precautions, the pagan historian professes (in Book IV, chap. xxvii, §§ 3–5) to see no more in the Christian Emperor's statesmanlike division of commands than a wantonly extravagant inflation of the imperial budget for military salaries.

¹ For the career and the significance of Aëtius, see V. v. 471–2.

² See the rhetorical, yet nevertheless revealing, catalogue, given by Sidonius Apollinaris (*Carmen* V, ll. 474–9), of the barbarian peoples represented in the army with which the unhappy emperor Majorian crossed the Alps from Italy into Gaul in A.D. 458.

³ There were, of course, other, and perhaps more potent, causes of the dissolution of the Roman Empire in the West at this juncture. One underlying cause, from which all the rest derive in some measure, was the general social and economic backwardness and feebleness of the western provinces by comparison with those of the Centre and the East. One symptom of this was an unhealthy concentration of such wealth as there was in the West in the hands of great rural landowners who in the fifth century of the Christian Era virtually escaped the control of the imperial authorities and, in particular, defied the efforts of the inland revenue authorities to collect from them the taxes which they alone had the means to pay. (On this point see Grosse, *op. cit.*, p. 269.)

⁴ The conformity achieved was far from being complete, for, though Odovacer did depose the puppet-emperor Romulus Augustulus in whose name he had been ruling Italy, he did not venture to assume authority in his own name by naked right of his *de facto* power, but sought and obtained investiture as the vicegerent, in Italy, of the Imperial Government at Constantinople.

the aliens or barbarians who had been enrolled in them. The latter-day Achaemenids' recruitment of a mobile professional force of Greek mercenaries led to the conquest of the Achaemenian Empire by Alexander and its partition between a number of Macedonian Greek successor-states. The enrolment of barbarians in the bodyguard of the 'Abbasid Caliphs and in the standing armies of the Roman Empire and 'the New Empire' of Egypt led to the establishment of barbarian rule in the dominions of the Caliphate, in the Egyptian World, and in the western provinces of the Roman Empire. We can also espy cases in which the beneficiary had been an alien secular culture. The Hellenic culture made its entry into the Hittite, Syriac, Egyptian, Babylonian, and Indic worlds at the heels of the Macedonian *conquistadores*. The creation of a new army on a Western model in the Russian Empire by Peter the Great, and in the Ottoman Empire by Selim III and Mahmud II, led to the progressive Westernization of other sides of Russian and Ottoman life.¹ The enrolment of Italian, Flemish, and West German troops in the Napoleonic army expedited the re-absorption of the debris of a city-state cosmos in Northern Italy, Western Germany, and Flanders, which had differentiated itself from the rest of Western Christendom in the medieval age of Western history,² into a Modern Western body social represented by contemporary French society. It is more surprising to see the mantle of an army descending upon the shoulders of a church—and the more so when the recipient of this military inspiration is a church with an anti-military tradition and *éthos*.

In their conscientious objection to the shedding of blood, and consequently to the performance of military service, the Primitive Christians were at variance with both the Jewish and the Roman tradition.

'In the last resort, the Jew literally drew the sword and forestalled the Messiah. . . . The Christian, on the other hand, was instructed to await the coming of his victorious Christ.'³

In striking contrast to the series of Jewish insurrections against first Seleucid and then Roman rule during the three hundred years running from 166 B.C. to A.D. 135,⁴ the Christians never once rose in armed revolt against their Roman persecutors during the approximately equal period of time that elapsed between the beginning of Jesus' mission and the conclusion of peace and alliance between the Roman Imperial Government and the Church in A.D. 313.⁵ As for service in the Roman Army, this was a stumbling-block for Christians because it involved not only the shedding of blood on active service but also, among other things, the passing and execution of death sentences, the taking of a military oath of unconditional loyalty to the Emperor, the worship of the Emperor's genius and offer of sacrifice to it, and the veneration of military standards as idols.⁶ Service in the Army was, in fact, expressly

¹ The penetration of an alien culture through a military door is examined further in IX. viii. 126–53.

⁶ See *ibid.*, p. 46.

declared to be unlawful for Christians by successive Early Christian Fathers—by Origen,¹ by Tertullian,² and even by Lactantius in a work published after the conclusion of the Constantinian peace between the Christian Church and the Roman State.³ In his downright assertion—‘We do not march with the Emperor, not even if he presses us’—Origen retrospectively justified Celsus’s complaint (of which the record has been preserved by Origen himself) that the Christians refuse to perform military service.⁴

It is significant that this ostracism of the Roman Army by the Christian Church broke down, and this through developments in the position and outlook of the Christian community at a time when the Army of the Principate was still being recruited by voluntary enlistment—indeed, more than a hundred years before the issue was raised on the Roman Government’s side through the reintroduction of compulsory military service as a corollary to the expansion of the Army by Diocletian.

Down to about the year A.D. 170, occasions for conflict over this issue were, it would seem, avoided; for down to that time Christian civilians apparently abstained as a matter of course from enlisting in the Army, while, if a pagan serving soldier became a convert, the Church tacitly acquiesced not only in his serving out his term with the colours but in his continuing to perform all acts that the Army expected of him, including those requirements that deterred Christians from enlisting. Possibly the Church justified to herself this laxity on a question of principle on the same ground on which, in this first chapter of her history, she tolerated other social anomalies or enormities in her bosom, such as the continuance of the institution of slavery even when master and slave alike were members of the Christian community. In the Church’s expectation in this age, the time remaining before Christ’s Second Coming was so short that the Christian soldier-convert might just as well pass it under arms as the Christian slave-convert in bondage.⁵

‘The incompatibility [of Christian principles] with the State, the social order, public life and the like, first impinged upon the Christians’ conscience in its full force when the Christians began to suspect and to recognise that they were going still to have to do with these affairs for quite a long time to come, and were also going to incur their share of responsibility for them.’⁶

In the third century of the Christian Era, when the Christians did begin to make their way in rapidly increasing numbers into the politically responsible classes of Roman society—partly by themselves rising in the world, and partly by winning upper-class converts—they answered in practice the question raised for them by the social impor-

⁶ Harnack, op. cit., pp. 50–51. Compare p. 69.

tance of the Roman Army without ever solving it in theory and without waiting for the conversion of the State of which this army was an organ. In Diocletian's army the Christian contingent was already so large, so conspicuous, and so influential that the persecution launched in A.D. 303 was directed against Christianity in the Army in the first instance.¹ The Army was, in fact, the testing ground of the issue between the Imperial Government and the Church.² The strength of the Christians in the Army even in the West, where at the opening of the fourth century the percentage of Christians in the population was very much lower than in the contemporary East, is indicated by Constantine's manifesto in the Church's favour in A.D. 312, on the eve of the critical battle at the Milvian Bridge.³ The future pioneer of Christian monachism, the Egyptian Pachomius, was converted to Christianity as a soldier in the expeditionary force with which Constantine was then marching against Maxentius.⁴ The completeness of the eventual identification of Church and Army in an age when the names 'Christian' and 'Roman' had become virtually synonymous is symbolized in the record that, when, in the fifth century, the flood of barbarian invasion finally engulfed the Upper Danubian *limes*, and the last unit of local *limitanei* dissolved, their commanding officer found alternative service as a bishop.⁵

Still more significant than this breakdown of the Christian Church's original boycott of the Roman Army is the influence of the Army on the Church in the age in which the ban was still in force.

' "War" is one of the fundamental forms of Life, and there are inalienable virtues that find their highest, or at any rate their symbolic, expression in the warrior. . . . Accordingly, no higher religion can do without imagery derived from war, or, in consequence, do without "warriors" [of its own].'⁶

In the Jewish tradition, which the Christian Church had retained as a treasured part of its own heritage when it had parted company with Judaism, war was consecrated both in the literal sense as an indispensable means of realizing the messianic hope and in a symbolic sense in the metaphorical language of the authors of the Books of the Prophets and the Psalms;⁷ and, though the Church dropped the literal application, she retained the symbol.⁸ While, however, the Jewish martial tradition was thus a potent literary influence on the life of the Primitive Christian Church, the Roman martial tradition presented itself to Christians as a living and impressive reality. Baneful and hateful though the Roman Army of the Republic had been to the population of the Hellenic World in the cruel age of the Roman conquests and the still more cruel age of the ensuing Roman civil wars, the Roman Army of the Principate, which lived on its pay instead of lining its pockets by looting,

⁶ Harnack, *op. cit.*, p. 2.

⁷ See *ibid.*, pp. 8-9.

⁸ This abandonment, by the Christian Church, of Jewry's literal militancy was perhaps originally sub-conscious, or at any rate tacit. Origen, however, frankly admitted a change of principle, on this point, as between the New Testament dispensation and the Old (see Harnack, *op. cit.*, pp. 26-27 and 72).

and which was stationed on the frontiers, to defend Civilization against the barbarians, instead of infesting and devastating the civilized interior, came to win the involuntary respect, admiration, and even affection of Rome's subjects, as an oecumenical institution that ministered to their welfare and that was a legitimate object for their pride.

'Let us observe', wrote Clement of Rome, about the year A.D. 95, in his First Epistle to the Corinthians,¹ 'the conduct of the soldiers who serve our rulers. Think of the orderliness, the pliancy, the submissiveness with which they carry out their orders. Not all of them are legates or tribunes or centurions or options or officers of the grades below these. But each serving soldier in his own unit carries out the commands of the Emperor and the Government.'

In thus commending the discipline of the contemporary Roman Army as an exemplar for his Christian correspondents, Clement was seeking to establish a rule of organization for the Church. Obedience, he was saying, is due from Christians, not only to God, but to their ecclesiastical superiors. 'All Christians are soldiers; but, just for that reason, they have to obey their leaders the presbyters.'² This equation of 'soldier of God' with 'member of the Church' would have seemed a matter of course to Mithraists; for, of the seven grades of initiation in the Mithraic Church, the third from the bottom was *miles*, and it is probable that most initiates never rose higher than that level.³ In the evolution of the Christian Church's military imagery, however, the original equation of 'soldier' had been not with 'convert' but with 'missionary'; and from this equation its author, Saint Paul, had drawn two inferences: the missionary must disencumber himself from the impedimenta of civilian life, and the missionary has the same claim to be supported by his flock as the soldier has to receive his pay out of the contributions of the tax-payer.⁴

'The two military axioms that were adopted by the Christian community in its earliest phase—that the Christian missionary and teacher should receive his maintenance from others, and that on the other hand he should not entangle himself in civilian business life—are in a relation of polarity to one another and just on that account already contain in themselves the germs of a whole hierarchical system.'⁵

Yet, whatever influence the Roman Army may have had on the development of the Church's institutions, the Church owed more in that sphere to the influence of the Roman civil service,⁶ and the Army's example produced its principal effect on the life of the Church in the more elusive but more intimate realm of ideas and ideals. The Roman military imagery that was introduced into the Christian Church's terminology by Saint Paul, and that was adopted and developed by Clement of Rome, was extended by Saint Ignatius, whose letters, written early in the second century of the Christian Era in Greek, bristle

with transliterated Latin military technical terms.¹ Tertullian (*vivebat circa* A.D. 155–222), who was the son of an army officer, worked out the simile of the *militia Christi* consistently and thoroughly,² and in this he was followed up by his North-West African compatriot Saint Cyprian.³

The Christian initiation-rite of baptism is equated by Cyprian with the military oath (*sacramentum*) required of the recruit upon his enrolment in the Roman Army.⁴ Once enrolled, the Christian soldier must wage his warfare 'in accordance with the regulations' (*νομίμως*).⁵ He must eschew the unpardonable offence of desertion,⁶ and likewise the grave misdemeanour of dereliction of duty.⁷ 'The pay of delinquency is death', as Tertullian translates the phrase in Saint Paul's Epistle to the Romans⁸ which appears as 'the wages of sin' in the Authorized English Version of the Bible. The ritual and moral obligations of the Christian life are equated by Tertullian with military fatigues. In his terminology a fast is a stint of sentry-go (*statio*),⁹ and the Christian duty which is declared in the Gospel according to Saint Matthew to be so well within the compass of human powers is 'the Lord's light pack' (*levem sarcinam Domini*).¹⁰ Moreover, the Christian soldier's faithful performance of his duty is duly recompensed. If 'the pay of sin is death', it must be reckoned on the other side of the account between the spiritual soldier and his heavenly paymaster that 'God's gratuity is life' (*donativum autem Dei vita*).¹¹ And, short of receiving a gratuity, the soldier can look forward to drawing his rations so long as he gives satisfaction to the master with whom he has taken service.¹² 'Your deposits [of deferred pay] are your works, [and you bank them] in order that you may [eventually] draw your receipts on an appropriate scale.'¹³ The Cross is a military standard (*σύσσημον*) which Jesus has raised to inspire his troops.¹⁴ The Christian soldier's general (*imperator*) is Christ,¹⁵ and the soldier must never forget that he is under his general's eye.¹⁶ Thus inspired, led, and disciplined, Christ's army can challenge comparison with Caesar's. If Christians are civilians (*pagani*) from the standpoint of Caesar's army, so are Caesar's

soldiers from the standpoint of Christ's.¹ Justin Martyr (*florebat circa* A.D. 150) goes so far as to claim that the Christians' devotion to their service is greater than the Army's is to theirs.²

With a great Modern Western scholar's aid, enough evidence has now been cited to show that the Roman Army's impress on the Christian Church had cut deep. The mark that it had made had been enduring; and, in virtue of it, a mundane military organization which had finally lost its own identity in wars to the death with Persian and Arab adversaries in the seventh century of the Christian Era was still a living force in the World in A.D. 1952.

2. Civil Services

The Difficulty of Creating a Professional Civil Service

The variety which our survey of imperial standing armies has brought to light in the degree of development of the institutional organization of the universal states in our catalogue makes itself apparent again when we pass to the consideration of imperial civil services.

These vary, in degree of development, between two extremes illustrated by the Achaemenian Empire at the lower end of the scale and by the Ottoman Empire at the upper end. The Achaemenian professional civil service always remained rudimentary. Its most important representatives were the imperial secretaries who were resident at the headquarters of the provincial governors but were independent of the satraps and reported directly to the Central Government. As a further check, the satraps were also kept under observation by itinerant inspectors, expressively nicknamed 'the Emperor's eyes'.³ The need for a central authority to gather together, hold, and manipulate these widely ramifying threads of administrative control seems to have been met, in the organization of the Imperial Court, by the evolution of an officer who was known in Old Persian as 'the Hazarapatiš' and in Greek as 'the Chiliarch', because he had begun by being simply the commander of an inner imperial bodyguard of one thousand men, into an Imperial Chancellor or Minister of State performing some, at any rate, of the functions that, in the Roman Empire, through a parallel process of evolution, came to be performed by the commandant of the Emperor's praetorian guards (*praefectus praetorio*).⁴ While the Achae-

¹ Tertullian: *De Coronâ*, *passim*, cited by Harnack, *op. cit.*, pp. 68-9, who points out that *paganus* is likewise used in the sense of 'civilian' in *Digest*, XLIX. xix. 14.

² See Harnack, *op. cit.*, p. 21.

³ The Achaemenian network of imperial communications, which made this system of inspection a practical possibility, has been noticed on p. 82, above.

⁴ See p. 182, n. 3, and p. 183, above, and Junge, P. J.: 'Hazarapatiš: Zur Stellung des Chiliarchen der königlichen Leibgarde im Achämenidenstaat', in *Klio*, vol. xxxiii (Neue Folge, vol. xv) (Leipzig 1940, Dietrich), pp. 13-38. The Hazarapatiš could not have performed his duties without being served by a skilful, organized, and numerous administrative and clerical staff. The scale of his Chancery is indicated by the quantity of the imperial archives. By A.D. 1940 no less than 30,000 clay tablets, inscribed in the Elamite language, had been discovered at Persepolis alone by Modern Western archaeologists (see Junge, *op. cit.*, p. 14, n. 2), and the collection at Susa, the principal seat of the Achaemenian imperial administration, must have been far larger (see *ibid.*, p. 30, n. 3). These bulky, heavy, and brittle records on clay, together with the staff whose duty it was to keep them up to date and to consult them for administrative purposes, must have

menian civil service never developed beyond this point,¹ the Ottoman Government provided for its corresponding administrative needs by doing everything that human ingenuity could devise, and human determination accomplish, to produce a civil service that was to be no mere professional fraternity but a secular equivalent of a religious order, so rigorously segregated, austere disciplined, and potentially 'conditioned' as to be transfigured into a super-human, or sub-human, race—as different from the ordinary run of human kind as a thoroughbred and broken-in horse, hound, or hawk is from the wild life that has been the breeder's and trainer's raw material.²

At divers points between these two extremes we may place the professional civil services that were taken over by the Umayyad Caliphate from the Roman and Sasanian empires and by the Manchus from the Ming; those that were inherited from the pre-imperial past of the empire-building state by the Ts'ing Empire in the Sinic World, the Mongol Empire in the Far Eastern World, and the Spanish Empire of the Indies; those that were modelled in the British Rāj in India, in the Napoleonic Empire, and in the Danubian Hapsburg Monarchy on home-grown institutions of the metropolitan countries that were themselves new creations; those that were worked out more or less *ab initio* in the Han Empire, the Roman Empire, and 'the Middle Empire' of Egypt; and those that, like the professional civil service of the Petrine Russian Empire, were fashioned on a last of an alien mould.

The Taking Over of an Existing Civil Service by a Barbarian Conqueror

The taking over of the existing civil service of a conquered polity is an expedient that almost forces itself upon empire-builders when these are barbarians who have won their empire by a sudden stroke and when the conquered polity itself has been a universal state whose imperial civil service has still been a going concern at the time of the conquest. Yet, though, in this situation, the main lines of action may be dictated by circumstances, there will still be some room for the free play of statesmanship. The barbarian empire-builders may be more or less receptive, and the subjugated civil servants more or less pliant; and it is a question of judgment how far the conquering ex-barbarian imperial

remained, year in and year out, in the administrative centre, whichever one it might be, where they had originally been inscribed and deposited; they cannot have accompanied the Emperor and his Court on their seasonal migration between Susa, Babylon, and Ecbatana, or on their occasional state visits to Persepolis (see pp. 205-7, above). Junge conjectures (*ibid.*, p. 33 and p. 34, n. 4) that, besides being responsible for the Imperial Chancery, the Hazarapatiš was invested with the command over the imperial garrisons in the provinces.

¹ The differentiation from one another of the Imperial Household, the Imperial Treasury, and the Imperial Chancery, which was a feature of the subsequent Sasanian régime, was still unknown to the Achaemenidae (see Junge, *op. cit.*, p. 30, n. 4). The Emperor's Bow-Bearer and Lance-Bearer served, no doubt, as his adjutants (see *ibid.*, p. 22), and perhaps as his private secretaries. The post of Cup-Bearer, which came to be frequently, and in the end perhaps exclusively, held by eunuchs, seems to have carried with it the comptrollership of the Corps of Pages and of the whole personnel of the Household (see *ibid.*, pp. 19-21). The Book of Nehemiah indicates how well placed the Cup-Bearer was for winning the Emperor's ear, and there seems to have been a tendency for him to gain in power at the Hazarapatiš's expense (see Junge, *ibid.*, p. 37).

² For the ideal inspiring the creation of the Ottoman Pādīshāh's Slave-Household, see the passage quoted from Lybyer in III. iii. 32-34.

people is to resign itself to taking over the conquered ex-imperial civil service lock, stock, and barrel as a permanent solution for its own problem of having to administer an empire, and how far it shall venture to reject or modify the institution that has so providentially fallen into its hands, for the sake of trying to preserve at any rate the more valuable elements in its own native communal tradition and *éthos*.

The Umayyad princes, on whom the sweeping conquests of the Primitive Muslim Arabs had conferred an unexpected dominion over ex-Roman and ex-Sasanian territories, compelled their Christian and Zoroastrian civil servants in the third generation to substitute Arabic for Greek, Coptic, and Pehlevi as the official language of the public records,¹ without attempting to take over the business of administration themselves; and, though under the ensuing 'Abbasid régime—especially from the ninth century of the Christian Era onwards, when the 'Abbasid Caliphate was declining towards its fall—the process of conversion to Islam became a landslide which carried into the Islamic fold a majority of the population of the Caliphate of all classes and occupations, the residual unconverted Christian minority continued to play a part in the civil service, and especially in the revenue administration, that was out of proportion to its eventual numbers.

In the less abrupt course of the establishment of the Manchu Empire over China, the reciprocal relations of Manchu and Chinese administrative institutions came to be adjusted more subtly.

In the Manchu polity a Chinese-inspired bureaucracy had already prevailed over both the original clan system and the subsequently engrafted feudal system, that had been the Manchus' own communal heritage, in the organization of the Manchu 'banners'² that had been created in A.D. 1601, forty-three years before the Manchus had embarked on the conquest of Intramural China.³ To staff a bureaucratic administration of their newly established banners, the Manchu Central Government commandeered Chinese scholar-serfs from the Manchu feudal lords,⁴ and, if a new element had not entered into the situation thereafter, the Manchu Power might have followed independently the path that the Ottoman Power took when it provided for the government of its empire by building up the Pādishāh's Slave-Household. In the history of the Manchu Empire, however, this embryonic servile civil service never came to maturity; for the Manchu empire-builders soon came to recognize the expediency, and indeed necessity, of taking Chinese civil servants into the Manchu service as free men enjoying the status that was traditionally theirs under an indigenous Chinese régime.⁵

¹ See p. 242, n. 3, above.

² See p. 129, above.

³ See Michael, F.: *The Origin of Manchu Rule in China* (Baltimore 1942, Johns Hopkins University Press), pp. 61 and 64.

⁴ See Michael, op. cit., pp. 58 and 68.

⁵ See *ibid.*, p. 68. While the Manchus took the Chinese into their service on these generous terms at an early date and of their own free choice, the 'Osmanlis did not take the corresponding step of employing Greeks as freemen, unconverted to Islam, until they were constrained by the breakdown of the Pādishāh's Slave-Household and by a turn in the tide of war, in favour of the Western Christian Powers, which for the first time made the Ottoman Government feel the need for diplomacy and consequently appreciate the qualifications of their Greek Christian *ra'îyeh* for negotiating with Western diplomats on their Ottoman masters' behalf (see II. ii. 223-5; III. iii. 47-48; and V. vi. 299).

The epoch-making event that produced this change in the Manchus' attitude and policy towards Chinese litterati was the desertion in A.D. 1618, from the Ming to the Manchu service, of Li Yung-fang, the Chinese commandant of Fushun, a strategic point just inside the Great Wall at its eastern extremity on the coast of the Gulf of Chihli. The possibility of Li's adhesion to their cause promised the Manchus so important an advantage that they offered him admission to their service on terms of equality. He accepted the offer, and this bargain created a precedent by which Li's compatriots benefited from that time onwards.¹ In fact, 'the Chinese forced their standards on the invader'.² In A.D. 1631, thirteen years before the Manchus' passage of the Great Wall, a conference of Manchu feudal lords and high officials decided in favour of adopting the traditional Chinese bureaucratic organization for the central government;³ and the Manchu administrative system was duly Sinified by Prince Dorgon, the son of the founder of the Manchu Power, Nurhachi (*regnabat* A.D. 1618-25), and the younger brother of Nurhachi's successor T'ai Tsung (*regnabat* A.D. 1625-43).⁴

'Feudalism had given the Manchus their first integrating power. The acceptance of bureaucracy in the banner and central administration made them a state. It was the Chinese system, Chinese officials and Chinese ideas that enabled the Manchus to conquer China.'⁵

The tottering Ming régime was given its *coup de grâce*, not by the Sinified Manchu Power beyond the Great Wall which was to succeed, in the event, to the fallen Ming régime's heritage, but by a rebel who had raised his horn in the interior of China. As against the Manchus, Li Tse-chêng, after occupying Peking, had the double advantage of being in possession and being Chinese. In the revolutionary breaks in the history of the Chinese state, native Chinese rebels, no less than barbarian invaders, had found themselves unable to gain possession of the Empire without the use of force,⁶ and for this reason the aspirants to supreme power in times of anarchy, whether barbarians or Chinese, had usually been men who had little to lose and who had had to fight to hold even what they had.⁷ Li Tse-chêng, the extinguisher of the Ming, conformed to the historic type of successful Chinese rebel in being an illiterate proletarian. On the other hand, the *ci-devant* barbarian Manchus were by this time in the second generation of Sinification and, in the process, had become men of substance with something to lose and therefore with a motive for hesitating to put their fortunes to the touch by playing for the greater but more hazardous prize of oecumenical dominion.⁸

In the circumstances, that prize might have remained in the bandit Li Tse-chêng's hands if the issue had depended on him and the

¹ See Michael, *op. cit.*, pp. 69-72.

² *Ibid.*, p. 75. As has been noticed in III. iii. 31, n. 1, Chinese litterati at the Manchu Court were styled 'officials' (*ch'en*), whereas Manchu officials were styled 'slaves' (*nu*). This distinction of nomenclature lasted down to the fall of the Manchu régime in A.D. 1911 (see *ibid.*).

⁴ See *ibid.*, p. 9.

⁵ See *ibid.*, pp. 76-77.

⁶ *Ibid.*, p. 79.

⁷ See *ibid.*, p. 41.

⁸ The Manchu Government had even waited till A.D. 1636 to repudiate the suzerainty of the moribund Ming over their extramural principality (Michael, *op. cit.*, pp. 100 and 103).

Manchus alone. In the history of the antecedent Sinic Civilization, Liu Pang had become the founder of the Han Dynasty through a very similar career. In the crisis of A.D. 1644, however, the issue was decided otherwise by the suffrages of a third party. The Chinese civil service, and the scholar-gentry from whose ranks they were drawn, could not stomach the illiterate usurper, while they felt that there was a future for them under an ex-barbarian Power which had already given practical proof of its esteem for the Confucian culture by Sinifying itself of its own accord.¹ The Manchus crossed the Great Wall with at least the hint of a mandate to make the Empire safe for the Chinese scholar-gentry against the barbarian from within; and, though there proved to be nationalist-minded elements in the South of China which refused to recognize the Manchus' cultural mission and which remained unreconciled to the Manchu domination to the end of the story, the unenthusiastic yet efficacious support of the Chinese cultivated class enabled the Manchus to make themselves masters of China and to hold their prize for more than a quarter of a millennium.

'The Manchu State was growing in the Chinese World at the edge of the Chinese Empire. Its development can only be understood in its relationship to the Chinese Empire, as it was—though a conquering force—still a part of China all the time.'²

At the same time the Manchus did not become Chinese altogether without reservations. While they adopted the Confucian philosophy and educated their young men in it, they interpreted Confucian virtue in military terms³ that would have been more acceptable to the Sinic hereditary feudal nobility of Confucius's day than to Confucius himself or to the latter-day *chün tze* of the Han Age who bore the by then extinct feudal class's historic name, while teaching and practising what they believed to be Confucius's philosophy.⁴ T'ai Tsung warned his Manchus against assimilation to the Chinese civilian way of life.⁵ 'The banners had at first been the Manchu state. Now'—as a consequence of the Manchu Power's momentous act of taking over the Chinese State as a going concern under the administration of the established Chinese professional civil service—the banners 'became a state within a State'.⁶ In this equivocal position they did, however, maintain their existence and retain their identity till the Manchu régime in China fell, in its turn, in A.D. 1911.

Experiments in Recruiting a Civil Service from an Existing Aristocracy

The Manchus and the Primitive Muslim Arabs were exceptional among empire-builders in the scantiness of the indigenous cultural and institutional heritage that they brought with them. Most of their peers had come into the saddle better equipped, and, in addressing themselves to the unfamiliar and formidable task of governing an empire, they had naturally been apt to turn to account as far as possible, for

¹ See Michael, *op. cit.*, pp. 113-14.

⁵ See pp. 355-6, below.

⁶ *Ibid.*, p. 118.

this new purpose, the social heritage of the pre-imperial age of their own national history.

The Manchus themselves, as we have seen, had developed the rudiments of a tribal and feudal aristocracy before they embraced the Confucian culture and virtually put themselves in the hands of the Chinese civil service as the price of their acquisition of the Chinese Empire. Longer-established national aristocracies were in existence, by the time of their accession to oecumenical power, among the Persian henchmen of the Achaemenidae and among their Macedonian supplanters; among the clansmen of the Inca Emperors and among their Spanish supplinters; and in the hereditary dominions of the Hapsburg founders of the Danubian Monarchy. There was an incapable aristocracy in Muscovy at the time when Peter the Great took her Westernization in hand, and a highly capable one in the Roman Republic at the date of the foundation of the Principate.

In each of these cases the aristocracy descending from a previous age was drawn upon by the founder or reorganizer of a universal state as material for the building of an oecumenical administrative structure. The motives prompting an identical policy were, however, widely diverse. While Peter the Great tried to dragoon the old-fashioned Muscovite nobility into becoming the cultivated, efficient, and industrious administrators in the contemporary Western style whom he needed urgently in large numbers, Augustus took the politically experienced Roman Senatorial Order into a cautiously regulated partnership with his own new dictatorial régime, not so much because he needed or desired their collaboration as because he judged this policy of appeasement to be a prudent measure of insurance against suffering his adoptive father's fate at the hands of an old governing class whose thirst for power was still unsatiated, and because he realized that, in spite of their shameful and notorious betrayal of their trust during the last 150 years of their government of the Roman body politic, the Senatorial Order had not yet exhausted the credit of an accumulated prestige.

These antithetical problems that confronted respectively Augustus and Peter the Great are the horns of a dilemma that is apt to catch the architect of a universal state who finds himself with an imperial people's pre-imperial aristocracy on his hands. If the aristocracy is capable and experienced, it will probably be resentful of the change in its fortunes that has left it no opening, except the unpalatable service of a dictator, for still exercising those administrative capacities which it has developed through having been in power on its own account before losing its old political supremacy to its new master. Conversely, if the aristocracy is easy-going, the dictator who seeks to make use of its services will probably find that the innocuousness of his tool is offset by the bluntness of its edge. After Peter the Great's attempt to turn Muscovite nobles into Western-style administrators had been tried for two generations,¹ the Petrine Imperial Government gave it up as a bad

¹ Peter and his successors tried to use the Russian nobility in the provincial, as well as the central, administration by enrolling them in colleges of Landrats modelled on those

job¹ and granted the hereditary nobility a conditional exemption from public service in A.D. 1762.² On the other hand, Augustus, who was as anxious to dispense with his *virī senatorii* as Peter was to make use of his *boyars*, had to be content with making them ineligible for the single governorship of Egypt (a province that was a personal conquest of his own, and whose resources were so extensive and so efficiently concentrated in government hands that no Roman emperor could afford to see a Roman senator in control of them). The best part of three centuries was to pass before Augustus's successor Gallienus (*imperabat* A.D. 260-8) could venture, in the equalitarian revolutionary atmosphere of the third century of the Christian Era,³ to set about excluding the senatorial class systematically from key positions of public responsibility and power; and, even then, nearly half a century elapsed before Gallienus's work was completed by Diocletian (*imperabat* A.D. 284-305).⁴

Among the other national aristocracies, mentioned above, whose fortune it was to be called upon to share in the administration of a universal state, the Macedonian, like the Roman, nobility was competent but recalcitrant. In the generation of anarchy in Macedon preceding the accession of Philip II these spirited and turbulent Macedonian rural barons had enjoyed as great a licence as the Polish nobility in the age preceding the Partition of A.D. 1772, and they fiercely resented being called upon to become the devoted humble servants, *more Persico*, of a once constitutional king of their own blood who had formerly been proud to recognize them as his social peers (*ἐταίροι*). They rebelled against this demand even when it was made of them by a legitimate king of the Argead line who had won a position of unique eminence by overthrowing and supplanting the last Achaemenid. Still less willing were the Macedonian nobility to serve a despotic master when their lawful King Alexander was replaced by a batch of noble-born usurpers of the royal title, in whose shoes any other Macedonian noble military adventurer might have found himself standing if the luck of the game, in the scramble for power after Alexander's death, had happened to come his way instead of playing into the hands of his peers the Ptolemies, Antigoni, and Seleuci. In these psychological circumstances it was no wonder that the Seleucids and the Ptolemies had to look for ministers and administrators for their successor-states among the adaptable

that were a going concern in the Baltic Provinces that Peter had conquered from Sweden (see Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 505).

¹ Peter found himself constrained, by an effective passive resistance, to revoke, after a two years' trial, his edict of A.D. 1714, ordering all landowners and civil servants to send their children, between the ages of ten and fifteen, to his newly founded secular elementary schools. Peter vainly tried to enforce this edict by making a school-leaving certificate a pre-requisite—in the case of all persons subject to the edict—for a licence to marry (see Sumner, B. H.: *Peter the Great and the Emergence of Russia* (London 1950, English Universities Press), p. 153, and the present Study, III. iii. 282, n. 2). A would-be bridegroom had to satisfy the examiners in arithmetic, geometry, and navigation (see Mettig, op. cit., p. 412).

² See Mettig, C.: *Die Europäisierung Russlands im Achtzehnten Jahrhundert* (Gotha 1913, Perthes), p. 413; Sumner, op. cit., pp. 197-8.

³ For this revolutionary movement and its triumph, see pp. 152-8, above.

⁴ See Grosse, R.: *Römische Militärgeschichte von Gallienus bis zum Beginn der Byzantinischen Themenverfassung* (Berlin 1920, Weidmann), pp. 4-9. Between Augustus's day and Gallienus's, Septimius Severus (*imperabat* A.D. 193-211) had followed the precedent set by Augustus in Egypt when he enlarged the Roman Empire by adding the new

citizens of the city-states of the Hellenic World rather than among their intractable fellow noblemen from Hellas' Macedonian march.

By contrast, the grandees of Spain were ready enough to serve the Spanish Crown as viceroys and captains-general of the kingdoms of the Indies, even though the crown was worn by foreign Hapsburg and Bourbon heads, while, in the Danubian dominions of the eastern branch of the House of Hapsburg, the nobility of the dynasty's Austrian hereditary dominions was likewise willing to serve an Imperial-Royal-Archiducal master in the task of attempting to knit into a unity the congeries of kingdoms and lands which had been shaken into the lap of the *Caesarea Maiestas* by the shock of the Ottoman victory at Mohacz in A.D. 1526.¹ These Austrian and Spanish aristocrats, however, were as sluggish as they were loyal. In fine, of all the aristocracies to whom Fortune had offered an opportunity for distinguishing themselves by sharing in the administration of a universal state, the Persian *megistânes* and the Inca *orejones* alone had risen to the occasion—and, in rising to it, had redeemed the credit of their caste by acquitting themselves so well that, in the hour of their defeat and humiliation, they extorted a posthumous tribute of praise from the mouths of the very adversaries who had beaten and supplanted them.²

Experiments in Recruiting a Civil Service from Novi Homines

Such pre-imperial aristocracies were the principal, but not the only, national administrative material that empire-builders had brought with them for setting about their oecumenical task. The blue-blooded viceroys whom the Spanish Crown sent out to New Spain and Peru would hardly have succeeded in turning the offspring of the unmanageable *conquistadores* into governable Creoles if they had not had the assistance of middle-class lawyers whose natural ability was fortified by a professional training and tradition. As for the Mongols, they would assuredly have failed to retain, even for one lifetime, their hold on China, Russia, Iran, and 'Irâq if they had not had the good sense to enlist the secretarial services of Nestorian Christian Uighurs whom they took over from their Karâyit and Naiman predecessors in the hegemony of the High Steppe.³ But the most formidably—though, as it turned out, fatally—well equipped of all empire-builders was Ts'in She Hwang-ti.⁴

While the six rival contending states that succumbed to the last king of Ts'in and first emperor of a Sinic universal state were still living under the traditional feudal régime of the Ch'ou dispensation, the corresponding régime in the State of Ts'in had been liquidated by the revolutionary reforms of the Lord of Shang nearly a hundred years before the future First Emperor's accession to the parochial throne of

province of Mesopotamia and enlarged the Roman Army by adding the three new *Legiones Parthicae*. Members of the Senatorial Order were disqualified from holding either the governorship of Mesopotamia or any of these three new legionary commands (see Grosse, op. cit., p. 4).

¹ The Danubian Hapsburg Monarchy was created and kept in being by Ottoman military pressure, as has been noticed in II. ii. 177-88.

⁴ See pp. 169-74, above.

Ts'in in 246 B.C.¹ as King Chêng. In place of the liquidated aristocracy of Ts'in the reformer had installed a professional bureaucracy, and the concentration of power in the royal government's hands as a result of this drastic administrative reorganization was the secret of Ts'in's subsequent advance from strength to strength which culminated in King Chêng's feat of overthrowing all his competitors and thereby making himself master of the entire Sinic World in 230-221 B.C. The cause of Ts'in's dramatic triumph was, however, likewise the cause of the equally dramatic reversal of her fortunes on the morrow of the First Ts'in Emperor's death.

The unimaginatively revolutionary-minded conqueror had committed the fatal blunder of trying to hold his conquests by the use of the same instrument that had won them. Not content with subduing and annexing the six rival states, he deposed their feudal aristocracy as well as their royal houses, and put their administration in the hands of bureaucrats from his own hereditary kingdom of Ts'in, without realizing that he was imposing on his victims a sharper affliction than they could bear. Even in Ts'in a century back, Lord Shang might have failed to carry through his revolution at the local aristocracy's expense if Ts'in had not been a rude and backward march-state where tradition had less strong a hold than in more mellow countries nearer the heart of the Sinic World. The abrupt imposition of the rule of the bureaucracy of Ts'in upon the people of these other countries a hundred years later brought the loss of their independence home to them in a direct personal way. It was a misfortune for the ambitions of Ts'in She Hwang-ti that, owing to Lord Shang's revolutionary service to his royal predecessors, he found himself in possession of the means to carry out the intolerably sweeping administrative revolution which his own successful successor Liu Pang deliberately forbore to emulate on the morrow of the swift undoing of Ts'in She Hwang-ti's revolutionary work.

The builders of two other universal states had drawn, with happier results, upon the practice and personnel of a civil service which the empire-building community had not inherited from the past but had created to meet its own domestic needs at home in the same generation in which the task of imperial administration had descended on its shoulders. This was the means by which the French equipped themselves for administering the Napoleonic Empire in a politically stagnant Central Europe, and the British for reconstructing a derelict Mughal Rāj in India.

The character and achievements of the British Indian civil service can hardly be understood without being looked at against the background of an immediately preceding chapter of administrative history in the United Kingdom.

'The institution of factory inspection by the Act of 1833 was a stage in the development of a new kind of civil service. . . . Bentham's passion for substituting science for custom, his view of administration that it was a

¹ In 246 B.C. according to Fitzgerald, C. P.: *China, A Short Cultural History* (London 1935, Cresset Press), p. 70; in 247 B.C. according to Franke, O.: *Geschichte des Chinesischen Reiches*, vol. 1 (Berlin and Leipzig 1930, de Gruyter), p. 226.

skilled business, had in this instance results that were wholly satisfactory: under his inspiration England created a staff that brought to its work training and independence; unlike the English Justice of the Peace, the new Civil Servant had knowledge; unlike the French *intendant*, he was not the mere creature of a government. The English people learnt to use educated men on terms that preserved their independence and their self-respect. . . . For the moment, the chief occupation of this educated class was to throw a searchlight on the disorder of the new world. Nobody can study the history of the generation that followed the passing of the first Reform Bill without being struck by the part played by lawyers, doctors, men of science and letters in exposing abuses and devising plans.¹

The new fraternity of middle-class professional administrators which took a passage to India, after having thus made its way peacefully to the front in England, had, in France, to force an outlet for itself by an explosive outbreak of its artificially dammed-back energies.

'The French bourgeoisie of '89 belonged to a class proud of its economic independence and of its social standing. Its members had earned or inherited a competence derived from honest toil. They cherished a self-respect that set them no further from the *aristos* above them than from the *sansculottes* below. Yet they resembled the English aristocracy, and differed from that of their own country, in being a class, not a caste. Their ranks were not fixed, but fluid. There was always an element in them surging up from *roturier* to *bourgeois*, and from *bourgeois* to noble. . . . Hitherto they had been kept out of the government of a country which they enlightened and enriched. But nothing had been able to exclude them from the management of its trade, its agriculture, or its administration. Here they had become apprenticed to political power. Here, during half a century of political outlawry, they had been educating themselves for 1789.'²

The new field of action that the French *bourgeoisie* now opened up for themselves was a bureaucratic public service, which was called for to fill an institutional vacuum created in France by the Revolution itself before the French conquests abroad, which the Revolution set in motion, enlarged this vacuum to embrace Flanders, Italy, and Western Germany and to give a French bureaucracy *in partibus peregrinis* a different function from that which it had recently been called into existence to perform at home.

'The French had long lost the feeling for local autonomy, and the efforts to decentralise the government of the *Ancien Régime* had not had time to fructify before the Revolution supervened. That catastrophe eliminated the aristocracy, sowed hate and jealousy in every village, and prevented any further development of the constitution on the lines laid down by Turgot and Necker. A centralized bureaucracy was a necessity for France, being, as it were, not only a kind of anaesthetic or healing drug, but also the elementary condition for the preservation of all that was precious in the revolutionary movement. Among the lethargic inhabitants of Westphalia the mission of the bureaucracy was not to calm but to excite, not to preserve but to communicate. . . .'³

³ Fisher, H. A. L.: *Studies in Napoleonic Statesmanship in Germany* (Oxford 1903, Clarendon Press), pp. 269-70.

'It was not merely by their laws that the French left a permanent mark upon the Duchy [of Berg]. Their administration was a pattern and a precedent. The Prussians, indeed, had done good bureaucratic work in Mark and in Münster before the French occupation, but it was the French who first adequately expounded the arts of finance and administration to the whole region. To the slovenly government of the Bavarians in Berg, the French methods, combining, as they did, strict control with prompt, orderly and intelligent action, and distinguished always for their clear definition and distribution of functions, were related as the railway train is related to the stage coach.'¹

Napoleon was seeking to carry out in a subjugated Central Europe the long overdue administrative reformation that Ts'in She Hwang-ti had tried to impose upon the subjugated states of the Sinic World 'outside the passes', and the great demonic French innovator's tragedy was the same as his Sinic counterpart's. In forcing the pace of revolutionary change without mercy on Human Nature, he defeated his reformatory purpose and brought his own work to grief.

'There has been no greater master in the art of using, driving, and inspiring men. He found great disorder and demoralisation; he created a bureaucracy more competent, active, and enlightened than any which Europe had seen. But, as the Consulate passed into the Empire, and as the growing palsy of despotism spread over France, the quality of the work declined. The best men hated the never-ending wars and saw insanity written in large tokens over their master's schemes. . . . All criticism, all independent political thought, expired. Resolutely closing his eyes to unpleasant facts, Napoleon insisted that his servants should be blind also, and, being despotic and irritable, he was able to exact a constant supply of nutriment for his illusions. The men who spoke the truth and thought justly were dismissed or scolded; and, as compliance came to be rated more highly than ability, the most precious qualities were excised from public life.'²

The Metamorphosis of an Hereditary Aristocracy into a Professional Civil Service

If Napoleon and Ts'in She Hwang-ti deservedly failed in their attempt abruptly to force an alien bureaucracy on their subjects, Augustus and Han Liu Pang well deserved the success that attended their humane and statesmanlike policy of calling a new civil service into existence to answer to the needs of the devastated, disorganized, and weary world for whose welfare each of them found himself responsible. The administrative systems founded by the Hellenic bourgeois and the Sinic peasant saviour of society were perhaps the two finest secular institutions that, down to the time of writing, had yet been fashioned by the wisdom and benevolence of Man; yet, when they are compared with one another, their merits can be seen to be as unequal as their longevity. The Roman imperial administrative system, which went to pieces in the seventh century after its inauguration by Augustus, was not on a par with the Han system which had been founded 150 years earlier and which lasted, with at least a thread of continuity, down to A.D. 1911.

¹ Fisher, op. cit., p. 222.

² Ibid., pp. 374-5.

The defect of the Roman imperial civil service was its reflection of the discord between the old republican senatorial aristocracy and the new imperial dictatorship which an Augustan compromise had glozed over but had not healed. In the Roman imperial civil service under the Principate there were two rigidly segregated hierarchies and two mutually exclusive careers in which the senatorial and the equestrian civil servant went their respective ways. This schism in the heart of the service was, as we have seen, eventually brought to an end in the third century of the Christian Era, not by the achievement of that *concordia ordinum* which the public interest had always required, but by a high-handed elimination of the Senatorial Order from all posts of administrative responsibility. Their discomfiture, however, did not leave their equestrian rivals in enjoyment of a monopoly of the imperial service; for by this time the decay of local civic self-government had so swollen the volume of the imperial service's work¹ that Diocletian found himself compelled to make an inordinate increase in the permanent establishment of the civil service as well as the army; and in a post-Diocletianic Age the entry into the service was open to any Roman citizen possessed of the necessary degree of education, without discrimination between classes. The contrast with the history of the Han imperial civil service² is instructive. The opening of careers to talent, which was not achieved in the Roman Empire till more than three hundred years after the establishment of the Augustan Peace, was inaugurated in the Han Empire by Han Liu Pang himself, within six years of his restoration of order in 202 B.C., in an ordinance, issued in 196 B.C.,³ in which he directed the provincial public authorities to select candidates for the public service on a test of merit, and to send them to the capital for appointment or rejection by the officers of the Central Government.

This new Sinic civil service received its definitive form when Han Liu Pang's successor Han Wuti (*imperabat* 140-87 B.C.) decided that the merit required of candidates should be a proficiency in reproducing the style of the classical literature of the Confucian canon and in interpreting the Confucian philosophy to the satisfaction of the Confucian litterati of the day.⁴ Under the skilful handling of the Han emperors the transition from the old feudal order of the Ch'ou Age to the new bureaucratic order of the Han Age was made so smoothly—notwithstanding the violence of the abortively revolutionary Ts'in interlude—that old names acquired new meanings, and old doctrines new interpretations, by insensible degrees.

"The disappearance of feudalism was rendered possible by the policy of the Han emperors towards a very important and hitherto irreconcilably reactionary class, the *chün tze*. The aristocracy had been virtually destroyed by the revolutionary measures of She Hwang-ti, but they transmitted their ideals and their political outlook to a new class, the scholars and officials of the centralised empire. From this time onwards the *chün tze* cease to be an hereditary nobility distinguished by membership of a

¹ See pp. 59-60 and 166, above.

³ Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), pp. 274-5, gives a German translation of the text as recorded in the official history of the Prior Han Dynasty.

⁴ See V. v. 418-19, 654-5, and 708.

limited number of clans. The revolution had destroyed the territorial and clan basis of the old aristocracy for ever. The *chün tze*, including many of the old aristocratic families, became a class marked off from the mass of the people by education, and only by education. . . . The very meaning of the old terms became obscure. *Chün tze* had meant the son of a lord, member of a noble clan. Under the new régime it gradually came to mean a gentleman in much the same sense as [that in which] that word is used in modern English—one who had received a polite education.

'The later Han emperors adroitly favoured the new educated class. Themselves of peasant origin, with no trace of divine or noble blood to fortify their claim to the throne, it was of vital importance to the new emperors to discover some principle of legitimacy for their power. Noble blood and divine descent they could not claim; force, upon which the Ts'in had relied, had proved to be a double-edged weapon. The master-stroke of the Han emperors was to enlist in support of the centralised state the very school which had upheld feudalism to the last. . . . Their supreme achievement was to persuade the new scholar class, to whom the Feudal Age was personally unknown, that the doctrines of Confucius could be applied to the new political régime. . . .

'She Hwang-ti tried to destroy the memory of the past; the Han sovereigns, more subtle than he, succeeded in distorting it. The interpretation of the Confucian doctrine which gained currency during the Han Dynasty proved one of the most enduring results of the revolution. The ideal of a centralised state became closely associated with the scholar class and the followers of the Confucian School. Henceforward fissiparous movements are always opposed by the scholars, the very class who had defended ancient feudalism.'¹

The Confucian School of the second century B.C. which was thus tactfully coaxed into partnership with the Han imperial régime would have astonished Confucius himself by the enormity of its intellectual, as well as its political, departure from the founder's own standpoint. The break in scholarly tradition caused by Ts'in She Hwang-ti's burning of the books, and the syncretism in religion produced by the levelling of the former barriers between contending parochial states and by the inclusion of a host of semi-barbarous peoples within the pale of the Sinic Society through their subjugation by force of Ts'in and Han arms, had made of the epimethean philosophy of Confucius a melting-pot for exotic superstitions.² To translate the course of this chapter of Sinic social history into Hellenic terms, we should have to imagine the Emperor Marcus Aurelius making the Stoicism of his day³ into the official philosophy of the Roman civil service,⁴ and this Stoically rigged Roman ship of state being freighted with as heavy a cargo of superstition as Neoplatonism eventually took on board.⁵

To complete this imaginary parallel, however, we must picture the Stoic School in the next chapter of its history, after it has become the

³ For the flush of religious feeling that suffused the Stoicism of the second century of the Christian Era, see the passage quoted from Dill in V. v. 550-1.

⁴ Marcus's conscientious abstention from misusing his political power for the purpose of propagating his philosophic faith has been noticed in V. v. 705.

⁵ See V. v. 565-7 and 680-3.

official philosophy of a universal state, deliberately purging its doctrine and practice of the superstitious accretions of the preceding age, and abandoning to its unofficial rival, Neoplatonism, the mission of supplying a demand for a popular religion under a philosophical veneer. In the Sinic World in the course of the last three centuries of the Han régime, the Confucian School did jettison the superstition that it had picked up in its rough passage through a revolutionary last phase of the Sinic Time of Troubles and first phase of the universal state established by Ts'in She Hwang-ti and refounded by Han Liu Pang. Yet, although 'the rather arid doctrines of the Confucian scholars had little appeal for the mass of the people', and in consequence 'the popular religion, which Confucianism had rejected', fell into the hands of 'the principal heterodox philosophy, Taoism',¹ even the dehydrated official philosophy of the Han imperial civil service was a more effective inspiration for a corporate professional way of life than the merely literary archaistic culture that was the shibboleth of a post-Diocletianic Roman civil service.²

A comparable vein of literary archaism was, indeed, carried to perhaps even greater lengths of absurdity by the Confucian School in the Han Age,³ with the same unfortunate effect of cutting off a civil service that plumed itself on this conceit from the realities of contemporary life outside its own charmed circle; but the pedantic canon of literary taste to which the Han imperial civil service had subjected itself was always the handmaid of a rule of conduct which, however pedantic it, too, might be, still gave its followers a social cohesion among themselves, even when they had lost human touch with the rest of Society. This bond of a common traditional ethic was lacking among the Han civil servants' Roman counterparts; and no doubt this was one of the reasons for the difference in the fortunes of these two official corporations during the interregna following the break-up of the universal states whose respective servants they had been.⁴

¹ Fitzgerald, *op. cit.*, p. 261.

² See V. vi. 71-81.

³ See V. vi. 81-83.

⁴ This difference is explored further on pp. 370-2, below. While one cause of it was the Roman imperial civil service's lack of a corporate philosophy such as the Han imperial civil service acquired in the shape of a purged Confucianism, another cause was the lack of a spacious fastness, impregnable to barbarian attack, such as the Han imperial civil service found for itself in the South of the Sinic World, where the expansion of the Sinic Civilization during its Time of Troubles had been carried forward, by the united forces of the subsequent universal state, until the conquest of Nan Yüeh (the present Chinese provinces of Kwangsi and Kwangtung, together with Tongking) by Han Wuti in A.D. 111 brought an expanding Sinic World to the 'natural frontier' of the sea coast (see Fitzgerald, *op. cit.*, p. 181). The Yangtse Basin and the Southern Seaboard, unlike the Yellow River Basin, were unpropitious *terrain* for the cavalry of the Eurasian Nomad barbarian invaders of the Sinic World during the post-Han interregnum; and their defeat in A.D. 383 at Fei Shui (see Franke, *op. cit.*, vol. ii, pp. 95-97; the date is given as A.D. 387 by Fitzgerald, *op. cit.*, p. 257) was a decisive battle which may be compared, in respect of the magnitude of its consequences, to the defeats of the Mongols by the Egyptian Mamlûks in A.D. 1260, 1281, 1299-1300, and 1303 (see I. i. 350), since this battle insured the birth of a Far Eastern Civilization, affiliated to the Sinic, as those insured the birth of an Arabic Civilization affiliated to the Syriac. The Roman Empire embraced no fastness of comparable size that was immune against attack by the same Eurasian Nomad barbarian enemy, and in any case the barbarian invaders of the Roman Empire included sedentary peoples—highland Berbers and non-nomadized West Germans—who were less sensitive to the nature of the *terrain* than their more highly specialized Nomad fellow aggressors. In the politico-strategic geography of the Roman

In the art of converting an aristocracy of birth into a professional civil service, both Augustus and Han Liu Pang were to be surpassed by Peter the Great; for the wisdom of hastening slowly, which Han Liu Pang had learnt from the fate of Ts'ing She Hwang-ti's revolutionary handiwork, and Augustus from the fate of Julius Caesar's, was not only learnt by Peter from his own experience but was taken to heart by him in time to retrieve a first false start.

After having discovered, by trial and error, the unwisdom of attempting either to dragoon feudal nobles into becoming professional administrators¹ or to supersede them by a wholesale substitution of *novi homines* and foreigners, Peter set himself in A.D. 1722 gradually to convert the Muscovite nobility into an effective instrument of Russian Imperial administration by instituting an official hierarchy of military and civil ranks, in fourteen grades.

'Through each of these it was necessary to pass, beginning from the bottom, just as it had been Peter's practice to make his guards officers, like himself, start from the ranks. Promotion from grade to grade was to be partly by length of service and partly by exceptional merit. Standing in the state service took precedence of birth, even in the court and social hierarchy. The privileges of the land-owning class—notably those of owning serfs and of being exempt from the poll-tax—were extended hereditarily to all persons, whether Russians or foreigners, who reached the eighth grade, and in the case of the Army and Navy even from the lowest grade.

'Throughout his life Peter picked men for multifarious duties without regard to birth or class, in the interests of recruitment for military or state service. From this time forward the land-owning class began to receive an influx of newcomers, who in the course of the next two generations broadened its composition and changed its complexion. . . . Despite subsequent alterations, the table of ranks had a profound influence on the future. It set the stamp on the hierarchal, bureaucratic ordering of the upper class in military and state service, which during the next two centuries became so prominent a feature of the social structure of Russia. Rank, in the sense of position in the table of ranks, largely displaced birth or wealth in the administrative and social scale.'²

Empire the nearest counterpart to the great southern fastness of the Han Empire was Anatolia; but even Anatolia was constantly overrun by invading and occupying Persian and Arab armies in the seventh century of the Christian Era; and the measure of the break in administrative continuity, even here, is given by the contrast between the Diocletianic administrative organization, as it survived in Anatolia in the reign of Justinian, and the system of local government through army corps districts (*themata*), as it had emerged there within a hundred years of Justinian's death. Only the precincts of Constantinople remained inviolate, and this Constantinopolitan fastness was too small, and too alien in experience and outlook from the exposed and harried countryside, to play the part which the New South of the Sinic World was able to play in the affiliation of a new-born civilization to an extinct one. The administrative continuity between the Roman Empire that foundered in the seventh century of the Christian Era and the ghost of it that was evoked in the eighth century by Leo Syrus was one of form without substance, whereas in the Sinic World 'the flight of the scholars after the fall of Loyang [under the impact of Hiongnu Eurasian Nomad invaders in A.D. 311] brought civilisation into the South, and gave these provinces an importance which they had not possessed in the Han Empire, but which was to grow more and more marked in succeeding ages' (Fitzgerald, *op. cit.*, p. 260). Observers of the Sino-Japanese war of A.D. 1931-45 would have been reminded of the similar effect of a similar migration of a Westernized intelligentsia from Peking and the treaty ports into the south-western provinces of contemporary China. See further X. ix. 649-81.

In the judgement of an acute and sensitive Russian student of Russian history,

'La noblesse, cette nouvelle élite infiniment plus large, plus agile, plus capable d'avenir que l'ancienne, était sans doute, avec la nouvelle capitale, le don le plus précieux du tsar [Pierre] à la Russie future. Malgré Lomonossov et d'autres "parvenus" de génie, tout ce que la Russie a produit jusqu'au milieu du siècle suivant de grands hommes et de valeurs culturelles vient de cette classe ou du moins n'a pu éclore que dans le milieu formé par elle. . . . L'ascension culturelle, politique et sociale de la Russie, de Pierre 1^{er} à Alexandre 1^{er}, est l'œuvre de la noblesse.'¹

Experiments in Providing an Education for New Recruits

While the Han Empire and the Roman Empire created their magnificent civil services² out of their own respective social and cultural heritages, Peter the Great and his successors in Russia, when they were in search of administrative support for their enterprise of Westernizing their empire and had found the hereditary Muscovite nobility a broken reed,³ forced the pace in the first stage of the manufacture of their new bureaucratic 'nobility of service' by copying Western institutions and even enlisting Western personnel.⁴ The Cabinet Secretary instituted by Peter on a contemporary Western model⁵ performed for the autocrat of a Westernizing Muscovy the service that an Achaemenian emperor received from his hazarapatiš and a Roman Emperor from his praetorian prefect. The contemporary organization of Western governments likewise suggested the Senate that was established by Peter on the 22nd February, 1711, and was endowed with far-reaching executive powers,⁶ and the Administrative Colleges that were set up in A.D. 1717-18. Most of these colleges started life with Russian presidents and foreign vice-presidents to induct the Russians into new-fangled Western methods of administrative work.⁷ To provide the staff, Swedish prisoners-of-war were roped in, and Russian apprentices were sent to acquire a Prussian training at Königsberg.⁸ In A.D. 1722 the office of Procurator-General was created for the purpose of keeping a 'king's eye'⁹ (to use the Achaemenian term) on both the colleges and the Senate.¹⁰ An historian who was a Westerner himself would like to believe—against the presumptive

Universities Press), pp. 155-6. See also Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 506, and the present Study, III. iii. 282, n. 2. Though the creation of this professional civil service was Peter's personal achievement, he did not have to start entirely from the beginning. ³ See pp. 349-50, above.

⁴ The first wave of immigrant Western bureaucrats consisted of German aristocrats from the Baltic Provinces after the conquest of these from Sweden by Peter the Great (see Sumner, B. H.: *Peter the Great and the Emergence of Russia* (London 1950, English Universities Press), p. 119). The second wave came from Germany itself during the sixteen years (A.D. 1725-41) immediately following Peter's death (see *ibid.*, p. 192). During Peter's reign, however, there were no non-Russians in the taxation service, the provincial governorships, or the Senate, and very few in the Ministry of Foreign Affairs and in the diplomatic service (see *ibid.*, pp. 204-5).

evidence of contemporary Venetian practice—that this official organization of espionage on the new Westernizing Russian civil service¹ was not likewise inspired by Western models.

Where, as in the Petrine Russian Empire, an imperial civil service is thus called into existence in conscious imitation of alien institutions, the need for special arrangements for the training of personnel is, of course, particularly evident.² At the same time, this need arises in some degree in all the divers situations in which an imperial civil service has to be provided, since it is inherent in the nature of a universal state and in the invariable circumstances of its advent in history.

An oecumenical polity of this type normally takes shape rather suddenly out of a cluster of contending parochial states that have brought a Time of Troubles to its climax and conclusion by an obstinate refusal to adapt themselves to the necessities of a new age. The problems, experience, institutions, and *éthos* of these anachronistic predecessors are manifestly unlikely to be of much use to the new polity that has at last belatedly superseded them. A fledgling universal state nearly always has, in the main, to supply its own needs for itself; and it cannot afford to imitate its parochial forerunners' comfortable habit, in the spacious days of their long-since vanished youth, of waiting upon experience to give them the necessary instruction; for the universal state has been brought into being as a response to the urgent challenge of its parochial predecessors' protracted failure to meet the World's political requirements; its mission is to grapple at once with the troubles of a society on the verge of dissolution; and, if it cannot draw profitably on its predecessors' experience and cannot wait to learn by experience of its own, it must take a leaf out of the book of Utopia³ and must improvise the education of a new type of administrator for a new form of government. Most universal states will be found to have worked out arrangements of some kind for educating the administrators that they need.

In the Incaic, Achaemenian, Roman, and Ottoman empires the Emperor's personal household was both the hub of the wheel of imperial government and the training-school for the administrators required for making the machinery of government work, and in a number of cases this educational function of an imperial household had been catered for by the creation, within it, of the special institution of a corps of pages.

At the Inca Emperor's court at Cuzco there was a regular course of education—with tests and ordeals at successive stages of initiation—in which the young men of the Inca's own imperial clan were brigaded

¹ See Brückner, *op. cit.*, p. 504.

² Peter the Great sought to meet this need *quam celerrimè* by sending batches of young Russians to be educated abroad from A.D. 1697 onwards. In A.D. 1697–8 he voluntarily performed, himself, a task that he was imposing on his subjects when he went abroad for eighteen months on 'the Great Embassy' in the suite of his Swiss-born ambassador Lefort (see Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), pp. 174–5; Sumner, B. H.: *Peter the Great and the Emergence of Russia* (London 1950, English Universities Press), pp. 34–41; and the present Study, III. iii. 281 and IX. viii. 556–7).

³ We have seen that Utopias are products of Times of Troubles. They are attempts to arrest the decline of a disintegrating civilization by 'pegging' it at the highest level still attainable. The price of this bid for survival is a sacrifice of plasticity; but, in a chapter of history in which plasticity represents a danger of disintegration rather than an opportunity for growth, rigidity comes to seem a blessing and not a curse (see III. iii. 88–111).

with the sons of the chiefs and notables of the subject peoples.¹ In the Achaemenian Empire 'all Persian boys of noble birth' were 'educated at the Emperor's court (*ἐπὶ ταῖς Βασιλέως θύραις*)',² 'from the age of five to the age of twenty, in three things and three only: riding, shooting, and telling the truth'.³ This Achaemenian method of breaking in noblemen for the public service was copied in the Hellenic kingdom of Macedon, which, on the political map of the Achaemenian world order, was a barbarian principality lying just beyond the pale of the universal state; and the borrowed institution proved its efficacy, to its Persian inventors' detriment, first in the service of the historic Macedonian Monarchy by which the Achaemenian Empire was eventually overthrown, and thereafter in the service of upstart Macedonian successor-states whose domains were carved out of a defunct Achaemenian Empire's carcass. The Petrine Russian Empire, whose relation to the Western World was not unlike Macedon's relation to the Achaemenian Empire, was likewise imitating its neighbours when it instituted a corps of pages.⁴

The Ottoman Court made similar provision for the education of pages in its early days at Brusa,⁵ and it was still treading a well-worn path when Sultan Murād II (*imperabat* A.D. 1421-51) established a school for princes at Adrianople, which was the capital of the Empire in his time;⁶ but his son and successor, Sultan Mehmed II Fātih (*imperabat* A.D. 1451-81), struck out a new line of his own when, after the conquest of Constantinople, he built his father's foundation at Adrianople into a new educational edifice, centred in his own palace in the conquered metropolis of Orthodox Christendom, which was not only laid out on a larger scale but was designed for the different purpose of staffing the Ottoman imperial administrative service, no longer with independent-minded princes of the Imperial House and sons of 'Osmanli Muslim noblemen, but with Christian slaves—including renegades and prisoners-of-war from Western Christendom, as well as 'tribute children' levied from the Pādishāh's Orthodox Christian subjects⁷—whose status of servitude, and still more, perhaps, their segregation from their ancestral environment, would make them peculiarly susceptible to the skilful process of 'conditioning' to which they were to be subjected as cadets in the Pādishāh's Slave-Household. This 'peculiar institution' of the Ottoman Empire⁸ has been described in a previous passage of this

⁵ See Miller, B.: *The Palace School of Muhammad the Conqueror* (Cambridge, Mass. 1941, Harvard University Press), p. 20.

⁶ See Miller, op. cit., p. 22.

⁷ Though the 'tribute children' accounted for less than half the total intake of imperial slaves, they were in a great majority among the élite selected for training and service in the Palace, which was the avenue to subsequent employment in the administrative service instead of employment in the standing army (see Miller, op. cit., p. 75).

⁸ The Ottoman Pādishāh's Slave-Household was a characteristic product of the Eurasian Nomad Society out of which the original nucleus of the Ottoman community had

Study¹ which need not be recapitulated here. At its zenith the Ottoman public slave-education system for entry into the administrative service was a graded pyramidal edifice of nine colleges ranged in four tiers, rising to the Hall of the Imperial Bedchamber at the apex.²

This establishment for training recruits for the administrative branch of the Slave-Household was built on such solid foundations of *esprit de corps*³ that, when in the last quarter of the sixteenth century of the Christian Era the free Muslim subjects of the Empire at last succeeded in forcing an entry into the military branch,⁴ the colleges composing the Palace School managed for another century and a half to keep their doors closed to boys of free birth and to continue to supply the Ottoman civil service with admirably trained slave-administrators.⁵ Even after Sultan Mahmūd II (*imperabat* A.D. 1808-39), in his thoroughgoing replacement of obsolete indigenous Ottoman institutions by substitutes of a Western pattern, had swept away the six colleges inside the palace precincts after his destruction of the Janissaries in A.D. 1826,⁶ he spared the Galata Seray, which in Mahmūd's day was the sole survivor of the former three extramural schools;⁷ and an abortive attempt, made by Mahmūd himself in A.D. 1828, to put the Galata Seray on a Western basis was eventually carried through successfully in A.D. 1868.⁸ As a *lycée* recog-

come, but it was a revolutionary innovation in the life of the Orthodox Christian sedentary society on which the Ottoman conquerors had imposed their rule. The Ottoman Sultans Murād II and Mehmed II were not the first Turkish-speaking empire-builders of Eurasian Nomad origin to found schools of public administration. When the Saljūq Turkish barbarian invaders of the dominions of the 'Abbasid Caliphate took over responsibility for carrying on the government of their august protégé-puppet, their gifted Minister of state, the Nizām-al-Mulk, included a division for training in public administration, as well as one for instruction in Islamic theology, in the celebrated *madrasah* which he founded at Baghdad in A.D. 1065-7 (see Miller, *op. cit.*, p. 12). His Nizāmiyah was a resident college (see *ibid.*, p. 16). Was this Saljūq precedent in the minds of the Ottoman Sultans Murād II and Mehmed II (see *ibid.*, p. 20)?

¹ In III. iii. 35-45. Since the publication of that volume of this Study, the Western World's understanding of the Pādishāh's Slave-Household, and of the educational institutions embedded in it by which it had provided for its own self-perpetuation, had been increased by the publication of two works of Western scholarship in addition to those mentioned in vol. iii, p. 32, n. 1. These subsequent published works were Penzer, N. M.: *The Harēm* (London 1936, Harrap); Miller, B.: *The Palace School of Muhammad the Conqueror* (Cambridge, Mass. 1941, Harvard University Press).

² The component institutions of this educational pyramid were, to enumerate them in ascending order: (i) three schools outside the precincts of Mehmed II's Palace at Constantinople, namely Murād II's school at Adrianople; a school in the Galata Seray on the opposite side of the Golden Horn from Istanbul; and Ibrāhīm Pasha's school in Istanbul, near the Hippodrome, which catered for cadets of Bosniak and Albanian origin. These three outside schools were preparatory for (ii) the Great and Small Halls inside the Palace. These, in turn, were preparatory for (iii) three vocational schools inside the Palace: the Hall of the Expeditionary Force (*Seferli Oda*) and the Halls of the Commissariat and the Treasury. The three vocational schools were preparatory for (iv) the Hall of the Imperial Bedchamber (see Miller, *op. cit.*, pp. 43-44 and 126).

³ The pages of the Palace School displayed a steady loyalty that was in strong contrast with the turbulence of the Janissaries (see Miller, *op. cit.*, p. 8).

⁴ See III. iii. 45.

⁵ See *ibid.*, p. 182.

⁶ See *ibid.*, p. 182.

⁷ See *ibid.*, p. 80. Compare the present Study, III. iii. 49, n. 4.

⁸ See Miller, *op. cit.*, pp. 182-3; Engelhardt E.: *La Turquie et le Tanzimat*, vol. ii (Paris 1884, Pichon), pp. 12-15; Davison, R. H.: *Reform in the Ottoman Empire, 1856-1876* (thesis submitted to Harvard University for degree of D.Phil., 1st April, 1942, typescript copy in the Harvard University Library). The lines on which the Galata Seray was to be reconstructed were laid down in March 1867 in consultations between Fu'ad Pasha and a French mission, and it was decided that it should be transformed into a secondary school on a Western model in which French was to be the language of instruction. This *lycée*

⁵ See Miller, *op. cit.*, p. 174.

nized by the Ministry of Education in Paris, the Galata Seray came, in the last chapter of the history of the Ottoman Empire, to be once again the *alma mater* of men of mark, not only among the Muslim ruling class of a truncated Turkey, but also among the Orthodox Christian elder statesmen of Turkey's Bulgarian successor-state.

While the Ottoman Pādīshāhs deliberately expanded their personal slave-household into an instrument for the government of a rapidly enlarged empire to the exclusion of the free 'Osmanlis who were the Ottoman imperial people, the Roman emperors, when they found themselves driven to make a similar use of Caesar's slave-household in an administrative emergency arising from the bankruptcy of the Roman republican régime, took steps first to limit and then to reduce the role of the imperial freedmen in the task of world government.

We have already noticed that Augustus reserved for members of the Senatorial Order the posts of highest dignity and heaviest responsibility in the service of the Princeps, quite apart from the senatorial monopoly of the administration of those provinces that the founder of the Principate handed back to the Senate under his system of 'dyarchy'.¹ No imperial freedman was ever appointed to the governorship of a major imperial province or to the command of a legion; and, when members of the Senatorial Order were eventually disqualified from holding these high posts,² it was the Equestrian Order that entered into their heritage. The freedmen's stronghold in the administration of the Roman Empire in the early days of the Principate was the central government, in which five administrative offices in Caesar's household—*ab epistulis*, *a rationibus*, *a libellis*, *a cognitionibus*, and *a studiis*³—had grown into imperial ministries of state;⁴ and even in these posts, which were traditionally the freedmen's preserve, the freedmen became politically impossible as soon as they had impolitically made themselves conspicuous. The scandal caused by the spectacle of Claudius's and Nero's freedmen-ministers exercising inordinate power led, under the Flavian emperors and their successors, to the transfer of one of these key posts after another from the hands of imperial freedmen to those of members of the Equestrian Order,⁵ which was the equal of the Emperor's slave-household in

was to be open to members of all Ottoman communities, and students who were successful in passing the leaving examination were thereby to acquire a right of entry into the Ottoman public service. The text of the Imperial Firman in which this project was given effect will be found in G. M. Young: *Corps de Droit Ottoman* (Oxford 1905-6, Clarendon Press, 7 vols.), vol. ii, pp. 377-80. The new-model Galata Seray was opened on the 1st September, 1868. Out of the 341 students enrolled, 147 were Muslims, 48 were Armenian Gregorian Monophysite Christians, 36 were Greek Eastern Orthodox Christians, 34 were Bulgar Eastern Orthodox Christians, 34 were Jews, 23 were Roman Catholics of the Latin rite, 19 were Roman Catholics of the Armenian rite. By December 1869 there were 622 students, including 277 Muslims, 91 Gregorian Armenian Christians, 85 Greeks, 65 Roman Catholics of the Latin rite, 40 Bulgars, 29 Jews, 28 Roman Catholic Uniat Armenian Christians, and 7 Protestant Christians. The Armenians and the Bulgars proved to make the best students.

⁴ See V. v. 452-3.

⁵ The first equestrian secretary of state *a rationibus* was appointed by Trajan (*imperator* A.D. 98-117) according to *The Cambridge Ancient History*, vol. xi (Cambridge 1936, University Press), p. 220.

business ability, and which could be placed in charge of the central administration of the Empire without offence to other free-born Roman citizens.

Thus in the history of the Roman civil service under the Principate the equestrian middle class gained ground at the expense of the slave underworld and the senatorial aristocracy alike. The Equestrian Order's victory over its rivals on either hand was justified by the efficiency and integrity with which the equestrian civil servants performed their official duties, and this redemption of a class which, during the last two centuries of the republican régime, had risen to wealth and power by a predatory exploitation of army contracts, tax-farming, and usury, was perhaps the most remarkable of the Principate's moral triumphs. The British Indian civil servants, whose record during the last four or five generations of the British Rāj, in the service first of the East India Company and afterwards of the Crown, could bear comparison with the record of the Roman equestrian civil servants at their best, were conjured out of much the same unpromising human materials as their Roman counterparts.

The antecedents of these British Indian civil servants likewise were commercial. They had originated as the employees of a private trading organization whose purpose had been pecuniary profit; one of their original incentives for taking employment far from home in an uncongenial climate had been the possibility of making money for themselves by personal trading on the margin of their work for their employers; and, when the break-up of the Mughal Rāj had suddenly transformed the East India Company from a mere commercial concern into the virtual sovereign of the Mughals' largest and most lucrative successor-state, the Company's servants had yielded to the temptation to make illegitimate and inordinate pecuniary profits out of the political power that Fortune had thrust into their hands,¹ with much the same shamelessness and irresponsibility as the Roman equites had shown when they had found a prostrate Hellenic World at their mercy after Rome's victory over Carthage in the Hannibalic War. In the British, as in the Roman, case, this start might have seemed so bad as to be beyond hope of retrieving;² yet in the British, as in the Roman, episode of administrative history a predatory band of harpies was converted in a surprisingly short time into a body of public servants whose incentive was not personal pecuniary

¹ See IV. iv. 511-12. The metamorphosis of the East India Company's servants 'from pettifogging traders . . . into imperialistic swashbucklers and large-scale extortionists' was accomplished between A.D. 1750 and A.D. 1785 (see Spear, T. G. P.: *The Nabobs* (London 1932, Milford), p. 23). 'The transformation of factors into soldiers and statesmen . . . meant that soldiers and officials brought commercial minds to their new duties, in which, if they were not always 2ver-careful of the Company's coffers, they never forgot their own' (ibid., p. 28). In Bengal the European adventurers' reign of terror was at its height from A.D. 1761 to A.D. 1771-2, when it was curbed by Warren Hastings' reforms (see ibid., pp. 32-33).

² In the early years of the nineteenth century of the Christian Era the highest reasonable hope might well have been thought to be the conversion of a piratical Clive into a chicken-livered Jos. Sedley (see IV. iv. 641). At Calcutta, where the transition from a respectable obscurity to a corrupt ascendancy had taken place between A.D. 1756 and 1765, there was a reversion towards respectability under Cornwallis' régime (*pro-consulari munere fungebatur* A.D. 1786-93). The nineteenth-century era of virtuous aloofness was inaugurated by Wellesley (*fungebatur* A.D. 1798-1805). See Spear, op. cit., p. 26.

gain and who had come to make it a point of honour to wield enormous political power without abusing it.¹

This redemption of the character of the British administration in India was due in part to the East India Company's decision to educate their servants for bearing the new political responsibilities that had fallen upon their shoulders. The Company acquired the financial administration of Bengal, Bihar, Orissa, and the Northern Circars in A.D. 1765; it opened its college in Hertfordshire for probationer-appointees to its administrative service in India in A.D. 1806; and the college played an historic role during the fifty-two years (A.D. 1806-57) for which it performed this function.²

The influence of an educational tradition and environment on the professional *éthos* of a civil service may be no less profound when the aspirants for admission to its ranks are educated in non-official institutions. In the history of the British Indian civil service, this was shown when in A.D. 1853-5, on the eve of the transference of the Government of India from the Company's hands to the Crown's, Parliament's decisions to recruit the service in future by competitive examination and to close the Company's vocational school for cadets opened the door to candidates drawn from the wider field offered by such non-official institutions as the universities of the United Kingdom and the so-called 'public schools' from which the English universities were almost exclusively recruited at that date.

In making this new departure in educational policy for the English contingent in the personnel of a British Indian civil service, Her Britannic Majesty's Government were unconsciously following the precedent set by Han Wuti when he decided to place the education of a Sinic imperial civil service in the hands of the Confucian school of philosophy.³

¹ See V. v. 47-48.

² The East India Company's College was installed in Hertford Castle at its opening in February 1806, but was moved into new buildings at Haileybury in A.D. 1809. There were about 100 students; the length of the course was two years; and the age of admission ranged between 16 and 19. A student obtained admission through a nomination by one of the Directors of the East India Company which assured him not only of a place in the college but of a post in India thereafter. This method of admission was abolished by an Act of Parliament, passed in A.D. 1853, which provided for the future recruitment of the Indian Civil Service by open competitive examination. The first examination of the kind was held in London in A.D. 1855, and the College was closed, by an Act of A.D. 1855, as from the end of the calendar year 1857.

Besides the contribution that it made to the improvement of British administration in India, the College had the distinction of contributing to the advancement of the science of human affairs through the work of Malthus, who was a professor on its staff from A.D. 1806 until his death in A.D. 1834.

³ In the histories of the Confucian and the British Indian civil services the experiments in official and unofficial education of aspirants for admission were made in an inverse order. While the British began by setting up a vocational college and then, on second thoughts, decided to rely, instead, on a traditional system of higher education in non-governmental institutions, Han Wuti entrusted the education of civil servants to the Confucian school of philosophy, and the alternative method of training them in a state college was not introduced until the renaissance of the Han Empire, in the shape of the Sui and T'ang régimes, in the history of a Far Eastern Civilization, affiliated to the Sinic, which arose after the social interregnum following the Han Empire's dissolution. When the political unification of the main body of the Far Eastern World by the short-lived Sui Dynasty had been repeated by the second sovereign, but actual founder, of the T'ang Dynasty, T'ai Tsung, one of his measures for placing his political achievement on enduring foundations was to give his unified empire a unitary civil service of Confucian scholars on the Han model. During the interregnum the Confucian scholar-

The indigenous Indian contingent in the personnel of the British Indian civil service—which always vastly outnumbered the handful of Europeans occupying the key posts at the top—was recruited, both under the Company and under the Crown, from the alumni of Western Christian missionary schools and colleges in India, and of Indian universities built up round them or founded side by side with them, whose curricula and standards were largely governed by those of the universities of the United Kingdom, particularly the University of London.¹ On the whole, it would seem that, the less direct the hand that a government finds it necessary to take in the training of candidates for its civil service, the more satisfactory the results are likely to be. The limits to the possibility of compulsory training and enrolment are illustrated by the experience of Peter the Great and his successors in Russia. Peter himself, as we have seen,² debarred Russian noblemen from contracting a legal marriage without having passed examinations in arithmetic, geometry, and navigation; and in A.D. 1736 a course of compulsory education from the age of seven to the age of twenty was imposed on noblemen's sons, with a series of three examinations in which a failure entailed the penalty of serving in the Army as a common soldier.³ Yet, as we have also seen,⁴ the disappointing experience of two generations of unprofitable coercion led the Russian Imperial Government in A.D. 1762 to grant an unsuccessfully dragged-on hereditary nobility a conditional exemption from compulsory public service.

Our survey of the methods and sources of recruitment of imperial civil services suggests that neither a pre-imperial hereditary nobility nor an imperial slave-household provides the best human materials for the purpose. Neither the attractiveness of the Persian *megistānes* and Inca *orejones* nor the impressiveness of the Ottoman Pādishāh's *qullar* can obscure the manifest truth that the most promising recruiting ground for an imperial civil service is a middle class which has served an apprenticeship in the responsible management of important and intricate non-official business. It was no accident that, in the history of the Roman imperial civil service, the Equestrian Order steadily gained ground at

administrator had survived in a fastness in the South (see p. 357, n. 4, above, and X. ix. 667). But, though the South was united politically with the North under the Sui and T'ang régimes, as it had been under the Han, the remnant of the scholar-administrator class in the South could not be expected suddenly to provide the personnel for staffing the whole of T'ai Tsung's united empire. Like the Ottoman Sultan Mehmed II after his conquest of Constantinople, T'ai Tsung filled an awkward vacuum by enlarging an existing imperial college and using it for the training of professional administrators. The new faculty of Confucian studies was instituted by him in A.D. 628, and in A.D. 630 he took action to provide the Confucian cadets for his resuscitated imperial civil service with the requisite means of instruction and examination by giving orders for the preparation of an official standard edition of the Confucian classics and—what was perhaps of still greater practical convenience—an official digest and elucidation of the existing commentaries (see Fung Yu-lan: *A Short History of Chinese Philosophy* (New York 1948, Macmillan), p. 266). As it emerged from T'ai Tsung's hands, the imperial college at Si Ngan had a student body of 8,000, of whom 3,260 were residents. T'ai Tsung further increased the Imperial Government's control over its intake of recruits into the imperial civil service by instituting a system of public examinations which was afterwards perfected by the Sung and later dynasties (see Fitzgerald, *op. cit.*, pp. 304, 312, and 381-2).

¹ The nature, genesis, and unhappiness of an intelligentsia have been touched upon in V. v. 154-9.

³ See Mettig, *op. cit.*, p. 412.

² On p. 350, n. 1, above.

⁴ On p. 350, above.

the expense of the Senatorial Order on the one hand and of the imperial freedmen on the other. Nor, perhaps, again, is it an accident that the Roman 'knight' and the English 'gentleman', drawn, as they both were, from an ex-commercial class fumigated with an aristocratic literary culture, should have to yield the palm to a Chinese scholar-administrator educated in an aristocratic philosophy without any skeleton of a commercial past in the cupboard of his family history.

Who are the Beneficiaries?

If we turn now to consider who had been the principal beneficiaries from the imperial civil services that universal states had called into existence for their own purposes, we shall see that the most obvious benefits had been obtained by these empires' non-barbarian successor-states:¹ the Latin American successors of the Spanish Empire of the Indies; the Central and East European successors of the Napoleonic Empire and the Danubian Hapsburg Monarchy; the Soviet Union that had succeeded the Petrine Russian Empire; the two British Dominions—an Indian Union and a Pakistan—that had succeeded the British Indian Rāj; and the indigenous successor-states of the Han Empire in the Yangtse Basin and along the southern seaboard of an expanded Sinic World, where a remnant of the Confucian scholar-administrator class had been able to hibernate until the evocation of a ghost of the Han Empire by the Sui and the T'ang had given this academic Rip van Winkle an opportunity to play his professional part again on the old oecumenical scale in the life of a new Far Eastern Civilization.² A fledgling successor-state that is struggling to establish itself is seldom inhibited by political animosity from taking over from its imperial predecessor a vital administrative technique or even an existing professional personnel that knows how to make the wheels of administration keep on revolving. The British Rāj in India, which was perhaps unique among universal states in having voluntarily liquidated itself, had taken pains during the transitional thirty years 1917-47 to prepare the way for its successors by progressively Indianizing the previously European-manned higher ranks of the Indian civil service, and the Napoleonic French administrators in Central Europe had been equally conscious of having an educational mission, though perhaps not equally aware that it was of the essence of their task to educate their non-French flock to a level of administrative efficiency at which these pupils would be able to do without the services of their blandly self-assured masters.

'If, as Napoleon said, experience is everything in administration, faith also goes for something. The French administrators in Westphalia were not only experienced, but they had faith in their own value. It is only necessary to read the letters of Beugnot or the speeches and circulars of Siméon to see how saturated men can become with the belief in the superiority of the language and civilization of their own country. They

¹ Barbarian hands are seldom gentle and deft enough to make effective use of so subtle and delicate an administrative implement as a professional civil service.

² See p. 357, n. 4, above, and X. ix. 667.

speaking kindly, considerably, condescendingly to the poor Westphalians, explaining everything in the lucid French manner, as a master might expound a beautiful text to a class of stupid and backward boys, now calling attention to a grace of phrase, now to its inner logical coherence, now to its bearing on life. The official letters and documents of this time have all the air of being written by men who regarded themselves as missionaries of Civilisation, and who wish to impart the mysteries of their creed.¹

A characteristic exposition of this condescending outlook is given in the following passage from the pen of an eminent representative of the French missionary-administrator fraternity:

'It was then a position in Europe to be a Frenchman, and it was a great position to represent the Emperor anywhere; save that I should not have abused my office with impunity, I was in Germany what the proconsuls were in Rome. . . . We were at that time under the charm of the Peace of Tilsit, the invincibility of the Emperor had not yet received a wound. I came from Paris, where I had passed my life at his Court, that is to say, in the midst of the memorable works and miracles of his reign. In his councils, I had admired this genius who dominated human thought; I believed that he was born to chain up Fortune, and it seemed to me quite natural that people should be prostrate at his feet. . . . I presented myself in the Grand Duchy [of Berg] under the empire of these ideas. . . . I worked from morn to night with a singular ardour, and astonished the natives of the country, who did not know that the Emperor exerted upon his servants, however distant, the miracle of the Real Presence.'²

This radiation of the demonic influence of Napoleon's personality was as fruitful at long range in raising administrative standards in the Napoleonic Empire's non-French successor-states as it was fatal at short range to the perpetuation of French rule over non-French populations for whom, at close quarters, the upsetting effect of a genially high-handed re-education in the administrator's art decidedly outweighed the stimulus.

While serving the administrative needs of its imperial creators and their successors, a professional civil service may also be performing the historically more important function of propagating a culture. In the minds of Beugnot and his colleagues, their political and cultural missions were manifestly inseparable; and the Western culture that these Napoleonic French missionary-administrators were dispensing, on their own doorstep, to a still semi-medieval Central Europe, was likewise being propagated farther afield, in various forms and divers degrees of maturity, by Spanish administrators in the Central American and Andean worlds; by Austrian administrators among semi-Western Magyars, Croats, and Poles and among Orthodox Christian Rumans, Serbs, and Ukrainians; by Petrine administrators (many of them of Baltic German or other Western origin) in Russian Orthodox Christendom; and by British Indian civil servants (of Indian as well as European

² Beugnot, Count: *Mémoires*, vol. i, pp. 312-13, as translated in Fisher, op. cit., pp. 191-2 (the original French text will be found on pp. 263-4 in the single-volume 3rd ed.: Paris 1889, Dentu).

blood) among the variegated population of a sub-continent. As for the Confucian scholar-administrators who found asylum in the South after the break-up of the Han Empire, they succeeded—during a social interregnum in which the homeland of the moribund Sinic Civilization in the Yellow River Basin was submerged by the influx of barbarian conquerors and of an alien higher religion—in raising a recently incorporated and hitherto backward southern fringe of the Sinic World in its last phase to a cultural level that could compare with that prevailing in the northern focus of the Sinic Civilization under the Han.

The most important beneficiaries from imperial civil services had, however, been neither successor-states nor secular civilizations but churches. In surveying in an earlier chapter the provincial structure of universal states and its after-effects, we have noticed a number of cases in which the hierarchical organization of a church had been based on that of an empire.¹ This basis was provided by 'the New Empire' of Egypt for the Pan-Egyptiac Church that was organized by Thothmes III under the presidency of the Chief Priest of Amon-Re at Thebes; by the Sasanian Empire for the Zoroastrian Church; and by the Roman Empire for the Catholic Christian Church. The ecclesiastical pyramid reproduced the features of its secular model from base to apex. At the summit, the Chief Priest of Amon-Re at Thebes was created in the image of a Theban Pharaoh; the Zoroastrian Chief Möbadh (Möbadhān Möbadh) in the likeness of a Sasanian Shāhīnshāh; the Pope in the likeness of a post-Diocletianic Roman Emperor.² Secular administrative corporations had, however, performed more intimate services for churches than the mere provision of an organizational last. They had also influenced their outlook and *éthos*, and in some cases these intellectual and moral influences had been conveyed, not merely by example and mimesis, but by the social translation of a personality, in whom they had been incarnate, from the secular to the ecclesiastical sphere.

Three historic figures, who each gave a decisive turn to the development of the Catholic Church in the West, were recruits from the secular Roman imperial public service. Ambrosius (*vivebat circa* A.D. 340-97) was the son of a civil servant who had reached the peak of his profession by attaining the office of praetorian prefect in the Gauls; and the future Saint Ambrose was following in his father's steps as a young and promising governor of the two North Italian provinces of Liguria and Aemilia when in A.D. 374, to his astonishment and consternation, he was dragged out of the rut of an assured official career and was hustled into the episcopal see of Milan by a popular impetus that did not wait to ask his leave. Flavius Magnus Aurelius Cassiodorus Senator (*vivebat circa* A.D. 490-585) spent his working life on the thankless—and, as his colleague Boethius's fate proved, perilous—task of administering a Roman Italy in the service of a barbarian war-lord. It was only after his retirement from secular public life that Cassiodorus found a creative use for a literary archaism that had been an impediment to his draftsmanship as

¹ See pp. 188-93, above.

² See Toynbee, J. C. M.: 'Catholicism and the Roman Imperial Cult', in *The Month*, vol. clviii, November 1931, pp. 390-2.

a Minister of State. In his latter days he turned a rural property of his in the toe of Italy—the Vivarium, in the district of Squillace—into a monastic settlement that was the complement of Saint Benedict's foundation at Monte Cassino. Saint Benedict's school of monks broken-in, by the love of God, to hard physical labour in the fields¹ could not have done all that it did do for a nascent Western Society if it had not been wedded, at the start, to a Cassiodoran school that was inspired by the same motive to perform the mentally laborious task of copying the Classics and the Fathers.² As for Gregory the Great (*vivebat circa* A.D. 540–604),³ he abandoned the secular public service, after serving as *Praefectus Urbi*, in order to follow Cassiodorus's example by making a monastery out of his ancestral palace in Rome, and he was thereby led, against his expectation and desire, into becoming one of the makers of the Papacy.

After citing the names of these three great luminaries, we may single out, among the lesser lights, two country gentlemen, Gaius Sollius Modestus Apollinaris Sidonius of Auvergne (*vivebat* A.D. 430–83) and Synesius of Cyrene (*vivebat* A.D. 370–415), who were both drawn out of a life of innocent but uncreative literary dilettantism when their local countryside was engulfed in the oecumenical catastrophe of their age. Both of them responded nobly to this personal challenge by taking on their shoulders the burdens, anxieties, and perils of local leadership; and each found that he could best perform an arduous duty, that he would not shirk, by allowing himself to be made bishop of his local community.⁴

Diverse as the origins and histories of these five personalities were, they had four things in common. For all of them except, perhaps, Cassiodorus, their ecclesiastical career went against the grain. Ambrose was aghast at being made a bishop, while Synesius and Sidonius half-whimsically acquiesced in a role which evidently struck them as being, to say the least, incongruous. Gregory was as reluctant to be made seventh deacon, apocrisiarius, and pope, and even to become abbot of his own monastery, as he had been eager to enrol himself as an ordinary monk. The second common feature in these five ecclesiastical careers was that all these *ci-devant* lay notables were constrained, willy-nilly, to employ their secular administrative gifts and experience in the Church's service. In the third place, they found a scope for the use of this mundane faculty in the ecclesiastical field which they had not found in secular life.⁵ And, finally, they eclipsed their own performance as ecclesiastical administrators by their prowess on the spiritual plane.

Thus, when the break-up of the universal state for whose administrative service they had been educated had deprived these Roman *honestiores* of the possibility of following secular public careers, they responded to this formidable challenge by entering the service of the Christian Church and devoting all their powers to assisting in the creation of a new order of society. An instructive contrast is presented

⁴ Synesius was made metropolitan bishop of the Cyrenaic Pentapolis *circa* A.D. 410; Sidonius was made bishop of Auvergne in A.D. 469 or 470.

⁵ See IV. iv. 55.

by the very different reaction of their Sinic counterparts. Under the same ordeal the Confucian scholar-administrator did not paradoxically save his life by losing it;¹ he kicked obstinately against the pricks;² he put up a stouter fight than the Roman civil servant against overwhelmingly powerful forces of disintegration;³ he declined to confess that 'we have no armour against Fate'; and, if he can be said to have performed any service at all for any church, it was the negative and unintentional service of leaving to Buddhist scholar-monks and Taoist philosopher-medicine-men the thankless task of carrying on a secular administration for the Eurasian Nomad war-lords of the defunct Han Empire's barbarian successor-states.

'The fall of the Han Empire, and the partitions and barbarian invasions which followed, opened the road to Buddhism and effected a religious revolution which was the most significant development in what the historians of Confucian tradition describe as an "Age of Confusion". . . . The northern Tatar dynasts extended their favour to Buddhist monks in the conquered provinces. The Confucian scholars had for the most part fled south when Loyang fell [in A.D. 311]. Those who remained in the North were not favoured by the invaders, who rightly suspected this class of secret loyalty to the Chinese Emperor and hostility to the new conquerors. The new sovereigns, needing the assistance of a literate class, found in the Buddhists and Taoists, who had been the opponents of the orthodox Confucians, a body of scholarly men who were trustworthy and loyal. . . . In A.D. 405⁴ the [Confucian] historians confess that nine out of every ten families in the northern empire had embraced the Buddhist faith. The proportion is significant, for the non-Buddhist tenth fairly represents the educated class of Confucian scholars and Taoist sectaries who alone remained detached from the new religion. . . . A hundred years later, in A.D. 500, it is admitted that the whole of China, North and South alike, was Buddhist. . . . A few Confucian scholars refused for themselves the salvation which their own families, and particularly the women, eagerly embraced.'⁵

For this uncreative obstinacy, the epigoni of the Han imperial civil service had their reward.⁶ Though, by the end of the interregnum between the disappearance of the Sinic and the emergence of an affiliated Far Eastern Civilization, 'the Han civil service based on scholarship was almost forgotten',⁷ the Confucian scholar never abdicated. The tide was running all against him, for

'these melancholy conditions and the apparently incurable anarchy of the times tended to encourage the progress of Buddhism. . . . The doctrines

² Acts ix. 5 and xxvi. 14.

³ In the last phase of the dissolution of the Han Empire, in A.D. 166, the Confucian civil servants founded an association for combating the pernicious influence of the eunuchs, and thereby drew down upon themselves a crushing counterstroke in A.D. 168, partly because they were not sufficiently adaptable to succeed in co-operating with the fighting service, even in this supreme common cause (see Fitzgerald, *op. cit.*, pp. 248-9).

⁴ According to Sir Charles Eliot: *Hinduism and Buddhism* (London 1921, Edward Arnold, 3 vols.), vol. iii, p. 250, this religious landslide in the North of a disintegrating Sinic World had already taken place by the year A.D. 381.—A. J. T.

of the new religion offered comfort to men living in a world of violence and instability. To renounce society, abandon possessions, and seek peace in a monastery among the mountains became the fashion among thoughtful men. Those who could not take the extreme step contributed to the building of temples and pagodas and their enrichment with artistic treasures.¹

If, in these psychologically propitious circumstances, Buddhism eventually failed after all to anticipate Christianity's triumphant success in making the future decisively her own, the explanation lies in the Confucian scholar's feat of holding out in a situation in which the Roman civil servant at last despaired of the republic.

The Confucian civil service produced no Buddhist or Taoist equivalent of an Ambrose or a Gregory the Great. So far from giving the Buddhist Church wings to fly with, it sullenly bided its time for clipping the wings that she had.

'Even at the height of Buddhist fervour, the political power remained in the hands of laymen who were Confucian in training, even if Buddhist in sympathy and the practice of daily life.'²

The Confucian scholar's monopoly of a literary culture that was indispensable for the practice of a latter-day Sinic administrative technique, in combination with his cult of a family solidarity which was as close-knit as it was narrow-hearted, armed him with two weapons that enabled him not only to retain his power in the South but actually to recover it in the North by eventually establishing his ascendancy over the epigoni of the barbarian conquerors.³ By the persistent exercise of these prosaic arts at the price of closing his eyes to the vision of an Other World which the disintegration of his own world might have revealed to him, the Confucian scholar lived to achieve in the end his blinkered mundane ambition of reanimating a defunct universal state with which he had come to identify his own existence so completely that he had ceased to be able to imagine the possibility of felicity in any other social setting.

3. *Citizenships*

The Initial Gulf between Subjects and Rulers

Since a universal state usually arises in the first instance⁴ from the forcible unification of a number of contending parochial states at the end of a Time of Troubles in the history of a disintegrating civilization, it is apt to start life with a great gulf fixed between rulers and ruled. On the one side of this sharp political dividing line stands an empire-building community representing the survivors of a dominant minority in a protracted struggle for existence between the rulers of the com-

¹ Fitzgerald, op cit., p. 259.

² Ibid., p. 286.

³ An illuminating study of the Confucian recovery in the North, in which the evidence latent in the official records of the *ci-devant* barbarian To Pa dynasty is extorted by a brilliant use of 'third-degree' statistical methods, will be found in Eberhard, W.: *Das Toba-Reich Nord Chinas* (Leiden 1949, Brill).

⁴ In contrast to the re-establishment of a universal state after a break caused by the intrusion of an alien civilization, as, for example, 'the Middle Empire' of Egypt was re-established in the shape of 'the New Empire,' the Achaemenian Empire in the shape of the Arab Caliphate, and the Maurya Rāj in the shape of the Gupta Rāj.

peting local communities of the preceding age; on the other side lies a conquered population which, in spite of a superiority in numbers that may be very great, finds itself militarily and politically at the mercy of its conquerors. This standard initial political pattern can be detected even in the history of the Ottoman Empire, which afterwards followed the singular course of excluding the free 'Osmanli imperial people themselves from political power in favour of professional slaves recruited from among their subjects and their neighbours. It is also common form—as can be observed in the subsequent history of the Ottoman Empire as well as in the careers of universal states of the standard type—for the effectively enfranchised element in the body politic¹ of a universal state to become, as time goes on, a relatively larger fraction of the total population as a result of the admission of recruits from the subject majority. It had, however, been unusual, in the universal states that had come into existence up to date, for this process to go to the length of completely obliterating the initial division between rulers and ruled by enfranchising politically the whole of the originally subject element.

The Obliteration of the Gulf by the Statesmanship of Han Liu Pang

The outstanding instance in which a comprehensive political enfranchisement had been achieved—and this within a quarter of a century of the foundation of the universal state—was in the Sinic World. In the Sinic universal state established in 230–221 B.C. through the conquest of six other parochial states by their victorious competitor Ts'in, the supremacy of Ts'in was brought to an end when Hsien Yang, the capital of the Ts'in Power, was occupied by Liu Pang in 207 B.C. and was sacked by Hsiang-yü in 206 B.C.² The political enfranchisement of the whole population of a Sinic universal state that had collapsed after Ts'in She Hwang-ti's death and had been restored by Han Liu Pang may be dated from the ordinance of 196 B.C.³ in which the first Han emperor directed that candidates for posts in the imperial civil service should be selected by merit. Though this political act did not, and could not, change at a stroke the fundamental economic and social structure of the Sinic Society, it was, as we have seen, revolutionary in its effects on the political plane. The Sinic Society continued, it is true, to consist of a mass of tax-paying peasantry supporting a small privileged ruling minority, but henceforward the avenue giving entry into the Sinic political paradise was genuinely open to talent, in the sense that admission was no longer confined either by a national restriction to inhabitants of the former state of Ts'in or by a class restriction to scions of the former Sinic hereditary nobility.

The historical explanation of this exceptionally rapid and thoroughgoing political enfranchisement of the originally subject population of a Sinic universal state is to be found in the previous destruction of a

¹ In the Greek terminology of Hellenic political science the meaning of this clumsy English periphrasis is accurately conveyed by the single word *πολίτευμα*.

² See pp. 211–12, above.

³ See p. 355, above

former monopoly of political power in the hands of the Sinic hereditary nobility. This was accomplished, as we have seen, in the State of Ts'in through the reforms introduced by Lord Shang in the fourth century B.C.,¹ and in the rest of the Sinic World after 221 B.C. through still more drastic measures on the part of Ts'in She Hwang-ti.² The sequel indicates that Ts'in She Hwang-ti did his work less effectively than Lord Shang had done his; for there appears to be no record that Han Liu Pang ever had to reckon with attempts on the part of the people of Ts'in to recapture for their state the political dominion over the rest of the Sinic World which, after striving for it for a hundred years, Ts'in had held from 221 B.C. to 207 B.C.—though, if any sense of disappointed imperialism had been alive in the Ts'in people's hearts, it would assuredly have been inflamed by the experience of coming under the rule of a foreign usurper whose home country lay at the farther extremity of the region 'outside the passes', in the borderland between the former territories of Ts'in's conquered rivals Ts'i and Ch'u. The politically dangerous nostalgia for the past that gave Han Liu Pang anxiety was cherished by the dynasties and aristocracies of the former parochial states 'outside the passes' whose hereditary authority their conqueror Ts'in She Hwang-ti had done his utmost to eradicate. To forestall a second outburst, in these quarters, of the political explosion that had shattered the work of Ts'in She Hwang-ti was the main object of Han Liu Pang's carefully planned face-saving policy.

Han Liu Pang's choice of a territory for his own imperial demesne would hardly have fallen on the former parochial domain of Ts'in solely on the ground of the strategic strength of 'the Country within the Passes' unless he had felt the local population to be amenable to his rule; and for this he could hardly have counted on their gratitude to him for his clemency in 207 B.C.—even though this had been thrown into relief by the atrocities committed in Ts'in by Hsiang-yü in the following year. There must be some further explanation of the amenability which the people of Ts'in manifestly displayed in these apparently provocative circumstances, and we may perhaps find the explanation in the political annihilation of the nobility in Ts'in to the profit of the Crown more than a hundred years earlier. This concentration of power in the Crown's hands had made the people of Ts'in a formidably pliant military instrument for the overthrow of all the other parochial states in a war to the death; but it had given the state this military predominance at the cost of depriving it of the political vitality embodied in an experienced and self-conscious aristocracy; and accordingly, when the legitimate hereditary dynasty, in its turn, was extinguished in 207 B.C., the people of Ts'in were left as sheep without a native shepherd, at the mercy of the first competent stranger to arrive on the scene and round them up. The combined effect of Lord Shang's revolutionary work 'inside the passes' and Ts'in She Hwang-ti's outside them would seem to account for Han Liu Pang's success in obliterating, within the span of a single generation, the dividing line between rulers and ruled in the Sinic universal state.

¹ See p. 351, above.

² See p. 352, above.

The Inefficacy of a merely Juridical Enfranchisement

The unifying effect produced by living historical forces, operating over a long period of time, cannot be reproduced by the mere formality of conferring a uniform juridical status. The uniform status of Europeans, Eurasians, and Asiatics under the British Rāj in India, and of Europeans, Creoles, and 'Indians' in the Spanish Empire of the Indies, as subjects, in either case, of one Crown, did not have any appreciable practical effect in diminishing the gulf between rulers and ruled in either of these polities. In the Danubian Hapsburg Monarchy, on the other hand, the common allegiance of the divers religious and national communities to one dynasty, and the opening of careers in the Emperor-King-Archduke's service to talent, wherever this might be forthcoming among the Hapsburg monarch's motley collection of subjects, might in time have had the same effect as the same cause in the Han Empire, if in the Danubian Monarchy the tendency towards political equality had not been overtaken and reversed in the last chapter of its history by a nationalism, derived from Western Europe, which eventually split the Monarchy into pieces.¹ The classical instance in which an initial gulf between rulers and ruled was successfully obliterated by a gradual merger of a once privileged ruling minority in the mass of its former subjects is to be found in the history of the Roman Empire, and here, too, as we have seen,² the substance of political equality was not communicated by the mere conferment of the juridical status of Roman citizenship. After the promulgation of the *Constitutio Antoniniana* in A.D. 212 all inhabitants of the Roman Empire were Roman citizens with the possible exception of an inconsiderable residue of *dediticii*; yet, after that, it still required the political and social revolution of the third century of the Christian Era to bring the realities of life into conformity with the law, because the effective governing element (*πολίτευμα*) under the Principate had not been coextensive with the Roman citizen body, but had been a narrower oligarchy whose privileges had survived the progressive extension of the status of Roman citizenship to former Roman subjects.

Imperial Citizenships and Ecclesiastical Allegiances

The ultimate beneficiary from the political egalitarianism towards which the Roman Empire was moving in the Age of the Principate and at which it arrived in the time of Diocletian was, of course, the Catholic Christian Church, and this in more than one way.

In the first place, the Catholic Church borrowed the Roman State's master institution of dual citizenship—a constitutional device that had solved the technical and psychological problem of how to enjoy the advantages of membership in an oecumenical community without having to repudiate narrower loyalties or to cut local roots.³ In the Roman Empire under the Principate, which was the political framework within which the Christian Church grew up, all citizens of the world-city of Rome, except a small minority whose ancestral domicile was the

¹ See II. ii. 182-6.

³ See IV. iv. 307-14.

² On pp. 152-8, above.

metropolis itself or its immediate environs, were also citizens of some local municipality that, though within the Roman body politic, was an autonomous city-state with the traditional Hellenic form of city-state self-government and the traditional hold of such a local motherland upon the affections of her children. On this Roman secular model a growing and spreading Christian ecclesiastical community built up an organization and a corporate feeling that was both local and oecumenical. The Church to which a Christian gave his allegiance was both the local Christian community of a particular city-state and the Catholic Christian community in which all these local churches were embraced in virtue of a uniform practice and doctrine and a perpetual intercourse through which they kept in touch and in step with one another.

The Catholic Church became, in another sense, a beneficiary of the Roman Empire in its post-Diocletianic phase when—after the conversion of Constantine to Christianity had been followed by Theodosius's proscription of all non-Christian religions¹ except Judaism—the terms 'Catholic Christian' and 'Roman citizen' became almost interchangeable. The politico-ecclesiastical equation thus established in the Roman Empire towards the close of the fourth century of the Christian Era reappeared in the constitutions of those 'ghosts' of the Roman Empire that were afterwards conjured up in Western and in Orthodox Christendom. In the medieval 'Holy Roman Empire', and even in the modern Danubian Hapsburg Monarchy, at least down to the Austro-Hungarian *Ausgleich* of A.D. 1867, it was hardly possible to be a fully approved and privileged subject of the Imperial Crown without at the same time being a Roman Catholic Christian, while in the East Roman Empire and in the Russian Empire, even in its post-Petrine phase, full membership in the political community could hardly be enjoyed without a profession of Eastern Orthodox Christianity. In A.D. 1952 a philological fossil of this once living state of politico-religious affairs was still preserved in the Modern Greek appellation *Rōmyós*, to which an unsophisticated Greek peasant or a hyper-sophisticated cultivator of the vulgar tongue would answer rather than to the artificially revived name *Hellén* with which he would have been indoctrinated at school. Though *Rōmyós*, in the philologist's ear, merely rang a slight change on the Ancient Greek word '*Ῥωμαῖος*', it had long since ceased, on the lips of its Modern Greek users, to mean 'Roman' in the historical sense. It had come to mean an Orthodox Christian whose mother tongue was Modern Greek and whose true fatherland was an ideally still existing East Roman Empire with its capital at Constantinople.²

In the convergent histories of the Roman Empire and the Catholic Christian Church, the Roman citizen body and the Christian ecclesiastical community had made their *rapprochement* from entirely different origins in extremely diverse social and cultural milieux; and, though, at an early date in the history of Christianity, they had acquired an outstandingly important common member in the person of Saint Paul, they did not coalesce until the Christian Church was nearly four hundred, and the Roman State more than a thousand, years old. In the histories

¹ See IV. iv. 226-7.

² See pp. 29-31, above.

of the Arab Caliphate and the Sunnī form of Islam, the higher religion that was eventually to be embraced by all but a remnant of the population of the universal state was associated from the outset with the imperial people; and, so far from converging—as the Catholic Christian Church and the Roman citizen body converged, to the point of eventual coalescence—by extending their membership from opposite quarters to include by degrees almost the whole population of the state, the imperial people and the Islamic community ceased to be coextensive as Islam proceeded to convert the Primitive Muslim Arab empire-builders' non-Arab subjects. The revolution that carried the 'Abbasids on to the imperial throne of the Caliphate in place of the Umayyads corresponded, as we have seen,¹ to the revolution in the Roman Empire in the third century of the Christian Era in breaking down a previous political barrier between a dominant minority and a subject majority. Since, however, in the pre-'Abbasid Caliphate, the ruling element had been distinguished from its subjects, not by a secular citizenship to which non-citizens could be admitted by naturalization, but by the incommunicable physical heritage of Arab descent and by a communicable religious allegiance to Islam that did not give a non-Arab convert Arab status,² the effect of the 'Abbasid revolution was to open the way towards egalitarianism in the Caliphate, not by making Arabs as well as Muslims out of an increasing number of the Caliphate's non-Arab subjects, but by substituting the Muslim for the Arab community as the imperial people.³ Thus in the Caliphate, in contrast to the Roman Empire, the political distinction between rulers and ruled was eventually effaced by their merger, not in both a common citizenship and a common religion, but in a common religion alone. In the Caliphate an oecumenical faith had to do duty for an oecumenical citizenship as well.

The role of Islam in the Caliphate in the last phase of the history of the Syriac Civilization recurs in the histories of the Mughal Rāj and the Ottoman Empire, in which Muslim empire-builders imposed universal states on the Hindu World and on Orthodox Christendom respectively. In both these cases, Islam once again served as a unifying and a levelling political force.

In the Ottoman Empire after the death of Suleymān the Magnificent the free Muslim community, who for the best part of two centuries past had been paradoxically excluded from a share in the government, were stimulated by a sense of the incongruity between their profession of Islam and their unfavourable political status into wresting out of the hands of the Pādishāh's infidel-born Slave-Household its monopoly of political power. In the Mughal Rāj, which developed only the rudiments of a counterpart of the 'Osmanlis' 'peculiar institution',⁴ no revolution

¹ On pp. 147–52, above.

² The most that could be communicated to a non-Arab subject of the pre-'Abbasid Caliphate who embraced Islam and sought to associate himself with an Arab patron was a relation of clientship that was an intolerably inferior status compared with that of the Arab imperial people itself.

³ The deposition of the Arabs from their former political supremacy in the Caliphate as a result of the fall of the Umayyads was comparable to the deposition of the people of Ts'in from their supremacy in the Sinic World as a result of the fall of the Ts'in Dynasty.

⁴ See III. iii. 31, n. 1.

was needed in order to merge the Transoxanian Turkī henchmen of the Timurid imperial house with their fellow Muslims who had made their way into India before them or who came in afterwards from Central Asia or Iran to reinforce them.

In the Caliphate, the Ottoman Empire, and the Mughal Empire alike, Islam also brought recruits to the imperial people in the form of converts from the non-Muslim subject population, but failed to drive rival religions entirely off the field, as Christianity virtually succeeded in superseding its rivals in the Roman Empire; and for this difference in the outcome we can see two reasons. One is that Islam had to contend with higher religions—Zoroastrianism and Orthodox, Monophysite and Nestorian Christianity in the Caliphate; Hinduism in the Mughal Rāj; Orthodox Christianity in the Ottoman Empire—which were all already well established before Islam's advent, whereas Christianity in the Roman Empire had better chances. She was running a neck-and-neck race with coeval higher religions which, like her, had still to establish their positions, while the older religions that were already established in the Hellenic World of that age had no chance of holding their own against any higher religion that might enter the lists against them, since they were worships either of a Non-Human Nature who had been deprived of her prestige by Man's establishment of his mastery over her, or of some parochial human community which had lost its prestige in losing its sovereign independence. Islam's second handicap, by comparison with Christianity, was its honourable obligation, under one of its own articles of faith, to grant toleration to other 'Peoples of the Book' so long as they accepted Muslim political supremacy and gave practical proof of their acceptance of it by paying tribute; and, though, on a strict interpretation of the Islamic Law (*shari'ah*), the Jews and Christians were the only sects that were entitled to claim this status, the same privileges were accorded in practice to both Zoroastrians and Hindus,¹ partly perhaps, owing to an intuitive perception that their faiths, too, were 'higher religions', and partly, no doubt, on account of the sheer political impracticability of proscribing any religion that commanded the allegiance of the solid mass of a numerous subject population—which was the position of Hinduism in the Mughal Rāj in India and of Zoroastrianism in the eastern provinces of the Caliphate down to at least the ninth century of the Christian Era.

While these handicaps were operative in all the three cases under consideration, there was a notable difference in the extent of Islam's success in the conversion of non-Muslim subject populations in the Caliphate on the one hand and in the Mughal and Ottoman empires on the other. In the Caliphate, by the time of the extinction of the last lingering shadow of the 'Abbasid Power by the Mongols in A.D. 1258, the process of conversion had gone so far—particularly during the last two or three centuries, under the spur of successive Eurasian Nomad barbarian invasions—that the non-Muslim residue in the population had been reduced to a numerically insignificant minority.² In the Otto-

¹ See IV. iv. 225-6; V. v. 674, n. 2; and V. vi. 204-5.

² For the process, see, further, Tritton, A. S.: *The Caliphs and their Non-Muslim*

man Empire and the Mughal Rāj the corresponding missionary activity never made a comparable impression on the non-Muslim mass, and in both states the process was arrested in the course of the seventeenth century of the Christian Era by an increase in the vigour and confidence of the reaction of the Orthodox Christian and the Hindu subject population respectively.

The explanation of this marked difference in results is probably to be found in differences on the non-Muslim side in this competition between Islam and rival faiths. Among Islam's rivals in the Caliphate, Zoroastrianism and Orthodox Christianity had forfeited their popular appeal through their adoption by the Sasanian and Roman Imperial governments as established official religions.¹ The Nestorian Christians in the ex-Sasanian provinces and the Monophysite Christians in the ex-Roman provinces were not disposed to resist a change of masters when their former Zoroastrian and Melchite oppressors were deposed by the Primitive Muslim Arabs, though they were slow to adopt Islam themselves in place of faiths which they had originally embraced of their own accord and not under compulsion. This divided religious opposition to Islam in the Caliphate was evidently less difficult to overcome than the united front that Hinduism opposed to it in the Mughal Rāj and Orthodox Christianity in the Ottoman Empire. In the contest between Islam and Orthodox Christianity for the spiritual allegiance of the Ottoman *ra'īyeh* the scales were eventually weighted against Islam by the impact of Western Christendom after the tide of war between the 'Osmanlis and the Western Powers had begun to flow in favour of the West. This change in military fortunes lowered the prestige of Islam in the Orthodox Christians' eyes and inspired them with the new ideal of remoulding themselves in the cultural image of their heterodox Western co-religionists.² The West had impinged on India likewise before Awrangzīb's abandonment of the Islamic tradition of toleration evoked a militant Hindu counter-attack, but in this case Islam's arrest must be ascribed to an error in Mughal statesmanship and not to any influences emanating from Western onlookers who, in India at this date, had not yet acquired prestige by a display of their military strength.

These considerations on oecumenical citizenships, ecclesiastical and secular, conclude our survey of universal states—an institution whose evil genii had been the Ts'ing She Hwang-tis and its good genii the Han Liu Pangs.

Subjects (London 1930, Milford), and Browne, L. E.: *The Eclipse of Christianity in Asia from the Time of Muhammad till the Fourteenth Century* (Cambridge 1933, University Press).

VII

UNIVERSAL CHURCHES

A. ALTERNATIVE CONCEPTIONS OF THE RELATION OF UNIVERSAL CHURCHES TO CIVILIZATIONS

(I) CHURCHES AS CANCERS

IN entering now upon our study of universal churches we may find it convenient to start by examining their relation to the social environment in which they arise.

We have seen that a universal church is apt to come to birth during a Time of Troubles following the breakdown of a civilization, and to unfold itself within the political framework of a universal state which is the institutional manifestation of a temporary arrest in a broken-down civilization's decline and fall. Our study of universal states has brought out two facts about them:¹ first that, in so far as their achievements bear fruit, the harvest is apt to be reaped, not by the sowers themselves, but by alien hands; and, second, that, in so far as they become creative in this indirect, second-hand, vicarious way, through the creative acts of their alien beneficiaries, they are creators unintentionally and indeed against their will. Their own primary aim is, not to be creative, but to survive, and the experience of losing their lives in order to find them again in the lives of their beneficiaries does not reconcile them to their fate; it provokes them to recalcitrance and indignation. Our survey in the preceding Part of this Study has shown that the principal beneficiaries of universal states are universal churches; and it is therefore not surprising that the champions of a universal state, at a stage in its history at which its own fortunes are manifestly on the wane, should dislike the spectacle of a universal church within its bosom profiting by services that the universal state is continuing to render without any longer being able to turn them to its own benefit. The church is therefore likely at first sight to wear the appearance of a social cancer; for in this situation and state of mind the universal state's devotees are apt, not merely to observe and resent the fact that the church is increasing while the state decreases,² but to take it for granted that the beneficiary is also a parasite, and that the patent profit which it draws from its host is the cause of the host's malady. This diagnosis is as attractive as it is exacerbating; for it is always easier, both intellectually and morally, to debit one's ills to the account of some outside agency than to ascribe the responsibility to oneself.

In the decline of the Roman Empire an indictment of the Christian Church, which had been mounting up since the firing of the first telling

¹ See Part VI, *passim*, above.

² John iii. 30.

shot by Celsus (*scribebat circa* A.D. 178), came to a head in the West when the Empire was in its death agonies there. An explosion of this hostile feeling was evoked in A.D. 416, in the heart of a 'die-hard' pagan Gallic devotee of Imperial Rome,¹ by the sad sight of desert islands colonized—or, as Rutilius would have expressed it, infested—by Christian monks:

Processu pelagi iam se Capraria tollit.
squalet lucifugis insula plena viris.
ipsi se monachos Graio cognomine dicunt,
quod soli nullo vivere teste volunt. . . .
quaenam perversi rabies tam stulta cerebri,
dum mala formides, nec bona posse pati?²

Rutilius's impersonal hostility towards the monks of Capraia was, however, a less painful feeling than the pang which, before his voyage was over, he was to suffer at the sadder sight of another island that had captivated a fellow countryman and acquaintance of the poet's own.

Adsurgit ponti medio circumflua Gorgon
inter Pisanum Cyraicumque latus.
aversor scopulos, damni monumenta recentis:
perditus hic vivo funere civis erat.
noster enim nuper iuvenis maioribus amplis,
nec censu inferior coniugiove minor,
impulsus furiis, homines terrasque reliquit,
et turpem latebram credulus exul adit.
infelix putat illuvie caelestia pasci,
seque premit laesis saevior ipse deis.
num, rogo, deterior Circaeis secta venenis?
tunc mutabantur corpora, nunc animi.³

Through these lines there breathes the spirit of a still pagan aristocracy in the dissolving western provinces of the Roman Empire who saw the cause of the ruin of the body politic in the abandonment of the traditional worship of the Hellenic pantheon by pagan converts to Christianity and in the suppression of Paganism by the Christian Emperor Theodosius.⁴

This controversy between a sinking Roman Empire and a rising Christian Church raised an issue of such deep and general interest that it had stirred the feelings, not only of contemporaries directly concerned, but of a Posterity contemplating this historical spectacle across a great gulf of time and change. In the statement 'I have described the triumph of Barbarism and Religion',⁵ Gibbon not only sums up the seventy-one chapters of his book in nine words but proclaims himself a partisan of

¹ The most striking of Rutilius Namatianus's expressions of this devotion have been quoted in V. v. 345-7.

² Rutilius Namatianus, C.: *De Reditu Suo*, Book I, ll. 439-42 and 445-6.

³ Rutilius, Book I, ll. 515-26.

⁴ It was, of course, in answer to this pagan thesis that Saint Augustine wrote his *De Civitate Dei* (see V. v. 225, n. 1 and XIII. x. 88-89).

⁵ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. lxxi, quoted in the present Study in IV. iv. 58. Cp. Pope: *An Essay on Criticism*, ll. 692-3:

'A second deluge Learning thus o'er-run,
And the Monks finish'd what the Goths begun.'

Celsus and Rutilius; and we can divine that, in his eyes, the cultural peak, as he saw it,¹ of Hellenic history in the Antonine Age stood out clear across an intervening span of sixteen centuries which, for Gibbon, was a cultural trough. Out of the miry clay² of this slough, the generation of Gibbon's grandfather in the Western World had tardily gained a footing on the slopes of another mountain, and from this point of vantage the twin peak was once again visible in all its majesty.³ 'On the morrow of the death of the Emperor Marcus,' we seem to hear Gibbon saying to himself, 'the Roman Empire, as I have described it in its glory,⁴ went into its decline. On the standards of value that I, Gibbon, and my kind in my world share with our kindred spirits in the world of Tacitus and Hadrian, a depreciation of values then set in, and this in every province of life. Religion and Barbarism triumphed, and this lamentable state of affairs continued to prevail for hundreds and hundreds of dreary years, until only the other day, no longer ago than the close of the seventeenth century, a rational civilization began to emerge again.'

This view, which is subtly implicit in Gibbon's work, has been put clearly and sharply⁵ by a twentieth-century Western anthropologist who is a figure of comparable stature in his own field:

'The religion of the Great Mother, with its curious blend of crude savagery with spiritual aspirations, was only one of a multitude of similar Oriental faiths which in the later days of paganism spread over the Roman Empire, and by saturating the European peoples with alien ideals of life gradually undermined the whole fabric of ancient civilisation.

¹ Gibbon's view on this point has been criticized in the present Study, IV. iv. 59-63.

² Psalm xl. 2.

³ The writer owes the following valuable note to his friend and colleague Mr. Martin Wight, who was so kind as to read the draft of Part VII of this Study in typescript:

'This conception of the Middle Ages is discussed, with interesting illustrations, by W. P. Ker in his *The Dark Ages* (Edinburgh 1904, Blackwood), pp. 1-4. He quotes the most explicit and refined statement of the Gibbonian view that I have come across, in a passage from James Cotter Morison (the Victorian biographer of Gibbon, Macaulay and Saint Bernard):

"The Graeco-Roman world had descended into the great hollow which is roughly called the Middle Ages, extending from the fifth to the fifteenth century, a hollow in which many great, beautiful, and heroic things were done and created, but in which knowledge, as we understand it, and as Aristotle understood it, had no place. The revival of learning and the Renaissance are memorable as the first sturdy breasting by Humanity of the hither slope of the great hollow which lies between us and the Ancient World. The modern man, reformed and regenerated by knowledge, looks across it and recognises on the opposite ridge, in the far-shining cities and stately porticoes, in the art, politics and science of Antiquity, many more ties of kinship and sympathy than in the mighty concave between, wherein dwell his Christian ancestry, in the dim light of scholasticism and theology."—J. C. Morison: *The Service of Man: an Essay towards the Religion of the Future* (London 1887, Kegan Paul, Trench), pp. 177-8.'

⁴ e.g. in the opening passage of his work, quoted in the present Study, IV. iv. 58.

⁵ Mr. Martin Wight points out that 'the same conception is artlessly revealed by Dr. Arnold, when discussing his plans for a course of lectures after having been appointed to the Chair of History at Oxford:

"I had thought of trying to do for England what Guizot began so well for France: to start with the year 1400, and make the first year's course comprise the 15th century. My most detailed historical researches happen to have related to that very century, and it gives you the Middle Ages still undecayed, yet with the prospect of daybreak near. I could not bear to plunge myself into the very depths of that noisome cavern, and to have to toil through centuries of dirt and darkness."—Letter to Stanley, 29th September, 1841, in A. P. Stanley: *Life & Correspondence of Thomas Arnold*, 11th edition (London 1880, Murray), vol. ii, p. 239.'

'Greek and Roman society was built on the conception of the subordination of the individual to the community, of the citizen to the state; it set the safety of the commonwealth, as the supreme aim of conduct, above the safety of the individual whether in this world or in a world to come. Trained from infancy in this unselfish ideal, the citizens devoted their lives to the public service and were ready to lay them down for the common good; or, if they shrank from the supreme sacrifice, it never occurred to them that they acted otherwise than basely in preferring their personal existence to the interests of their country. All this was changed by the spread of Oriental religions which inculcated the communion of the soul with God and its eternal salvation as the only objects worth living for, objects in comparison with which the prosperity and even the existence of the state sank into insignificance. The inevitable result of this selfish and immoral doctrine was to withdraw the devotee more and more from the public service, to concentrate his thoughts on his own spiritual emotions, and to breed in him a contempt for the present life which he regarded merely as a probation for a better and an eternal. The saint and the recluse, disdainful of earth and rapt in ecstatic contemplation of heaven, became in popular opinion the highest ideal of humanity, displacing the old ideal of the patriot and hero who, forgetful of self, lives and is ready to die for the good of his country. The earthly city seemed poor and contemptible to men whose eyes beheld the City of God coming in the clouds of heaven.

'Thus the centre of gravity, so to say, was shifted from the present to a future life, and, however much the other world may have gained, there can be little doubt that this one lost heavily by the change. A general disintegration of the body politic set in. The ties of the state and of the family were loosened: the structure of society tended to resolve itself into its individual elements and thereby to relapse into barbarism; for civilisation is only possible through the active cooperation of the citizens and their willingness to subordinate their private interests to the common good. Men refused to defend their country and even to continue their kind. In their anxiety to save their own souls and the souls of others, they were content to leave the material world, which they identified with the principle of evil, to perish around them. This obsession lasted for a thousand years. The revival of Roman Law, of the Aristotelian philosophy, of ancient art and literature at the close of the Middle Ages marked the return of Europe to native ideals of life and conduct, to saner, manlier views of the world. The long halt in the march of civilisation was over. The tide of Oriental invasion had turned at last. It is ebbing still.'¹

¹ Frazer, Sir J. G.: *The Golden Bough: Adonis, Attis, Osiris: Studies in the History of Oriental Religion*, 2nd ed. (London 1907, Macmillan), pp. 251-3. The judgement expressed in this passage is qualified, without being retracted, by the author in the following footnote:

'To prevent misapprehension I will add that the spread of Oriental religions was only one of many causes which contributed to the downfall of ancient civilisation. Among these contributory causes a friend, for whose judgement and learning I entertain the highest respect, counts bad government and a ruinous fiscal system, two of the most powerful agents to blast the prosperity of nations, as may be seen in our own day by the blight which has struck the Turkish Empire. It is probable, too, as my friend thinks, that the rapid diffusion of alien faiths was as much an effect as a cause of widespread intellectual decay. Such unwholesome growths could hardly have fastened upon the Graeco-Roman mind in the days of its full vigour. We may remember the energy with which the Roman Government combated the first outbreak of the Bacchic plague.'

The passage reappears in the third edition of *The Golden Bough*, Part IV: 'Adonis, Attis, Osiris', vol. i, pp. 300-1 (London 1914, Macmillan, preface dated January 1914). The view expressed in it is cited, and accepted without question as a satisfactory state-

It was indeed still ebbing when the present lines were being written on the 4th March, 1948, and, in the act, the present writer was wondering what that gentle scholar would have had to say, if he had been revising *The Golden Bough* for a fourth edition, about some of the ways in which Europe's return 'to native ideals of life and conduct' had manifested itself during the forty-one years that had now passed since the first publication of this provocative passage in A.D. 1907.¹ In the light of the portentous events of this latter-day chapter of Western history, Frazer and his like-minded contemporaries had proved to be the last generation of Western neo-pagans of a rational, unenthusiastic, tolerant school that had first emerged in the Italy of the *Quattrocento* and that had captivated the Transalpine Western World in and after the closing years of the seventeenth century of the Christian Era. By A.D. 1952 they had been swept off the field by demonic, emotional, violent-handed successors who had suddenly emerged, unheralded, out of the unplumbed depths of a secularized Western Society. The words of Frazer had been re-uttered by the voice of Alfred Rosenberg with a different ring. Yet this startling change in the application of a Western neo-pagan doctrine must not blind us to the truth that Rosenberg and Frazer were both propounding an identical Gibbonian thesis.

In dealing with this thesis in an earlier part of this Study,² we have been content to argue that Gibbon was mistaken in his view of the date at which the Hellenic Civilization reached and passed its zenith, and that in truth it had inflicted mortal wounds on itself long before the appearance, above its horizon, of Christianity or any of the other higher religions with which Christianity eventually competed for the conquest of a moribund Hellenic World. It is, indeed, indisputable that the Hellenic achievement of parochial self-government and the Hellenic virtue of parochial patriotism had by that time been discredited and extinguished through being misdirected and misused by their own authors and exponents. When, in the fifth century B.C., the supreme social need of the Hellenic World had come to be the achievement of political unity,³ the characteristic features of Hellenic public life had become the bane, instead of the glory, of the Hellenic Civilization; and, though, even after these parochial patriotisms had brought the Hellenic Society to its breakdown in the outbreak of the Atheno-Peloponnesian War, the Hellenic peoples had continued, for four more terrible centuries, to sacrifice the pursuit of true prosperity and true happiness on the altars of traditional political idols, they had been weaned from this idolatry at last when it had demanded of them the immolation, not merely of 'the good life', but of life itself.

Augustus could never have established his oecumenical peace if the public feeling of the Hellenic Society of his day had not been over-

ment of the truth, in a note on 'the Importance of Palestine in the World of Religion' which appears in the official report on the Census of Palestine in 1931 (Mills, E.: *Census of Palestine, 1931* (Alexandria 1933, Whitehead Morris, 2 vols.), vol. i, p. 79).

¹ This passage is not to be found in the sections on Adonis, Attis, Osiris in the first edition of *The Golden Bough*, vol. 1 (London 1890, Macmillan), chap. iii, sections 4, 5, and 6, pp. 278-320.

² In IV. iv. 58-63.

³ See IV. iv. 61-3 and 206-14.

whelmingly in favour of his policy.¹ By Augustus's time there was nobody left in the Hellenic World except the Roman senatorial aristocracy who would still have preferred retaining self-government to getting rid of social disorders, and nobody at all who would still have preferred retaining parochial sovereignty to getting rid of wars. The sufferings that the Hellenic Society had inflicted on itself had produced this revolutionary change in its outlook without the intervention of any external agency. In a post-mortem inquiry into the causes of the death of Hellenism, this reading of Hellenic history, if correct, acquits Christianity and the other higher religions that, in the next chapter of the story, were Christianity's competitors for the spiritual conquest of Hellenic souls. These 'Oriental faiths' were filling a spiritual vacuum, not creating one; and the same verdict emerges from an examination of the role of the Mahāyāna—an 'Occidental faith'² from the Sinic World's geographical standpoint—in the closing chapters of the history of a disintegrating Sinic Civilization.³

The issue, however, is too important to allow us, at this stage of our inquiry, to dismiss it when we have recapitulated our argument that the Frazerian view is in fact confuted by the principal relevant passages of history up to date. This *argumentum ex Clui silentio* is not enough. Higher religions might not have caused the deaths of civilizations in the past, yet this tragedy might still be a possibility. To get to the bottom of the issue, we must carry our inquiry from the macrocosm into the microcosm, from the facts of past history to the abiding characteristics of Human Nature.

Even if Frazer may be wrong in his interpretation of the past historical facts with which he seeks to put his thesis to the proof, we have to ask ourselves whether he may be right, nevertheless, in his contention that the higher religions are essentially and incurably anti-social. When there is a shift in the focus of human interest and energy from the ideals aimed at in the civilizations to those aimed at in the higher religions, is it true that social values, for which the civilizations claim to stand, are bound to suffer? Are spiritual and social values antithetical and inimical to one another? Is the fabric of civilization undermined if the salvation of the individual soul is taken as being the supreme aim of life? Frazer answers these questions in the affirmative; and, if his answer were right, it would mean that human life was a tragedy without a catharsis. The writer of this Study believed that Frazer's answer was not right; for, in his belief, it was based on a fundamental misunderstanding of the nature of the higher religions and the nature of souls or personalities.

In earlier passages of this Study it has been contended that Man is neither a selfless ant nor an Ishmaelish Cyclops,⁴ but a social animal⁵ in whose nature there is not a Frazerian 'pre-established disharmony'

¹ For the gratitude that Augustus's work evoked in the hearts of his contemporaries see V. v. 648 and 649, n. 1; V. vi. 181, n. 3; and p. 41, with n. 2, above.

² When once we have parted company with sanity by reading emotional connotations of comparative moral and cultural values into the points of the compass, 'Occidental' will serve just as well as 'Oriental' for a term of abuse.

⁴ See III. iii. 217-22.

between the individual and Society. It would be nearer the truth to say that this supposed antithesis is illusory; for the individual can only express and develop his personality through relations with other personalities, while, conversely, Society is nothing but the common ground between one individual's network of relations and another's, and it has no existence except in the activities of individuals who, for their part, cannot exist except in Society. Nor, again, is there any 'pre-established disharmony' between the individual's relations with his fellow men and his relation with God. In the spiritual vision of Primitive Man there is manifestly a solidarity between the tribesman and his gods¹ which, so far from alienating the human members of a primitive society from one another, is perhaps the strongest of all social bonds between them. The workings of this harmony between Man's duty to God and his duty to his neighbour have been explored and illustrated at the primitive level by Frazer himself, and disintegrating civilizations had borne witness to it when they had sought a new bond for Society in the worship of a deified Caesar. Is the harmony converted into a discord by 'the higher religions,' as Frazer contends? In theory and in practice alike, the answer would appear to be in the negative.

On an *à priori* view (to start from that approach) personalities are not conceivable except as agents of spiritual activity; and the only conceivable scope for spiritual activity lies in relations between spirit and spirit. In seeking God, Man is performing a social act; and, if God's Love has gone into action in This World in the redemption of Mankind by Christ, then Man's efforts to make himself less unlike a God who has created Man in His own image² must include efforts to follow Christ's example in sacrificing himself for the redemption of his fellow men. Seeking and following God in this way that, in a Christian's belief, is God's way, is, in a Christian's eyes, the only true way for a human soul on Earth to seek salvation. The antithesis between trying to save one's own soul by seeking and following God and trying to do one's duty to one's neighbour is therefore false.

'Thou shalt love the Lord thy God with all thy heart and with all thy soul and with all thy mind. This is the first and great commandment. And the second is like unto it: Thou shalt love thy neighbour as thyself. On these two commandments hang all the Law and the Prophets.'³

The two activities are indissoluble because 'he that loveth not his brother whom he hath seen, how can he love God whom he hath not seen?'⁴ The Christian soul that is truly seeking to save itself by loving God in God's way is as fully social a being as the bee-like Spartan who saves his personal honour by dying for his hive at Thermopylae; only the Christian soul on Earth is enrolled in a different society from the Spartan hive or the Roman Leviathan. He is a citizen, not of a secular commonwealth, but of the Kingdom of God, and therefore his paramount and all-embracing aim is, not to identify himself with the genius of an earthly city, but to attain the highest degree of communion with,

¹ See V. vi. 13.

³ Matt. xxii. 37-40.

² Gen. i. 26 and 27; v. 1; ix. 6.

⁴ 1 John iv. 20.

and likeness to, God Himself; his relations with his fellow men are consequences of, and corollaries to, his relations with God; his standard for his attitude towards his fellows will be his intuition of God's attitude towards Man; and his way of loving his neighbour as God loves Man will be to try to help his neighbour to win what the Christian is seeking for himself—that is, to come into closer communion with God and to become more godlike.

If this is a soul's recognized aim for itself and for its fellow souls in the Christian Church Militant on Earth, then it is evident that under a Christian dispensation God's will *will* be done on Earth as it is in Heaven to an immeasurably greater degree than in a secular mundane society. It is also evident that, in the Church Militant on Earth, the good social aims of the mundane societies will incidentally be achieved very much more successfully than they ever have been or can be achieved in a mundane society which aims at these objects direct, and at nothing higher. In other words, the spiritual progress of individual souls in this life will in fact bring with it much more social progress than could be attained in any other way. It is a paradoxical but profoundly true and important principle of life that the most likely way to reach a goal is to be aiming not at that goal itself but at some more ambitious goal beyond it. This is the meaning of the fable in the Old Testament of Solomon's Choice¹ and of the saying in the New Testament about losing one's life and finding it.²

Ah, but a man's reach should exceed his grasp,
Or what's a heaven for?³

This exposition of the harmony between the conception of Man's duty to God and the conception of his duty to his neighbour has been made in terms of Christianity, but it could be translated into terms of Mithraism or of the worships of Cybele and Isis, which competed with Christianity for the captivation of the Hellenic World, or into terms of the Mahāyāna, which did captivate the Sinic World as Christianity captivated the Hellenic. The essence of Christianity is the essence of the higher religions as a class, though in different eyes these different windows through which God's light shines into Man's soul may differ in the degree of their translucency or in the selection of the rays that they transmit. When we pass from theory to practice, we shall learn most from the histories of Christianity and the Mahāyāna, which went on living and working after their competitors had fallen by the way.

The harmony which Frazer denies is exemplified in practice in the lives of the Christian anchorites—a Saint Antony in his desert in Egypt or a Saint Symeon on his pillar in Syria—in an age when the Roman Empire, and the Hellenic Society embodied in it, were approaching their final dissolution. It is manifest that, in insulating themselves physically from their fellow men, these saints were entering into a far more active relation with a far wider circle than any that would have centred round them if they had remained 'in the World' and had spent their lives in

¹ 1 Kings iii. 5–15.

some secular occupation. They swayed the world from their retreats to greater effect than the Emperor in the city or than the master of the soldiers in the cantonment, because their personal pursuit of holiness through seeking communion with God was a form of social action that moved their fellow men more powerfully than any secular social service on the military or the political plane. The anchorites were recognized by their contemporaries to be pursuing the highest social aim on behalf of all Mankind with complete single-mindedness and disinterestedness; and this spectacle of their self-realization through self-surrender struck their contemporaries' imaginations and touched their hearts and thereby played its part in the forging of a social bond of a spiritual order which held firm when Society dissolved on the political and economic levels.

'It has sometimes been said that the ascetic ideal of the East Roman was a barren withdrawal from the world of his day; the biography of John the Almsgiver¹ may suggest why it was that the Byzantine in his hour of need turned instinctively for aid and comfort to the ascete in the full assurance of his sympathy and succour. . . . One of the outstanding features of early Byzantine asceticism is its passion for social justice and its championship of the poor and oppressed.'²

The anchorites' concern and travail for the welfare of their fellow men would still have been recognized without question by their contemporaries if the anchorites themselves had never departed from their chosen and approved way of performing the *opus Dei*. But there were occasions on which the anchorites showed their love for Man and their humility towards God by breaking the régime of insulation that they had imposed on themselves and returning to the World to intervene in a secular crisis.

Thus³ in A.D. 475-6 Saint Daniel the Stylite, at the instance of the emissaries of the Orthodox Patriarch of Constantinople, consented to descend from his pillar at Anaplis, up the Bosphorus, in order to save Orthodoxy from the Monophysite proclivities of the usurping Emperor Basiliscus.⁴ The mere news of the holy man's epiphany in the cathedral church of the Apostles in the Imperial City frightened the Emperor into evacuating his own capital and retreating to the imperial palace at the seventh milestone. It was indeed a crushing indictment of his conduct of public affairs that the report of his people's affliction should have moved the saint to re-emerge from a physical isolation in which, by

¹ John the Almsgiver was Orthodox Patriarch of Alexandria from A.D. 611 to A.D. 619. During these years Syria was under Persian military occupation while Egypt was still in Roman hands, and the Patriarch had to cope with an influx of Syrian refugees.

² Dawes, E., and Baynes, N. H.: *Three Byzantine Saints* (Oxford 1948, Blackwell), pp. 198 and 197.

³ An English translation of the original Greek text narrating the following story will be found in Dawes and Baynes, op. cit., pp. 49-59. The anonymous author was one of the Saint's personal attendants.

⁴ Monophysitism versus Orthodoxy was a secular as well as a religious issue at this date, since Monophysitism was becoming the theological expression of the resurgent national consciousness of the non-Hellenic peoples of the eastern provinces of the Roman Empire—particularly the Copts, Syrians, and Armenians—as against the Orthodoxy of the 'Melchite' Greek-speaking supporters of the Roman Imperial régime (see I. i. 91 and 155; II. ii. 76, 286-7, and 374; IV. iv. 325-6 and 593, n. 3; and V. v. 127).

that time, he had been living already for twenty-four years¹ and which was to have lasted unbroken till his death. Working spiritual acts of psychical and physical healing on his way, Saint Daniel led the clergy and people of Constantinople to beard the truant prince in his suburban asylum; and, when the guards refused the crowd admission to the imperial presence, the saint directed the people to follow him in the scriptural symbolic act of shaking the dust of the palace precincts off their garments—which they did with such a thunderous reverberation that most of the guards on duty were moved to desert their imperial master and follow in the stylite's train. In vain the Emperor sent messages after the departing saint to beg him to return to the Hebdomon; in vain he returned to Constantinople himself and besought Daniel to visit him in his palace there. In the end the Emperor was constrained to present himself before the Saint in the Cathedral and prostrate himself at his feet; and a public profession of Orthodoxy was the price that he eventually had to pay in order to save his throne by setting Daniel at liberty to resume his station on his pillar-top.

This was the sole occasion on which Saint Daniel issued from his physical seclusion during a period of forty-two years (A.D. 451-93) which saw the Roman Empire founder in the West while in the East it escaped shipwreck under the spiritual pilotage of the stylite's 'distant control'.

'For three and thirty years (A.D. 460-93) he stood for varying periods on the three columns. . . . During these he was deemed worthy to receive "the prize of his high calling";² he blessed all men, he prayed on behalf of all, he counselled all not to be covetous, he instructed all in the things necessary to salvation, he showed hospitality to all, yet he possessed nothing on Earth beyond the confines of the spot on which the enclosure and religious houses had been built.'³

On the face of it, Saint Daniel's return to the World in order to rescue his fellow men from political oppression is the same story as the return of Purun Baghat⁴ to give warning, to the village below this Hindu hermit's cave, of an impending landslide that would otherwise have engulfed the villagers unawares. The point is, indeed, the same in the legend of the Christian saint and in the Western storyteller's version of a Hindu theme. The historic Christian and the imaginary Hindu hermit each rises to his highest spiritual flight by breaking away, for the love of God and Man, from a settled course of physical withdrawal from the World along which he had been seeking spiritual perfection. Yet, though both responded in the same way to the same illumination, there is a difference between their spiritual histories in the crucial point of the relation of the new light that had dawned on them to their previous spiritual outlook. The Christian saint had been led into his physical retreat from the World by the same love of God and Man that eventually moved him to descend from his pillar, whereas the Hindu sage, when

¹ For the first nine years of these twenty-four, Saint Daniel had immured himself in an ex-pagan temple; for the last fifteen he had marooned himself on the top of a pillar.

⁴ Kipling, Rudyard: 'The Miracle of Purun Baghat' in *The Second Jungle Book* (cited in III. iii. 190-1).

he yielded to the impulse of love and pity that sent his feet hastening down the mountainside from the cave to the village, was not fulfilling his philosophy but was flying in its face—and who can say whether he would have brought himself to make this sacrifice 'in real life', if he had been an historical character authentically brought up in a philosophical tradition inherited by Hinduism from a Primitive Buddhist School, instead of having been created, as he was, by the imagination of a Western man of letters brought up in the religious tradition of Christianity?

The truth is that Frazer's strictures, which miss their mark when he directs them against the saints, find a legitimate target in the philosophers, be they of the Indic or of the Hellenic school, who cultivate a detachment in which the withdrawal leads to no return.¹ The Hinayanian, Stoic, and Epicurean ideal of the sage goes astray through casting Man for a superhuman role of godlike self-sufficiency and thereby condemning the adept to seek a way out of an impossible position by restricting himself to a sub-human performance. This philosophy attempts to make of Man, not a saint inspired by God's grace, but a very god in himself; and, since this is too heavy a burden for a human soul to bear, the philosopher cannot make even a pretence of carrying it off unless he lightens his self-imposed load by casting out his God-given feelings of love and pity for the rest of God's creatures.²

It is true that, when we diagnose the causes of the breakdown of the Hellenic and the Indic Civilization, the philosophers, too, must be acquitted. It can be demonstrated that, though they made their appearance earlier than the saints, they too did not appear till after the civilization had dealt itself a mortal wound, and that they too did not make a spiritual vacuum but sought, like the missionaries of the higher religions after them, to fill one that had already been made by a parochial patriotism which had begun by claiming the citizen's entire allegiance and had ended by discrediting the civic virtues through the evil which it had led men to do in their name. If, however, we were to put Philosophy on trial, not for historic sins against Society imputable to her account, but for latent anti-social potentialities in her doctrines, ideals, and *éthos*, we should find her more vulnerable than Religion to Frazer's indictment.³ Philosophy's most insidious offence is to refashion Man's ideal of God in the human sage's image. In place of a homicidal God-the-tribesman she has nothing better than a stony-hearted God-the-isolationist⁴ to offer to souls that have wearied at last of the never-ending holocausts exacted by a hydra-headed idol.

No doubt we should also find that many would-be saints—like the pilgrim in Tolstoy's tale who persisted in his journey to Jerusalem without letting the love of God side-track him, like his companion, into helping a neighbour in need⁵—had sinned against their own ideal by falling into the unsocial practice of the philosophers. To detach oneself spiritually from the World is an easier option than the travail of sharing

⁴ This idea of God is illustrated in the passages of Hellenic and Indic literature that have been quoted in V. vi. 144-6.

⁵ See Tolstoy, Leo: *Two Old Men*.

God's love for the World and participating in His work of transfiguring it; and in the Hellenic World the higher religions found Philosophy already in the field, with an established tradition and prestige, on the wait to captivate souls in whom the flame of divine love was burning low. Many, perhaps a majority, of the aspirants to sainthood fell by the way-side; yet the few who did live up to the Christian ideal in some measure sufficed to secure the survival of a Christian society when Roman hands failed to save an Hellenic Civilization from the final consequences of its own past suicidal acts. It looks as if the spirit of the higher religions, so far from being a social cancer, were the bread of social, as well as spiritual, life.

(II) CHURCHES AS CHRYSALISES

(a) THE GROUNDS FOR THE CHRYSALIS CONCEPT

In the preceding chapter we have joined issue with Celsus and Rutilius and with the exponents of their thesis in our Western World in its modern age. We have contested the view that churches are cancers which eat the living tissues of a civilization away; yet we may still agree with Frazer's dictum, at the close of the passage which we have taken as our text,¹ that the tide of Christianity, which had flowed so strongly in the last phase of Hellenic history, had been ebbing in these latter days, and that the post-Christian Western Society that had emerged was one of the same order as the pre-Christian Hellenic Civilization. This observation opens up a second possible conception of the relation between universal churches and civilizations. On this view the churches present themselves, not as the sinister destroyers of civilizations, but as their useful humble servants. This role is assigned to the Catholic Christian Church—in contrast to the spirit of a gnostic form of Christianity that had gravitated towards the standpoint of the philosophies of Detachment—in a passage from the pen of a Modern Western scholar which has been quoted at a previous point in this Study² without its significant concluding sentence.

'The old civilisation was doomed, but this religious Nihilism puts nothing in its place. To the orthodox Christian, on the other hand, the Church stood, like Aaron, between the dead and the living, as a middle term between the things of the Next World and of This. It was the Body of Christ and therefore eternal; something worth living for and working for. Yet it was in the World as much as the Empire itself. The idea of the Church thus formed an invaluable fixed point, round which a new civilisation could slowly crystallise.'³

On this view, universal churches have their *raison d'être* in keeping the species of society known as civilizations alive by preserving a precious germ of life through the perilous interregnum between the dissolution of one mortal representative of the species and the genesis of another. In this repetitive process of the reproduction of civilizations, which is assumed to have an absolute value as an end in itself, the

¹ See p. 384, above.

² In V. vi. 157.

³ Burkitt, F. C.: *Early Eastern Christianity* (London 1904, Murray), pp. 210-11.

churches are useful and perhaps necessary, but secondary and transitional, phenomena. A church serves as egg, grub, and chrysalis between butterfly and butterfly. The writer of this Study had to confess that he, too, had been satisfied for many years with this rather patronizing view of the churches' role and nature;¹ and he still believed that this conception of churches as chrysalises, unlike the conception of them as cancers, was true as far as it went; but he had come to believe that this was so small and unrepresentative a facet of the whole truth about universal churches as to be utterly misleading if it was mistaken for the whole of which it was in reality a minor part. It may be convenient at this point to explore, by an empirical survey, how far this partial truth—if such indeed it is—will carry us, and then to take the limit reached in this inquiry as a starting-point for seeking a standpoint that will yield a more enlightening perspective.

If we cast our eye over the civilizations that were still alive in A.D. 1952, we shall see that every one of them had in its background some universal church through which it was affiliated to a civilization of an older generation. The Western and Orthodox Christian civilizations and the offshoot of Orthodox Christendom in Russia were affiliated through the Christian Church to the Hellenic Civilization; the Far Eastern Civilization and its offshoot in Korea and Japan were affiliated through the Mahāyāna to the Sinic Civilization; the Hindu Civilization was affiliated through Hinduism to the Indic; the Iranic and the Arabic through Islam to the Syriac. All the eight then extant civilizations had churches for their chrysalises, and the seven then extant fossils of extinct civilizations were all preserved in ecclesiastical integuments. This was true alike of Jewry, a fossil of an extinct Syriac Civilization that had come to be dispersed throughout the World; of the Parsee, Nestorian, and Monophysite fossils of the same extinct Syriac Civilization in South-Western Asia and India; of the Jain fossil of the Indic Civilization in India; of the Hinayanian Buddhist fossils of the Indic Civilization in Ceylon, Burma, Siam, and Cambodia; and of the same civilization's Tantric Mahayanian Buddhist fossils in Tibet, Mongolia, and the Soviet Union.² Even the Buddhist fossils, which were not scattered in diaspora but possessed national homes of their own in physical fastnesses or in 'geopolitical' *intermundia*, might have been ground to powder, long since, by the mighty living civilizations around them, but for the consolidation of their texture by the 'social cement' of a highly and peculiarly institutionalized religion.

¹ In a spiritually sensitive soul, the same interpretation of the historical facts may, of course, breed a mood of melancholia instead of complacency:

'As Classical Civilisation collapsed, Christianity ceased to be the noble faith of Jesus the Christ: it became a religion useful as the social cement of a world in dissolution. As such, it assisted at the rebirth of Western European Civilisation after the Dark Ages. It has endured to be the nominal creed of clever and restless peoples who are ceasing to give even lip-service to its ideals. As to its future, who can prophesy?' (Barnes, E. W.: *The Rise of Christianity* (London 1947, Longmans Green), p. 336).

² In A.D. 1952 the Buriat community still survived in Transbaikalia, though the Calmuck community that had tenanted the pasturelands between the lower reaches of the Volga and the Don since the seventeenth century of the Christian Era (see III. iii. 397) was reported to have been liquidated as a punishment for disloyalty to the Soviet Union at the time of the German invasion during the General War of A.D. 1939-45.

In these fossil communities the chrysalis church had preserved an elsewhere extinct civilization in a state of suspended animation, without having succeeded in inducing a new civilization to germinate within its protective but restrictive sheath. To investigate the process by which a new civilization does affiliate itself to a predecessor through the agency of a church, we must concentrate our attention on the living civilizations. On a synoptic view of the antecedents of these, we shall find ourselves able to analyse the process of transition to them from their predecessors into three phases which, from the standpoint of the chrysalis church, we may label 'conceptive', 'gestative', and 'parturient'.

The conceptive phase of the missionary role of a universal church sets in when the church seizes an opportunity that is offered to it by the secular social environment in which it arises.

This environment is the universal state which a disintegrating civilization throws up, at an advanced stage of its decline, in an effort to arrest the fatal process. By the time when this rally is achieved, and not least in the very act of achieving it, the ailing secular society, partly unintentionally and partly deliberately, has put out of action many of the master institutions of its phase of growth—above all, the parochial states which, while the society was still in health, gave such scope for variety in the exercise of its creative powers, and this not only in the political and economic fields, but in the visual arts, literature, and other provinces of culture. The universal state could not arise until its parochial predecessors had decimated their own ranks by recurrent fratricidal wars, and until the weakened survivors had exhausted their credit of affection and loyalty in the hearts of citizens on whom they had been calling for never-ceasing and ever-increasing sacrifices; and, after establishing itself, it could not secure its position against the threat of a recrudescence of international anarchy without curbing the remnant of parochial sovereignty and sapping the remnant of self-government. In this situation the sorely tried populations that have been united politically at last within the universal state's frontiers find themselves torn between conflicting feelings which they cannot reconcile. Their dominant emotions are a thirst for peace and quiet and a grateful acquiescence in the oecumenical régime that has brought them these long-desired blessings, and this general attitude of mind is the psychological foundation of the parvenu imperial government's rule. But the sense of relief is traversed and tempered by a sense of frustration; for Life cannot preserve itself by bringing itself to a halt; the stream of psychic energy known in the language of a Modern Western school of Psychology as *libido* continues to well up out of its springs in the subconscious depths; and, as the universal state settles down and its subjects begin to recuperate from their exhaustion, while the memory of the preceding Time of Troubles begins to fade, they suffer more and more discomfort from the choking up of the ancient institutional outlets for the flow of the human 'social animal's' life-force.¹

¹ The discomfort is apt to be at its maximum in the universal state's capital city, 'quo cuncta undique atrocia aut pudenda confluunt celebranturque' (Tacitus: *Annals*, Book XV, chap. 44).

This is a psychological need for which the universal state itself does not provide; for its *raison d'être* is the negative one of re-establishing control over destructive forces that have got out of hand; and, so far from being concerned to open up innocuous alternative channels for activity, it tends to look askance at all new manifestations of Life as so many more openings for fresh outbreaks of the demonic spirit of Anarchy. In this situation a nascent universal church may make its own fortune by doing for a stagnant secular society the service that is now its most urgent need; for it can open up new channels for the baulked spiritual energies of Mankind without asking the imperial government's leave and sometimes, still more effectively, in defiance of its veto. In the Roman Empire,

'The victory of Christianity over Paganism . . . furnished the orator with new topics of declamation and the logician with new points of controversy. Above all, it produced a new principle, of which the operation was constantly felt in every part of Society. It stirred the stagnant mass from the inmost depths. It excited all the passions of a stormy democracy in the quiet and listless population of an overgrown empire. The fear of heresy did what the sense of oppression could not do; it changed men, accustomed to be turned over like sheep from tyrant to tyrant, into devoted partisans and obstinate rebels. The tones of an eloquence which had been silent for ages resounded from the pulpit of Gregory. A spirit which had been extinguished on the plains of Philippi revived in Athanasius and Ambrose.'¹

This passage from the pen of a Modern Western historian is as truthful as it is eloquent, but its theme is the second chapter in the story. At this stage the opening of new channels by the Christian Church did indeed release intellectual and political energies that had been dammed back so long that their currents had been flowing in reverse into the Dead Sea of Archaism.² But this chapter followed a previous, and more critical, stage in the encounter between universal church and universal state in which a head-on collision between them had given ordinary men and women a fresh opportunity for making a supreme sacrifice that had been the glory and the tragedy of Society in the age of parochial sovereignty and fratricidal warfare.

The essence of the institution of the parochial state is the custom that calls on its citizens to give their lives for it in war, and this demand is psychologically possible so long as their country fills the whole of their mental horizon and appears to embrace the sum of things human and divine. This pretension of a state to be the Universe, preposterous though it be, only ceases to command assent and obedience when the last of the contending parochial states of a disintegrating society have been annihilated and replaced by a single universal state which, at the beginning, commands the loyalty of no more than that fraction of its population that constitutes the imperial people, and when concurrently the people's religious devotion is transferred from cults with local roots to higher

¹ Macaulay, Lord: 'History', in *Miscellaneous Writings* (London 1860, Longmans Green, 2 vols), vol. i, p. 267. Compare the passage, describing how Religion filled a psychological vacuum in the Achaemenian Empire, that has been quoted from Eduard Meyer in V. vi. 29-33.

² See V. vi. 49-97.

religions with a message for all Humanity.¹ Under the pagan Roman Empire in the Age of the Principate, no one, as we have seen,² except a handful of professional soldiers, recruited by voluntary enlistment, was called upon to die for an oecumenical polity, but the Roman Government itself was unable to prevent civilians of the most 'unmartial' social antecedents from sacrificing their lives as martyrs to the cause of the Christian Church. This state of affairs—so rare up to date in the Age of the Civilizations—in which the object for which men and women were prepared to give their lives was a church and not a state,³ might foreshadow the future relation between Politics and Religion in a coming age that had not yet emerged above the historical horizon of the writer's generation.

Thus, in this 'conceptive' phase of the encounter between a universal church and a universal state, the church receives into itself the energies that the state can neither utilize nor liberate, and creates new channels along which these can find vent. The 'gestative' phase that follows is distinguished by a vast increase in the church's range of creative action. The outlets already found by the church for energies with which the

¹ See Eduard Meyer, loc. cit.

² On pp. 342-4, above.

³ The foregoing account of the conceptive phase of the missionary role of a church has drawn the following comment from Mr. Martin Wight:

'An interesting point emerges here, which the reader would like you to develop. You illustrate the conceptive phase only from Christian history. Does this mean that there is not comparable evidence from the other higher religions?

'Is it correct to say that the characteristic mark of the conceptive phase is *sanguis martyrum semen ecclesiae*? If so, then there are *a priori* reasons for expecting the conceptive phase to have a peculiar importance in the history of Christianity, if not actually to be peculiar to Christianity. 1. Christianity is the only higher religion whose Founder consummated his mission by being himself martyred. Is it also the only one whose Founder emphasised martyrdom as the likely fate and the supreme test of fidelity for his followers?—Anyway, to share the sufferings of Christ has always had a central place in the tradition of Christian devotion (cp. Matt. x. 17-22 and 39, Mark x. 39, John xvi. 2, Rom. viii. 17, Rev. vi. 9-11), and the will-to-martyrdom was probably greater among Early Christians than among the early adherents of other higher religions. 2. Christianity has always made more exclusive claims than the other higher religions (except Islam), and consequently made it peculiarly difficult for the universal state in which it arose to be tolerant towards it (cp. V. vi. 46-47).

'In other places in this Part you refer to what might be evidence for or against an occurrence of the conceptive phase in the other churches. Islam did not grow up within a universal state but conquered one from outside, so that its seed was not the blood of the martyr but the sword of the warrior: the conceptive phase, if any, must therefore have taken a different form (see p. 411, n. 4, below), and the subsequent retroactive persecution by the new church of the residual pre-higher-religion minority was less severe than in the case of Christianity (cp. p. 400, below). The two Indic religions have been inherently tolerant (see pp. 438-9, below). Does this mean that Hinduism established itself without any need of *sanguis martyrum*? As for the Mahāyāna, it permeated the Far Eastern Society with only "occasional bouts of repression" (see p. 405; cp. pp. 541-2). "These persecutions", says C. P. Fitzgerald, "never resembled those so familiar from Western religious history. There were no burnings, no torture or massacre of the faithful. At most the authorities ordered the destruction of some or all of the monasteries, and forced nuns and monks to return to family life, sometimes by the expedient, repugnant to all good Buddhists, of mating the monks and nuns themselves" (*China, A Short Cultural History*, p. 276). Is this a valid generalisation?

'The question is twofold: 1. Has *sanguis martyrum semen ecclesiae* been true on the whole only of Christianity? For if so, it seems to give the conceptive phase a deeper significance for the Christian Church than for the others. 2. If so, what have been the marks of the conceptive phase for the others?

In the opinion of the writer of this Study the answer to the first of these two questions is in the affirmative, while the answer to the second is that, in the histories of the other higher religions, as in the history of Christianity, the essential mark of the conceptive phase is to be found in a transfer of spiritual energy from secular to religious channels.

universal state has been unable to cope are equivalents, as we have seen, of secular institutions and activities which had been creative in a civilization's growth phase but destructive in its Time of Troubles and incompatible with the rest-cure of an oecumenical polity. In the next chapter of the story the secular oecumenical institutions which the universal state has built up go the same way as the secular parochial institutions that they have supplanted. After having come into existence to meet a social need, they become a social incubus by clinging to existence after they have ceased to fulfil their purpose; and at this point the church intervenes again. She uses the achievements and experience of the now declining universal state for building new oecumenical institutions of her own, and draws into her service for this purpose men of mark who have failed to find scope for their genius as public servants of the secular imperial power in its tragi-comic last phase of paralysis and ineptitude.

We have studied this process of spoiling the Egyptians already in our survey of the beneficiaries from imperial installations, currencies, and corporations,¹ and we need not recapitulate our findings. We may pass on now to observe that the new shapes into which the church recasts the borrowed secular institutions prove capable of surviving a social interregnum in which the declining universal state goes to pieces, carrying with it the moribund secular civilization of which it is a political embodiment. What is more, this ability of the church to ride the storm is apprehended intuitively by the mass of Mankind, who by this time have a presentiment of the secular society's doom and are anxiously looking for a raft on which they may take refuge from the sinking ship. The transition to the 'gestative' from the 'conceptive' phase of the church's service as a chrysalis is signalized by a spate of mass-conversions.

The speed and scale of such religious landslides appear, as might be expected, to be proportionate to the degree of the pressure exerted on the disintegrating civilization by the barbarian aggressors who are the church's competitors for this derelict heritage.

In another context² we have already observed that in a moribund Sinic World the Mahāyāna began to make appreciable progress after the collapse of the Han Empire towards the close of the second century of the Christian Era and its replacement in the third century by the indigenous successor-states known as 'the Three Kingdoms'. When, however, in the fourth century of the Christian Era the North was overrun and occupied by Eurasian Nomad war-bands, while the regions south of the watershed between the Yellow River and the Yangtse Basin succeeded in keeping these alien invaders at bay, there was a sudden sharp differentiation in the fortunes of the Mahāyāna in these two now politically differentiated areas. In the North the Mahāyāna now captivated an overwhelming majority of the population—no less than 90 per cent., even according to the testimony of unsympathetic historians of the Confucian School. In the South, where the sense of insecurity was less acute, the new higher religion never succeeded in either absorbing or erasing the old secular culture. Though the strength

¹ On pp. 80-379, above.

² On pp. 370-2, above.

of the hold which the Mahāyāna obtained there too is attested by the devotion to it of so cultivated a ruler as Liang Wuti (*imperabat* A.D. 502-49), the tradition of Confucian scholarship and administration succeeded in maintaining in the South a base of operations from which it eventually reasserted itself throughout the domain of a nascent Far Eastern Society.

In a moribund Hellenic World the sudden mass-conversion of the northern provinces of the Han Empire to the Mahāyāna in the fourth century of the Christian Era had its counterpart in the similar conversion of the western provinces of the Roman Empire to Catholic Christianity in the fifth century, when these provinces were being overrun by Nomadic or Nomadicized barbarians from the Eurasian Steppe and by sedentary barbarians from the North European forests. The religious landslide that was precipitated here at this date by a similar political and social crisis was the more remarkable considering that the Christian Church had won the bulk of its converts in the eastern and central provinces of the Empire during the first three centuries of its history; and, though Constantine's manifesto in favour of Christianity on the eve of the Battle of the Milvian Bridge indicates that, by A.D. 312, Christianity was already a force to be reckoned with in the western regiments of the Imperial Army,¹ it seems not to have become anything more than a minoritarian religion among the civil population in the West till the close of the fourth century. In these backward western provinces at this time the peasantry and gentry were falling more and more under the influence of the great landowners of the Senatorial Order, and these western provincial *virī senatorii* were influenced in their turn by the metropolitan senatorial nobility in Rome, who were 'die-hard' devotees of Paganism.² Among the Gallic Roman grandees and their retainers the revolutionary change of religious outlook within the century that embraces the lifetimes of Rutilius Namatianus and Sidonius Apollinaris is no doubt to be explained by the deeply disquieting effect of the successive waves of barbarian invasion that swept across Gaul between the breach of the Rhine frontier by the Vandals and their comrades in A.D. 406 and the overthrow of the no longer unmitigatedly barbarous Visigoths by the still portentously unreclaimed Franks in A.D. 507.

In a moribund Syriac World in the time of the Caliphate the barbarian pressure that evoked the sharpest anxiety and apprehension was the onset of the Eurasian Nomad Turks, and the exposed area consisted of the provinces of the Caliphate, from Khurāsān to Fāghānah inclusive, that lay to the north-east of the central desert of Iran and of the narrow passage at the Caspian Gates between the north-western edge of the desert and the belt of mountains, forest, jungle, and swamp that extended, on the other side of the fairway, to the shores of the Caspian Sea. In the light of the episodes of Hellenic and Sinic history which we have noticed above, it is not surprising to catch glimpses of mass-

¹ See p. 341, above. N. H. Baynes, in his *Constantine the Great and the Christian Church* (London 1929, Milford), p. 4, estimates that Christianity was professed by perhaps one-tenth of Constantine's subjects at this date.

² See V. vi. 88-89.

conversions to the orthodox Sunnī form of Islam in these outpost provinces of the Caliphate from the turn of the eighth and ninth centuries of the Christian Era onwards.

Already in the Umayyad Age, when Khurāsān was still the north-east frontier province of the Caliphate, before the definitive conquest of Transoxania, the local Iranian population had been quick to fraternize with its Arab conquerors in the common interest of fending off the barbarians; and the Iranian clients whom the Arab frontier garrisons enlisted in their ranks seem to have become converts to Islam as a matter of course.¹ After the definitive incorporation of Transoxania in the Caliphate and the subsequent turn of the tide of war in the barbarians' favour under the 'Abbasid régime, the process gathered momentum. The conversion of Sāmān, a member of the local Iranian nobility at Bākh, from Zoroastrianism to Islam, towards the end of the eighth century of the Christian Era,² was the first step towards the establishment of a Samanid successor-state of the 'Abbasids that took over from its nominal suzerains a wardenship of the north-eastern marches which the 'Abbasids themselves had become too feeble to administer effectively any longer from their distant headquarters at Baghdad.³

The example set by Sāmān's conversion to Islam was widely followed by his descendants' subjects,⁴ and, when the Samanids in their turn collapsed after having held the fort for 180 years (A.D. 819-999), and the long-dammed-back flood of barbarian invasion at last broke through, the final stage in the process of conversion went with a run. There were few Zoroastrians left in Khurāsān, and few followers of the Mahāyāna in Transoxania or Afghanistan, by the time when the utterly barbarous Mongols broke in at the heels of the more amenable Turks. This last and most devastating wave of Eurasian Nomad invaders almost obliterated the remnants of the ancient culture in the dominions of the Samanids' Turkish successors the Khwārizm Shāhs; and, if a common Islam, which by that time had superseded the previous sectarian faiths, had not inspired the survivors of the sedentary population between the Jaxartes and the Caspian Gates to present a united front to their alien oppressors, the Syriac Civilization might have perished without a successor. The Iranic Muslim Civilization, which arose out of the ruins of the Syriac Civilization and which succeeded in taking the savage Mongol conquerors captive, unmistakably owed its existence to an Islamic chrysalis.⁵

The conversion to Islam of the Zoroastrian and Buddhist subjects of an empire in which Islam was the hall-mark of the imperial people was not, however, so remarkable as the conversion of the unconquered Zoroastrians of Daylam and Tabaristān, who, in their fastness between the Elburz Range and the Caspian Sea, had preserved their freedom when all the rest of the Sasanian Empire had capitulated to the Primitive

³ See II. ii. 142.

⁴ According to Arnold, op. cit., p. 214, the decisive date in the conversion of Transoxania to Islam was the reign of the 'Abbasid Caliph Mu'tasim (*imperabat* A.D. 833-42).

⁵ See II. ii. 142, 144-50, and 446-52; and pp. 256-7, above.

Arab Muslim armies.¹ Their retention of their ancestral Zoroastrian faith had been the symbol of the successfulness of their resistance; yet in the course of the ninth and tenth centuries of the Christian Era they abandoned Zoroastrianism in favour of Islam on their own initiative. A landmark in this process was the voluntary conversion of the independent prince Karīm b. Shahriyār of the Qābūsi House at the turn of the eighth and ninth centuries of the Christian Era; and there were subsequent mass-conversions in Daylam in A.D. 873 and in both Daylam and Tabaristān *circa* A.D. 912.² It is true that these converts in the Caspian Provinces advertised their independence, even in the act of conversion, by adopting Islam in its heretical Zaydī Shi'ite form;³ yet, even so, this act was a striking manifestation of a desire for solidarity with the rest of their society on the part of a people whose traditional parochialism was inspired and abetted by the physical isolation of their habitat.

In a disintegrating Indic World the effacement of Buddhism by Hinduism seems to have been accomplished by insensible degrees and to have been in progress from perhaps as early as the second century B.C. until as late as the seventh century of the Christian Era—even if we leave out of account the survival of Buddhism in Bengal, where, in the Tantric version of the Mahāyāna, it persisted for some six centuries longer, till the rising tide of Hinduism engulfed its rival here too, thanks to the destruction of the Tantric Buddhist culture in Bengal by the Muslim invaders of the Ganges Valley at the close of the twelfth century of the Christian Era. Yet we can date within narrower chronological limits the period in which, in the Indic World as a whole, Hinduism decisively gained the upper hand. This happened under the Guptan Rāj, which provided the Indic World with an effective universal state (an avatar of the Mauryan Rāj) from the last decade of the fourth century till the third quarter of the fifth century of the Christian Era.⁴ It is perhaps no accident that the Guptan 'Indian Summer', in which Hinduism definitively established itself as the universal religion of a disintegrating Indic Society, was also the eve of the Hun and Gurjara Eurasian Nomad barbarian invasions of Hindustan. At any rate it would appear⁵ that Hinduism in North-Western India, like Islam in North-Eastern Iran, Catholic Christianity in Western Europe, and the Mahāyāna in Northern China, gave a new civilization the possibility of coming to birth by holding together the conquered subjects of a fallen universal state and taking their barbarian conquerors captive.

Hinduism in India and the Mahāyāna in the Far East share with one another the honourable distinction of having achieved their sweeping spiritual conquests of human souls without resorting to the use of physical violence to supplement their preaching. By contrast, in both the 'Abbasid Caliphate and the post-Diocletianic Roman Empire the mass-conversions of a majority of the population to the prevailing higher religion were accompanied by manifestations of exasperation with a residual minority whose obstinate loyalty to its ancestral faith was

⁵ See I. i. 85.

cheating Mankind of a unity in which it was ardently longing to find strength. In the Caliphate this exasperation vented itself in spasmodic popular outbreaks of persecution;¹ but these were never pressed home—as is witnessed by the fact that the persecuted non-Muslim religious minorities were still in existence *in situ* at the time of writing, not much less than a thousand years after the date at which they had first begun to feel the breeze of Muslim intolerance.

In the Roman Empire Christian intolerance took the grimmer form of a systematic official repression of all non-Christian religions except Judaism; and this policy was persistently enforced till it resulted in the *Gleichschaltung* that was its objective.² It is significant that this sinister departure from the Constantinian *modus vivendi* between Christianity and Paganism was made in A.D. 382, four years after the Roman military disaster at Adrianople,³ and that the author of the new militant policy was Theodosius I, who was striving to save the Empire from immediate dissolution. When the news of the great catastrophe of A.D. 378 reverberated through the Roman World, a panic-stricken population—faced with an imminent prospect of seeing the familiar secular social framework of its life fall in ruins about its ears—instinctively closed its ranks round the standard of an oecumenical religious organization that gave promise of being able to weather the storm; and this flustered majority turned with savage resentment upon a minority of archaic-minded grandees and backward peasants who, as the rest of Mankind saw it, were wantonly thwarting Mankind's one hope of social as well as spiritual salvation.

If the foregoing analysis is correct, the transition to the 'gestative' from the 'conceptive' phase of a church's service as a chrysalis is marked by an increase in the impetus of the flow of vitality without any change in its direction. In both these phases a current of psychic energy that can no longer find vent through the choked or shattered institutional channels of a disintegrating civilization is flowing into alternative channels newly opened for it by the church. In the 'conceptive' phase the church is absorbing energy, released by the atrophy of the disintegrating civilization's previous parochial institutions, for which a universal state has failed to provide an outlet; at the transition from the 'conceptive' to the 'gestative' phase the church goes on to absorb the residual energy of the moribund secular society for which the universal state did provide an outlet until its own collapse. In this second phase the church is freighted with all the heritage and all the potentialities of Mankind; and, carrying with it this inestimably precious cargo, it embarks on its perilous passage across the gulf that opens beneath its feet when the fabric of the dead civilization finally dissolves into a social vacuum.

In the quaint but expressive imagery of Islamic Mythology, we may liken the church, in this heroic phase of its history, to the avatar of the Prophet Muhammad as a ram who sure-footedly crosses the bridge—

¹ See V. v. 678, n. 2, and V. vi. 205. The subject is dealt with in greater detail in Tritton, A. S.: *The Caliphs and their Non-Muslim Subjects* (London 1930, Milford), especially chaps. 4 and 9, and in Browne, L. E.: *The Eclipse of Christianity in Asia from the Time of Muhammad till the Fourteenth Century* (Cambridge 1933, University Press).

² See IV. iv. 226-7.

³ See IV. iv. 440-3.

narrow as a razor's edge—which is the only avenue of access to Paradise just because it spans the yawning gulf of Hell. Sinners and unbelievers who hazard the dizzy adventure on their own feet infallibly fall into the abyss; the only human souls that find their way across are those which, as a reward for their virtue or for their faith, are permitted to cling to the miraculous ram's fleece in the conveniently portable shape of beatified ticks.¹ When the crossing has been duly accomplished, the 'gestative' phase in the church's missionary service is succeeded by the 'parturient' phase, and at this second transition the tide in the flow of spiritual energy turns and the roles of church and civilization are reversed. In the 'conceptive' phase the church was drawing vitality from an old civilization within whose framework the church had sprung up; in the 'parturient' phase the church gives out vitality to a new civilization that has been conceived in the church's womb. We can watch this creative energy that has been confined within ecclesiastical bounds during the social interregnum flowing out again, under religious auspices, into secular channels on the economic and political, as well as the cultural, plane of social life.

On the economic plane at the time of writing, by far the most impressive existing legacy of a 'parturient' universal church to an emergent civilization was to be seen in the economic prowess of a contemporary Western World. By that date a quarter of a millennium had passed since a new secular society had completed a long-drawn-out process of extricating itself from the chrysalis of the Western Catholic Christian Church, and seven centuries since the first audacious anti-clerical stroke had been struck by the *Stupor Mundi* Frederick II Hohenstaufen.² Yet the marvellous and monstrous apparatus of Western technology, whose mechanical tentacles were now holding the whole globe in their grip, was a monument of the economic genius of an ecclesiastical Frankenstein; for, when the history of this unprecedented and peculiar Western economic achievement was traced back, it turned out to have originated as a by-product of Western Christian monachism.³ The psychological foundation of this mighty material edifice was a belief in the duty and

¹ An inquiry into the origins of this Islamic myth might carry us far afield and give us light on obscure tracts of religious history. The bridge is manifestly the 'Chinvat Bridge' of Zoroastrian Eschatology (see Nyberg, H. S.: *Die Religionen des Alten Iran* (Leipzig 1938, Hinrichs) (Mitteilungen der Vorderasiatisch-Aegyptischen Gesellschaft (E. V.), 43 Band), pp. 179–86). Is the ram the Cyclops' ram under whose belly Odysseus, clinging to the fleece, passed safely out of the mouth of the Cyclops' cave without being detected by the blinded monster's groping hands? And is this the same ram on whose golden fleece Phrixos safely rode the waves of the Hellespont when his sister Hellë fell off in mid-course and gave her name to the waters in which she perished?

² For the historical significance of the Emperor Frederick II, see pp. 440, 446, and 537–9, below, and IX. viii. 394–5.

³ Mr. Martin Wight comments: 'This is true not only on the social level on which you are discussing it. Is it not more profoundly true on the intellectual level? For does not a Modern Western Science rest on the foundations of a Christian theology and take for granted a Christianised World? "The pre-suppositions that go to make up this "Catholic Faith", preserved for many centuries by the religious institutions of Christendom, have as a matter of historical fact been the main or fundamental presuppositions of Natural Science ever since" (Collingwood, R. G.: *An Essay on Metaphysics* (Oxford 1940, Clarendon Press), p. 227. Compare Berdyaev, N.: *The Meaning of History* (London 1936, Bles), p. 117, and Polanyi, M.: *Science, Faith and Society* (London 1946, Oxford University Press). Compare also the quotation from Gilson on p. 514, below, which makes the same point).'

dignity of physical labour; and this attitude—which was a revolutionary departure from the Hellenic contempt for labour as something vulgar and servile¹—would not have established itself if it had not been hallowed through being inculcated in Saint Benedict's Rule as a means, not of conjuring into existence a titanic 'commonwealth of swine',² but of providing for aspirants to citizenship in a 'commonwealth of God' a discipline in the life of This World that would be propitious for their spiritual endeavours. On this immaterial foundation the Benedictine Order planted the agricultural groundwork of Western economic life, and this groundwork gave the Cistercian Order a basis for the industrial superstructure which their silent activity erected over their monastic folds and fields, until the cupidity that this monk-built Tower of Babel aroused in the hearts of its builders' secular neighbours reached a pitch at which they could no longer keep their hands off it. A spoliation of the monasteries was one of the origins of a Modern Western capitalist economy.

When we pass from the economic to the political plane, we see churches calling into existence new 'commonwealths of nations' and providing the statesmen and administrators required for the government of secular polities.

In a different context³ we have watched the Papacy giving a new political form to a Medieval Western Christendom by moulding it into a *Respublica Christiana* that promised to enable Mankind to enjoy simultaneously the benefits of both parochialism and oecumenicalism without having to suffer from the characteristic drawbacks of either of these hitherto antithetical dispensations. In bringing new communities into the comity of Western Christendom with the political status of independent kingdoms, the Papacy was bringing back into the political life of Mankind the multiplicity and variety that had been so fruitful in the growth stage of the antecedent Hellenic Civilization, while the political disunity and dissension that had brought the Hellenic Society to ruin and its political parochialism into disrepute were to be exorcised, in this new attempt to solve an old problem, by a recourse to the oecumenical authority which the Papacy had inherited from the Roman Empire. The secular parochial princes of a Western Christian World were to dwell together in unity⁴ under the presidency of an ecclesiastical shepherd; and, for the exercise of these political responsibilities, the Pope had sanctions at his command which had been lacking in the Delphic Amphictyony. In the eyes of the subjects of a Medieval Western Christian prince, their ruler's title to their obedience rested on the recognition of his legitimacy by the Apostle at Rome, and the power to bind implied the power to loose.⁵

In a previous Part of this Study⁶ we have observed the tragic breakdown of this Medieval Western Christian ecclesiastico-political experiment, and the course of our inquiry will lead us back to this tragedy

again. At this point we have merely to take note of it as one illustration of the political role of a church in its 'parturient' phase, and to observe the corresponding role played by the Brahman ecclesiastical fraternity in the political articulation of a nascent Hindu Society when the Brahmins conferred legitimacy on Rājput dynasties descended from Hun and Gurjara Eurasian Nomad founders of barbarian successor-states in the former domain of the Guptan Empire by discovering irreproachable genealogies for these casteless interlopers, who could never have passed themselves off as kshatriyas without the aid of the Brahmins' intellectual dexterity and religious prestige.¹

When we pass on to examine the Christian Church's political role in Orthodox Christendom and the Mahāyāna's in the Far East, we see the church's field of activity being circumscribed in both these societies by the evocation of a ghost of the antecedent civilization's universal state—the Sui and T'ang renaissance of the Han Empire in the main body of the Far Eastern Society, and the East Roman renaissance of the Roman Empire in the main body of Orthodox Christendom.² In these circumstances in the Far East the participation of the Mahayanian clergy in secular public life never became more than a passing phase in a particular region. The prospects opened up by their employment in the fourth and fifth centuries of the Christian Era as civil servants in the barbarian successor-states of the Han Empire in its northern provinces, in place of Confucian civil servants who were unwilling to serve a barbarian régime,³ were decisively closed when, in A.D. 589, the South of a nascent Far Eastern World was united politically with the North and when, in the next generation, the Confucian scholar-administrators were enticed by T'ang T'ai Tsung out of their southern citadel to take over the administration of an avatar of the oecumenical empire of the Han.⁴ In Orthodox Christendom the Christian Church's field of political activity had promised in the seventh century of the Christian Era to become what it eventually did become in the West; but in the event the Oecumenical Patriarch Sergius (*fungebatur* A.D. 610–38) proved not to have been the harbinger of an Orthodox Christian counterpart of the Medieval Western Papal ascendancy. In Orthodox Christendom this promise failed to materialize owing to the Emperor Leo Syrus's success in organizing the East Roman Empire in the eighth century and to the re-emergence in the ninth century of a classically educated Christian laity capable of conducting a complicated civil administration without the Church's assistance.⁵

In these altered political and cultural circumstances the fate of the Christian Church in Orthodox Christendom was more ironical than that of the Mahāyāna in the Far East. In the Far Eastern Society from T'ang T'ai Tsung's day onwards the Mahāyāna found a new place for itself as one among a number of religions and philosophies existing side by side and catering, without any mutual exclusiveness, for the divers

⁵ See IV. iv. 344–6.

spiritual needs of the same public; and, just because the Mahāyāna did offer spiritual sustenance that was not to be obtained either from a vulgar Taoism or from an academic Confucianism, it unobtrusively continued to permeate the life of the Far Eastern Society in spite of occasional bouts of repression to which it was subjected by Gallio-like emperors at the instigation of envious-hearted Confucian counsellors.

The continuing importance of the Mahāyāna in this unofficial guise is attested by the part that it played in the cultural conversion of Korea and Japan to the Far Eastern way of life—a part that bears comparison with the role played by the Christian Church in the attraction of Hungary, Poland, and Scandinavia into the orbit of Western Christendom. A comparable role was played by the Eastern Orthodox Christian Church in planting an offshoot of the Orthodox Christian Civilization in the soil of Russia; but in Orthodox Christian history this achievement was exceptional; for, although, to outward appearance, the Christian Church in the main body of Orthodox Christendom had suffered less than the Mahāyāna in the main body of the Far Eastern World from an Hellenic political and cultural renaissance that lacked the self-assurance and the driving-force of the Sinic renaissance in the Age of the T'ang, it had been manoeuvred, as a consequence, into a more invidious position. It would have been happier for the Church to have been disestablished than to be kept in harness, as she was, as the handmaiden instead of the Egeria of a ghost of the Roman Empire; for, in her new official status of subjection to the East Roman state, the Church brought, not peace, but a sword¹ into the international life of an expanding Orthodox Christendom.

The disastrous effect of the Orthodox Church's constitutional position on the relations between the East Roman Empire and Bulgaria after Bulgaria's conversion has been examined in some detail in another context,² and we have also noticed how the ascendancy, of which the Church was disappointed in Orthodox Christendom in the auspicious hour when the new society was in growth, was thrust upon the Church out of due time and beyond due measure after the Orthodox Christian Civilization had prematurely broken down in consequence of the monstrously disproportionate over-development of a nascent state that had established its own ascendancy over the Church.³ When the main body of a broken-down Orthodox Christian Society found itself constrained, as the penalty for its political failure, to accept an indispensable universal state at alien hands, and Greeks and Bulgars were forced into political parity at last as fellow *ra'iyeh* of an Ottoman shepherd, the Oecumenical Patriarch Gennadius and his successors were invested *de jure* by the statesmanship of Sultan Mehmed Fātih with the political authority that had once devolved *de facto* on the Oecumenical Patriarch Sergius at the Roman Empire's nadir in the days of Heraclius. During the period between the Ottoman conquest of Constantinople in A.D. 1453 and the impact of the West at the turn of the eighteenth and nineteenth centuries of the Christian Era, the main body of Orthodox Christendom survived in a state of suspended animation as a *millet* of

¹ Matt. x. 34; cp. Luke xii. 51.

² In IV. iv. 379-405.

³ See IV. iv. 352-71.

the Ottoman Empire with the Oecumenical Patriarchate as its *millet bashy*.¹ In this rôle the Church was once again serving the Orthodox Christian Civilization as a protective ecclesiastical integument, but this time it was not a chrysalis fostering a germ of new life but a napkin enfolding a buried talent.²

While there was no doubt about the part played by the Christian Church in the West in calling a new commonwealth of parochial states into existence at and after the close of the first chapter of Western history in the eleventh century of the Christian Era, it was still, at the time of writing, a debatable question whether—and, on an affirmative answer, to what extent—the church was also the source of the parliamentary representative institutions which began, in the second chapter of Western history, to take shape in a number of Western parochial states. It had been affirmed and denied that these parochial secular rudiments of representative government had been derived from the regional conferences of bishops or had been copied from the oecumenical constitutions of monastic orders. Whatever the truth might be on this point, an historian might feel more confidence in ascribing an ecclesiastical origin to the institutions of self-government in the city-states of the Medieval Western World;³ for it was certain that on the secular plane the civic self-government that had once been the distinctive political feature of the Hellenic Civilization did not survive the post-Diocletianic Age, and was indeed already wilting as far back as the early days of an Antonine 'Indian Summer'—to judge, among other evidence, by the correspondence that passed between the Younger Pliny and the Emperor Trajan when Pliny was governor of the province of Bithynia. By that date a vitality which was no longer finding a satisfactory outlet in secular civic life was flowing into the self-government of the local Christian communities in the municipal cells composing the Roman body politic;⁴ and, though, in the stress of the social interregnum following the dissolution of the Roman Empire in the West, ecclesiastical institutions of local self-government went the same way as their secular patterns, the authoritarian influence exerted on elections of bishops by the incumbents of neighbouring sees and by the secular arm never wholly eradicated the memory of the historical fact that the election of a bishop was traditionally the prerogative of the clergy and people of the diocese. In so far as the development of local self-government in the city-states of a Medieval Western Christendom was due to the stimulus of memories of a similar dispensation in the past, the creative reminiscence was a recollection of an ecclesiastical self-government in the Roman Imperial Age rather than of a previous secular self-government which had passed its zenith as far back as the beginning of the Hellenic Time of Troubles in the fifth century B.C.

¹ See IX. viii. 184-6.

² Matt. xxv. 14-30; Luke xix. 12-27.

³ This Medieval Western renaissance of the Hellenic institution of the city-state is examined further in X. ix. 645-8.

⁴ This underlying connexion between the two phenomena in Bithynia that caused Pliny the greatest concern—the decay of civic institutions and the spread of Christianity—does not seem to have been apprehended by either the conscientious governor or the level-headed emperor.

When we turn to consider the enlistment of ecclesiastical dignitaries in the service of secular governments as statesmen and administrators, we find a sharp divergence between the course of Western and Hindu history on the one side and Orthodox Christian and Far Eastern history on the other.

In Western Christendom at moments of acute political and social crisis—as, for instance, when the Roman Empire was dissolving there in the fifth century of the Christian Era, or after the collapse of the Carolingian Empire in the ninth century—bishops were sometimes constrained by the importunity of their harassed flocks to take over the political as well as the ecclesiastical government of their dioceses. In the fifth century of the Christian Era this burden was thrust upon the shoulders of Apollinaris Sidonius by his Auvergnat compatriots on the eve of the annexation of Auvergne by the Roman Empire's Visigothic successor-state; and the elected magistrates who governed the city-states of Northern Italy from the eleventh century onwards seem to have been the direct political heirs, not of Carolingian counts, but of the local bishops who had stepped into the breach when an over-centralized Carolingian administration had broken down. On the Italian side of the Alps the only local bishop, apart from the Pope, who retained this temporal authority during the later Middle Ages was the Bishop of Trent, on the outermost fringe of the North Italian city-state cosmos. In the less precocious Transalpine regions of Western Christendom prince-bishoprics survived until far into the Modern Age. Within the shrunken confines of 'the Holy Roman Empire' the ecclesiastical principalities of Trent, Salzburg, Passau, Würzburg, Mainz, Trier, Köln, Münster, and Liège—to mention only a few of the most illustrious—were not swallowed up by their secular neighbours till A.D. 1803; and even in the Kingdom of England, where the development of an effective central government had been brought on at an exceptionally early date by the Danish invasions and by the Norman Conquest, the Bishop Palatine of Durham did not lose the last vestiges of the attributes of temporal sovereignty until A.D. 1836.¹

As the counsellors and ministers of secular rulers, the ecclesiastical dignitaries of Western Christendom had had a longer and more continuous career of political activity than as temporal rulers in their own right. It was not, perhaps, surprising to see the government of a barbarian successor-state of the Roman Empire, such as the Visigothic Kingdom in the Iberian Peninsula in the seventh century of the Christian Era, virtually falling into the hands of the local bishops in council. It was more remarkable that, a thousand years later, after the beginning of the Modern Age, when a Transalpine Western Christendom, in the train of a Medieval Italy, had equipped itself with an educated laity, the secular sovereigns of a sixteenth-century England and Castile and a seventeenth-century France should still have been so prone as they were to place their governments in ecclesiastical hands. The bare recital of the names Wolsey, Ximenes, Adrian, Richelieu, Mazarin is enough to remind us of the prominence of ecclesiastics in the political life of the

¹ An Act of Parliament separating the Palatinate jurisdiction from the See of Durham and vesting it in the Crown was passed at Westminster on the 21st June, 1836.

Western World in its Early Modern Age; and the list runs over into a self-consciously secular-minded eighteenth century. In a post-Hapsburg Spain an offshoot of the House of Bourbon burnt its fingers by placing itself in the venturesome hands of a Cardinal Alberoni; in a Bourbon France an archbishop of Toulouse, Étienne-Charles Lomérie de Brienne, was the last prime minister of an expiring *Ancien Régime* before Louis XVI recalled Necker and convened the States-General; and in a post-Bourbon France a Napoleon appointed at his Minister for Foreign Affairs a revolutionary politician who had served his apprenticeship as a bishop under the *Ancien Régime*. A procession of ecclesiastical statesmen that is headed by a fifth-century Roman *vir senatorius* who ended his career as bishop of Auvergne is closed by an eighteenth-century French diplomatist who began his career as bishop of Autun. From the days of Sidonius to those of Talleyrand inclusive, the 'parturient' phase of the Christian Church's service as a chrysalis was drawn out, in Gaul, over a span of more than twelve hundred years.

In the Hindu World the political record of the Brahman Caste was no less impressive. The new commonwealth of parochial states which the Brahmins had conjured up in the eighth century of the Christian Era out of the post-Guptan social interregnum soon fell into a fratricidal warfare, and in the twelfth century this breakdown opened a breach for the entry of successive waves of alien invaders;¹ yet, through all subsequent vicissitudes of Hindu political fortunes, the Brahmins managed to make their services as secular administrators indispensable under the most diverse régimes. When a disintegrating Hindu Civilization entered into its universal state, Brahman agents—from junior clerks upwards to ministers of state—were employed by the Mughal Rāj and the British Rāj in succession. Akbar ruled India through the agency of Mahēsh Dās (*alias* Rājā Bīrbal), and in A.D. 1952 a Kashmīrī Brahman, Jawaharlal Nehru, was serving as the first Prime Minister of the British Rāj's newly established Hindu successor-state.

When we turn to the histories of the Orthodox Christian and Far Eastern civilizations, the picture changes. In the main body of Orthodox Christendom the Oecumenical Patriarch Sergius's effective intervention in secular politics in the reign of the Emperor Heraclius (*imperabat* A.D. 610-41) was, as we have seen, a flash in the pan; thereafter, the Oecumenical Patriarchate went into a political eclipse that lasted for more than eight hundred years; and, even when Mehmed the Conqueror found it convenient to turn this ancient Orthodox Christian ecclesiastical institution to the political account of an alien régime, he entrusted Gennadius with the management, not of the Ottoman Empire itself, but merely of its largest subject community, the *Rûm Milleti*. In the seventeenth and eighteenth centuries of the Christian Era the Ottoman Government did bring itself to employ unconverted Greeks as ministers of state,² and it recruited these Dragomans of the Porte and Dragomans of the Fleet from the Patriarchal coterie in the Phanar at Constantinople; but these Christian Greek Ottoman high officials were invariably laymen. In a nascent Far Eastern Society the Mahayanian clerical administrators

¹ See IV. iv. 99.

² See II. ii. 222-8.

in the service of the barbarian successor-states of the Han Empire in the North played a political part not unlike that of the Catholic Christian bishops in Visigothic Spain; but, unlike their Western Christian counterparts, they had no successors. No Buddhist Richelieu found service with the Ming and no Buddhist Talleyrand with the Manchus.

The picture changes again, however, when we pass from the political to the cultural plane; for a Mahāyāna which was driven out of the Far Eastern political arena so decisively by a resurgent Confucian School of scholar-administrators in the Age of the T'ang reasserted itself in the intellectual field in the Age of the Sung. The five Far Eastern philosophers, culminating in Chu Hsi,¹ who, in the course of the eleventh and twelfth centuries of the Christian Era, created a new system of metaphysics and ethics in the belief that they were rediscovering the original meaning of the Confucian Classics, owed less to the authentic Confucian canon than to a Mahayanian *Weltanschauung* which by their day had so subtly permeated the intellectual atmosphere of the Far Eastern World that it could govern the thought of minds that were set upon ignoring or repudiating it.²

This enduring intellectual potency was part of the heritage of the Mahāyāna from a Primitive Buddhist school of philosophy of which this higher religion was a metamorphosis.³ In contrast to the Mahāyāna, Christianity had started life without any philosophical system of its own, and had subsequently found itself constrained to attempt the *tour de force* of presenting its faith in the alien intellectual terms of the Hellenic schools in order to commend itself to the intellectually cultivated upper stratum of the Hellenic Society.⁴ In Western Christendom this Hellenic intellectual alloy in Christian thought became overwhelmingly dominant after it had been reinforced in the twelfth century by the 'reception' of Aristotelianism into a Western Christian theology;⁵ and, though the Christian Church did make a most effective contribution to intellectual progress in the West by founding and fostering the Western universities,⁶ it was not in the intellectual so much as in the artistic sphere that the cultural influence of Christianity on the Western Civilization made itself felt. In the West, the liturgy of the Christian Church was one of the roots of a secular literature⁷—first in the Latin that was the sacred language of the Church in the domain of the Patriarchate of Rome,⁸ and thereafter in a galaxy of living vernacular tongues that burst out of their Latin swaddling clothes in the twelfth century as buds break into flower in spring.⁹

¹ See II. i. 202-3.

² See, for example, Fung Yu-lan: *A Short History of Chinese Philosophy* (New York 1948, Macmillan), pp. 254 and 268. In the present study the Neoconfucian renaissance of the Confucian philosophy is examined further in X. ix. 40-45.

³ See V. v. 133-6.

⁵ See X. ix. 45-48.

⁷ Another root of the secular literature of the Western World was the heroic poetry inspired by the experiences of the Western Christian barbarian invaders of the Andalusian Umayyad Caliphate in the Iberian Peninsula (see V. v. 259-61).

⁸ The renaissances of an extinct Hellenic secular literature—in a Latin dress in Western Christendom and in a Greek dress in Orthodox Christendom—are examined further in X. ix. 60-67.

⁹ There was no such flowering of a new vernacular in the main body of Orthodox

(b) THE INADEQUACY OF THE CHRYSALIS CONCEPT

We have now perhaps carried our analysis far enough to warrant the conclusion that, in each of the eight cases that have been the subject of our inquiry so far, a church had in fact served as a chrysalis which had absorbed energy emitted by a disintegrating civilization and then, in the fullness of time, had transmitted this store of energy to another civilization that had germinated in the missionary church's womb. If this conclusion is correct, the conception of a church as a chrysalis is borne out by the phenomena in so far as we have considered them up to this point; but we have still to ask ourselves two questions: First, does the transition from an 'apparented' to an 'affiliated' civilization invariably take place by way of a chrysalis church? And, second, even in a case in which a church has demonstrably served as an instrument for furthering the process of the reproduction of civilizations, does it follow that this service is the be-all and end-all of the church by which it has been rendered? Can we be sure that this is as important an event in the history of the chrysalis church as it manifestly is in the history of the emergent civilization? Its importance for the church itself must be outstanding if we are to be justified in taking this service as the key to the church's historical function and significance. Yet it is conceivable that, in the church's history, this may be a minor episode, if not a major aberration. Evidently our inquiry is not yet at an end. We must carry our analysis further.

If we examine more closely our eight cases in which the transition from an 'apparented' to an 'affiliated' civilization had been made by way of a chrysalis church, we shall see that in all of them the 'affiliated' society had been a civilization of the third generation and the 'apparented' society one of the second generation.¹ The Western Civilization and the Orthodox Christian, both in its main body and in its Russian offshoot, are affiliated to the Hellenic, which in its turn is affiliated to the Minoan. The Iranic and Arabic Muslim civilizations are affiliated to the Syriac, which is affiliated to the Minoan, as the Hellenic is. The Hindu Civilization is affiliated to the Indic, which in its turn is undoubtedly affiliated to the so-called 'Indus Culture', whether this is to rank as a distinctive civilization in its own right, or whether it is to be classified as an offshoot or a colonial version of the Sumeric Civilization.² Moreover, the progress of archaeological discovery, which had brought a not merely buried but also forgotten 'Indus Culture' to light within the lifetime of the writer of this Study, had subsequently verified and vindicated the Sinic tradition that there had been a 'Shang Culture' in the Yellow River Basin before

Christendom; for here the renaissance of Hellenism was as potent, and as blighting, in literature as it was in philosophy (see X. ix. 73-75). The spark of medieval Greek epic poetry that was struck out by the border warfare between the East Roman Empire and the 'Abbasid Caliphate did not kindle a flame; and the heroic poetry of the Russian barbarian invaders of a crumbling Khazar Empire and the Greek and Serb barbarian invaders of a crumbling Ottoman Empire was likewise abortive (see V. v. 252-9, 288-9, and 296-301). Since the Comnenian Age the vernacular literature of Orthodox Christendom had sprung, not from native roots, but from exotic Western slips and cuttings.

¹ See the table in I. i. 131-2.

² See I. i. 104-9.

the rise of a Sinic Civilization there in the Chóu Age;¹ and by the year A.D. 1952 the disinterment of this buried but never forgotten pre-Sinic Shang Culture had been carried far enough to warrant a student of History in concluding that the Far Eastern Civilization, both in its main body in China and in its offshoot in Korea and Japan, resembled its living contemporaries in being a civilization of the third generation—seeing that the Sinic Civilization, to which the Far Eastern was affiliated, had now proved to be affiliated in its turn to an antecedent Shang Culture which could no longer be dismissed as being merely legendary.² This impressive uniformity suggests that the reproduction of civilizations through the agency of chrysalis churches may be a special feature of the transition from civilizations of the second generation to those of the third.

If we test this conclusion by reckoning the generations from the standpoint, not of the 'apparented' and 'affiliated' civilizations, but of the chrysalis churches, we shall find ourselves arriving at the same uniform result; for the four churches—Christianity, Islam, Hinduism, and the Mahāyāna—which served as chrysalises in the eight cases of reproduction that we are examining, had been, every one of them, the creation of the internal proletariat of a civilization of the second generation. Christianity and the Mahāyāna stood in this relation to a disintegrating Hellenic Society,³ Islam to a disintegrating Syriac Society,⁴ Hinduism to a disintegrating Indic Society. Moreover, in the two churches—namely Christianity and the Mahāyāna—in which the creative spark of life had been derived from a source outside the society by whose internal proletariat the church had been established,⁵ this alien source had likewise been a civilization of the second generation. Christianity had been inspired by the Syriac, and the Mahāyāna by the Indic, Civilization; and the Syriac and Indic societies, like the Hellenic Society within whose social framework Christianity and the Mahāyāna both grew up, were civilizations of the second generation.

Not all civilizations of the second generation, however, had become apparented to civilizations of the third generation through a chrysalis church. The achievement of this by the Indic Society, for instance, had not been emulated by any of its three sister civilizations. The abortive

¹ The place of this Shang Culture in the history of the civilizations is examined further in X. ix. 375, 694, n. 3, and 696, n. 1.

² This confirmation of a Sinic tradition through the disinterment of material remains that the Shang Culture had deposited during the last phase of its history was an archaeological addition to historical knowledge which, in bringing to light a previously unauthenticated 'cycle of Cathay', called for a change in the classification in previous Parts of this Study. In the table in I. i. 131 the Sinic Society should be transferred from the group of societies unrelated to earlier societies (e.g. the Minoan, Sumeric, and Mayan) to the group of 'infra-affiliated' societies (e.g. the Indic, Hittite, Syriac, and Hellenic); in the table on p. 133 in the same context the Sinic Society should be transferred from the second to the fourth line. In II. i. 318-21 the genesis of the Shang Culture, not the genesis of the Sinic Civilization, should be equated with the human response to the physical challenge of the Middle and Lower Yellow River Basin.

³ For the relation of the Mahāyāna to the Hellenic Civilization, see V. v. 134-5, 361-3, 371, and 482-3.

⁴ Islam was given its historic form by the Syriac internal proletariat, though the Arabian social milieu in which the Founder lived and died was a section of the external proletariat of the Hellenic World (see II. ii. 287-8; V. v. 127-8 and 672-8).

⁵ See I. i. 57.

First Syriac, Hittite, and Babylonian societies all passed away without generating successors; and, though the internal proletariat of the Babylonian Society did succeed in creating two higher religions—Judaism and Zoroastrianism—these embryonic universal churches both missed fire through being diverted to serve the militant political purpose of championing the Syriac Civilization, from which they had derived their inspiration, against an intrusive Hellenism.¹ Thus, even in the transition from the civilizations of the second to those of the third generation, the epiphany of a chrysalis church is not an invariable feature; and, if we now extend our survey first backwards in time behind the second generation and then forwards beyond the third generation, we shall find the picture changing. In the affiliation of the Hellenic and Syriac civilizations to the Minoan Civilization, and of the Indic Civilization to the Sumerian or to the Indus Culture, there is no trace of any chrysalis church performing the service which was rendered by Christianity, the Mahāyāna, Hinduism, and Islam in the next chapter of the story, when the Hellenic, Sinic, Indic, and Syriac civilizations in their turn reproduced their kind in a third generation.

In an earlier passage² we have considered the possibility that Orphism might be a vestige of an almost obliterated universal church, emanating from a Minoan internal proletariat, which then would have done for a nascent Hellenic Civilization what Christianity was to do in the next generation for the Orthodox Christian and Western civilizations. But on second thoughts³ we have inclined to the view that Orphism was not a legacy inherited by the Hellenic Society from a Minoan past but was an artificial and somewhat academic product of Hellenism itself in the Achaemenian Age when, on this view, Orphism was self-consciously manufactured by sophisticated Hellenic souls which had been made aware of a spiritual void in their own social heritage by a sudden revelation, through the conductive medium of the Achaemenian Empire, of the spiritual riches of Syriac religion and Indic philosophy.

If we turn from an almost unknown Minoan to a rather less obscure Sumerian history in its disintegration phase, a glimmer of light here enables us just to discern the emergence of the rudiments of a higher religion from an idolatrous worship which the inventors of Agriculture had paid to their own astounding handiwork.⁴ The worship of a god who dies for his worshippers, and of a goddess who is the dying god's mother and also his bride, seems to have been communicated by a disintegrating Sumerian Civilization not only to its Hittite and abortive Syriac successors and to its Egyptian neighbour but to barbarian and primitive peoples beyond the pale of Civilization up to the extreme north-western bounds of the Old World.⁵ This Sumerian worship of

¹ See V. v. 117-26.

³ See V. v. 82-87 and 697-8 and X. ix. 738-40.

⁴ See III. iii. 256-9.

⁵ See I. i. 115, n. 1, and V. v. 149-50. Henri Frankfort, in *Kingship and the Gods* (Chicago 1948, University of Chicago Press), pp. 286-94, sets out to disprove Sir James Frazer's assumption—which has been followed in the present Study throughout, and especially in V. v. 147-52—that the worships of Tammuz, Adonis, Osiris, and Attis are so many variants of a single religion. To the present writer's mind, Frankfort's

Tammuz and Ishtar had perhaps been the first institutional embodiment of a new spiritual insight that was so deep and significant that it was still to be found at the heart of the higher religions that were living and working in the *Oikoumenê* in the twentieth century of the Christian Era. Ishtar—the goddess who was at the same time ‘virgin, mother and queen’¹—lived for followers of the Mahāyāna in Kwanyin as well as for Christians in Mary, while Tammuz lived in Amitabha as well as in Husayn and in Christ.² The inchoate Sumeric higher religion which was eventually to bear this precious spiritual fruit does not, however, seem to have lent itself in its infancy to the mundane social task of serving as a chrysalis in the transition from a Sumeric to a Hittite or an abortive First Syriac Civilization. When the curtain rises on a Hittite World whose infancy was still obscure to historians in A.D. 1952, we find the gods of the ‘apparented’ Sumeric Society sharing the field with the gods of the north-western barbarians who had brought a new civilization to birth by overrunning the Anatolian provinces of a dissolving Sumeric Empire of the Four Quarters.³ The Anatolian cult of Ishtar had to wait until the Hittite Civilization, in its turn, had gone down to Sheol before the introduction of the Sumeric goddess into the Hellenic World under the name of Cybele by a Hittite contingent of the Hellenic internal proletariat enabled her worshippers to compete with those of Isis, Mithras, and Christ for the privilege—or *corvée*—of providing a chrysalis for the transition from a declining Hellenic Civilization to successor societies of the same species.

In the Egyptiac World, where the Sumeric pair of divinities acclimatized themselves under the names Osiris and Isis, their worshippers did, if Breasted is right,⁴ come within an ace of creating a proletarian church which might have conjured a new civilization out of the social interregnum that followed the break-up of ‘the Middle Empire’. But this denouement, which would have anticipated by a whole generation the performance of the chrysalis role by Christianity, the Mahāyāna, Hinduism, and Islam, was prevented at the last moment by an *union sacrée* between the hitherto mutually antipathetic and hostile religions of the Egyptiac internal proletariat and dominant minority against the alien religion of the intrusive barbarian Hyksos; and, in consequence, the Egyptiac Civilization was able to double the natural term of its life, at the cost of renouncing the possibility of reproducing its kind.

It thus appears that the intervention of a church in the role of chrysalis,

arguments against the Frazerian view are less convincing than those in favour of it, which are summarized as follows by Frankfort himself with admirable candour:

‘One must start by conceding that it is possible to recount a myth of a dying god which contains features common to the myths of Egypt, Mesopotamia and Syria. His story would run like this: The god was killed by an enemy in the guise of a boar (Adonis) or symbolised by the boar (Osiris, Marduk). Moreover, the god’s body floated upon the water, or he was said to have drowned (Osiris, Tammuz), or his blood stained the water of a river (Adonis). His death brought about the stagnation of all natural life; a goddess bewailed him and set out to retrieve him. The god was found and liberated, sometimes with the aid of his son (Osiris, Marduk, Enlil). With his resurrection, Nature, and especially all vegetation, revived. . . . Furthermore, it has been maintained that the names of Osiris and Assur, and the epithet “Asaru” borne by Marduk, may be derived from a common root’ (Frankfort, *op. cit.*, pp. 287 and 293).

¹ Goethe: *Faust*, Part II, ll. 12102–3.

² See V. vi. 276.

³ See V. v. 266.

⁴ See I. i. 140–3 and V. v. 150–2.

which was a normal occurrence in the transition from civilizations of the second generation to their successors in the third generation, had never occurred in the corresponding transition to the second generation from the first. No such phenomenon had attended the exits of either the Sumeric and Egyptiac or the other primary civilizations, namely the Minoan, the Andean, and the Mayan; and, in passing, we may note that, so far as we know, the New World had never given birth to any indigenous higher religion in any chapter of the history of civilizations there.

If we now extend our survey in the opposite direction in Time, and review the latter ends of the civilizations of the third generation, we shall find that in this chapter of the story too, down to the time of writing, there had been no examples, and few auguries, of a repetition of the process of reproduction by way of chrysalis churches. This difference from the preceding chapter was not due to an absence of those circumstances that had been the predisposing conditions when the Christian Church, the Mahāyāna, Hinduism, and Islam had been created by the internal proletariats of disintegrating civilizations of the second generation; for, whatever might be the state of the Western, Iranic Muslim, and Arabic Muslim societies in the twentieth century of the Christian Era,¹ each of the five other surviving civilizations had by that time given unmistakable proof of being in disintegration by having entered into a universal state; yet these five civilizations, between them, had failed to produce a crop of higher religions that could compare with their predecessors' religious harvest at a corresponding stage in their history, and the balance is not redressed if we add to the catalogue the meagre symptoms² in a Western World whose disintegration could not, in A.D. 1952, yet be taken for granted.

Of the rudiments of higher religions that had been thrown up by one or other of the eight civilizations that were still alive in the sixth decade of the twentieth century of the Christian Era, some had stultified themselves by going into politics and resorting to violence, while others, which had refrained from stultifying themselves in this way and had persisted in a gentle course, had then after all stultified themselves nevertheless by falling into the trap that had once ensnared the Osirian Church in the Egyptiac World. These persistently gentle religions had carried their practice of non-violence to the point of depriving themselves of their *raison d'être* by becoming reconciled to a dominant minority whose failure to save society had called them into existence to stand in the breach. These miscarriages have come to our notice already in our survey of internal proletariats and their works,³ and in this place we have merely to remind ourselves of episodes that have been touched upon already there.

An outstanding example of self-stultification through resort to force was presented in Hindu history by Sikhism,⁴ a would-be synthesis of Hinduism with Islam which had started by practising fraternity as a corollary to its preaching of monotheism, had gone astray through allow-

¹ The prospects of the Western Civilization are discussed in XII. ix. 406-644.

² See V. v. 188.

³ See V. v. 58-194.

⁴ See V. v. 106.

ing itself to become the sectarian faith of militant founders of a successor-state of the Mughal Rāj, and had come eventually to be little more than the distinctive mark of a community that had virtually become another Hindu caste. The more romantic fate of perishing with the sword that they had misguidedly drawn had been suffered in China under the Manchu Empire by the T'ai P'ing¹ and in the main body of Orthodox Christendom under the Ottoman Empire by the followers of Sheykh Bedr-ed-Dīn and thereafter by the adherents of a resurgent Imāmī Shi'ism,² while the Bektāshī movement had steered clear of this particular wrong turning, only to sacrifice its oecumenical mission for the sake of becoming, first a regimental badge for the Ottoman Janissary Corps, and afterwards a national heterodoxy for Albanian barbarians³ whose war-bands had just missed their manifest destiny of entering into the heritage of an Ottoman Empire in dissolution.⁴

In the Western World an ideal of social justice had lured a Christian sect into seeking to anticipate God's work by drawing the sword when the militant wing of the Anabaptist movement had seized the Tyrolese city of Brixen in A.D. 1528 and the Westphalian city of Münster in A.D. 1534;⁵ and it was the same impatience to put down the mighty from their seat and to exalt the humble and meek⁶ that had found vent, in a semi-Westernized Russia in A.D. 1917, in a similar recourse to violence in which a band of militant Marxists had seized, not one city, but an empire, and had victoriously maintained their hold on their huge prize against the hostile world in arms to which their Anabaptist forerunners had quickly succumbed. Like a latter-day Mahayanian Buddhism, this latter-day Marxian Communism could neither be classified correctly nor understood aright as anything but a religion; for, though Marxism, too, was a metamorphosis of a philosophy, and though its exponents vehemently denounced and repudiated Religion in general and Christianity in particular, the Marxian myth, faith, and hope all betrayed their Christian origins,⁷ and the Marxian mission to preach the gospel to every creature⁸ ran true to type by stultifying itself, as other once oecumenical-minded religious movements had stultified themselves in their day, when it enlisted in the service of a secular state.

In a previous Part of this Study, written before the General War of A.D. 1939-45,⁹ it has been suggested that, in a Westernizing World which

¹ See V. v. 107.

² See V. v. 111.

³ See V. v. 295.

⁴ See IV. iv. 76-77.

⁵ See V. v. 167 and 170. Mr. Martin Wight points out that, in the history of Western Christendom, 'the first violent Christian social revolutionaries to make a big stir were the Bohemian Taborites of the early fifteenth century, and' that 'the tradition to which they and the Anabaptists belong can be traced back to the Patarines of Milan. It goes back ultimately, perhaps, to such primitive Christian Futurists as the Montanists and the Circumcelliones, whose centre of interest, however, was not social justice on 'This Earth so much as apocalyptic expectation or personal salvation.' Mr. Wight also points out that Reinhold Niebuhr 'has something like' the 'distinction between "violent" and "gentle" reactions in an internal proletariat in his distinction between "hard utopians" and "soft utopians" among Christian sectaries'. See his *Faith and History* (New York 1949, Scribner), pp. 205-13.

⁶ Luke i. 52.

⁷ See V. v. 177-9. For a further discussion of the affiliation of Marxism to Christianity, see Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1933* (London 1934, Milford), p. 121, n. 2, and *Survey, 1934* (1935), p. 355, n. 3, and p. 373.

⁸ Mark xvi. 15.

⁹ See V. v. 179-85.

at that time, on the political plane, was still a house of many mansions, Marxism might be heading towards the prosaic destination that Sikhism, Imāmī Shi'ism, and Bektashism had each already reached in becoming the national religion of a parochial state. By the year A.D. 1952 Mankind had seen the number of Great Powers in the World reduced to no more than two through the cumulative effect of two world wars in one lifetime,

in dubioque fuere utrorum ad regna cadendum
omnibus humanis esset terrâque marique.¹

Communism, now dominant by force over one of two political spheres between which the World had come to be partitioned, now appeared to be playing for the supreme stakes of world power or downfall; yet in essence its prospects were unchanged; for the compromising subservience to the Soviet Union, into which the Communist Movement had fallen during the inter-war years as a result of its brilliant politico-military success in seizing and holding the Russian Empire by force, had been confirmed and intensified by the outcome of the Second World War. This picture had not been changed in its essence by the capture of China in A.D. 1948-9, which had been another brilliant politico-military success in Communism's career; for this had only harnessed Communism to a second Great Power and thereby given Communism the role of serving as the ideological expression of a temporary coincidence between Chinese and Russian political interests. If the Soviet Union was destined to provide a Westernizing World with its universal state, no doubt Communism would be rewarded for its alliance with the state which, in that event, would be the single surviving Great Power. The Soviet Union's established 'ideology' would then be imposed on the World as its official faith; but, whatever might or might not be the Soviet Union's prospects of attaining world-wide dominion, it could be forecast with confidence, in the light of the historical precedents,² that Communism's reward, if it were ever to be won, would prove to be Dead Sea fruit; for the Human Heart is the only realm on Earth in which a religion can reign, and nothing so surely alienates the Heart as an attempt to force an entry into it by breaking the will with the bludgeon of political coercion.

This completes our tale of the new religions, thrown up by the surviving civilizations, that appeared in A.D. 1952 to have compromised their spiritual prospects by going into politics and resorting to force. The alternative snare, into which the meek are prone to fall, of coming to terms with an unregenerate dominant minority and allowing themselves to be drawn into its ranks and insensibly influenced by its *êthos* appeared, by the same date of observation, to have entangled most of the rest of the nascent new higher religions that might otherwise perhaps have been capable of providing chrysalis churches if the process of the reproduction of civilizations was to repeat itself by that means.

The popular adaptations of the Mahāyāna which had sprung up among the internal proletariat of a Japanese offshoot of the Far Eastern

¹ Lucretius: *De Rerum Natura*, Book III, ll. 836-7, quoted in V. vi. 135 and in XII. ix. 484.

² For these, see V. v. 646-712.

Society during its Time of Troubles¹ had in the subsequent universal state been fused by a severely authoritarian Tokugawa régime into a spiritual amalgam with an exotic Confucianism and an archaistic Shinto;² and in this Japanese syncretism the popular hope of salvation by faith in the power of a compassionate-hearted Amida had been swallowed up in the philosophic self-discipline of a dominant minority and the primitive self-worship of an artificially insulated fraction of Mankind. In the Hindu World an attempt, in the shape of the Brahmō Samāj, at a synthesis between Hinduism and Christianity³ had been diverted, not by the flagrant militancy that had been the bane of the Hindu-Muslim Sikh Khālsā, but by the more insidiously corrupting attractions of an exotic middle-class Western way of life under a British Rāj. In the Western World itself the same ironic spiritual penalty for social virtue had overtaken the non-militant Mennonite and Moravian Anabaptists⁴ and their kindred spirits in the Society of Friends⁵ during the lull between the Wars of Religion and the Wars of Nationality.⁶ In that liberal and utilitarian age the epigoni of Elizabethan and Jacobean saints and martyrs had been captivated by a Georgian and Victorian prosperity and respectability; and the anaesthetic spiritual atmosphere of a bourgeois 'commonwealth of swine'⁷ had stilled the pricks, and thereby blunted the creativity, of an ancestral faith in which the spark of divine fire had first been kindled by tribulation. In the United States the fascinating mirage of a middle-class Earthly Paradise which had been conjured up there at the North and in the West since the Civil War of A.D. 1861-5 seemed to be exerting an effect even on the *anima naturaliter Christiana* of an 'under-privileged' Negro minority, still battered down in the sump of an alien society, whose traditional rendering of the religion which their forefathers had received from their White masters had been inspired by the agonizing experiences of deracination and enslavement.⁸

When we have discounted the prospects of those living higher religions whose adherents had turned either savage or soft, we are left with a couple of heterodox versions of Islam—the Bahā'iyah and the Ahmadiyah⁹—as the only competitors still in the field, midway through the twentieth century of the Christian Era, for the role of supplying the Western Civilization with a chrysalis church.

These negative findings of our inquiry did not, of course, prove conclusively that History was not going to repeat itself in this case. Within the lifetime of the writer and his readers the rational and comfortable life that had been lived by a privileged minority in the leading countries of the West in the eighteenth and nineteenth centuries of the Christian Era had been shown, by the shattering cumulative effect of two world wars in one lifetime, to have been something local, transitory, and exceptional, and not the dawn of a mundane millennium for which its

dazzled beneficiaries had mistaken it. If the advent of prosperity had banked down the fires of religion, the recurrence of adversity might fan them into flame again. And, even apart from the change of outlook which the catastrophes of the twentieth century had brought in their train, it was manifestly still too early to make any confident prophecy about the religious destinies of the Western World. Denizens of that world half-way through that century were not in a position to tell whether the Western Civilization was already in disintegration or was still in growth. Even if it should prove to have already broken down, the one thing certain about its condition was that it had not yet entered into a universal state; and, even if it should prove to have been, at that moment, so far gone in decline as to be on the verge of political unification under a *pax oecumenica*, a comparison with the situation in other societies of the same species at a corresponding stage of their history would suggest that the contemporary observer was most unlikely to be able to foresee the shape of spiritual things to come. In the Hellenic World on the eve of the Augustan Peace, in the lifetime of Cicero (*vivebat* 106-43 B.C.) and Julius Caesar (*vivebat* 100-44 B.C.), who could have cast the horoscope of a still unborn heterodox offshoot of Judaism? And, in the Sinic World in the generation before Ts'ing She Hwang-ti's, who could have guessed the role that was to be played in the last chapter of Sinic history by a Mahayanian church which at that date had still to arise out of a Primitive Buddhist philosophy through an encounter between three occidental civilizations whose very existence was unknown to the Sinic World of the third century B.C.?

In the light of these historical parallels it would have been rash in the twentieth century of the Christian Era to pronounce dogmatically that the Bahā'ī and Ahmadi movements—exotic and insignificant though they might appear to be at this time—were incapable of playing, in a later chapter of Western history, the role of Christianity in Hellenic history and of the Mahāyāna in Sinic. It would have been rasher still to declare that this part would not be played by some religion that, in the sixth decade of the twentieth century, was still unborn. In and after the General War of A.D. 1939-45 the social scourge and personal catastrophe of deracination had smitten the Western World, for the first time in its history, with a violence that was comparable, scale for scale,¹ with its

¹ The mass movements of deportation, flight, and expulsion in the vast areas in Europe, Russia, and China that came under the power of hostile foreign invaders during these years, at one stage or another of the war and its aftermath, were the most conspicuous but perhaps not the most significant features in the picture. We have also to bear in mind that the soldiers in the invading and the liberating armies were separated from their homes and families for years on end as both combatants and prisoners of war. In countries that were bombed without being invaded, there was a vast exodus of children, industrial workers, and civil servants from the cities to the countryside. And even the United States, which was unique among the major belligerents in remaining exempt from the direct devastation produced by military operations, was far from being exempt from the malady of deracination and its psychological effects. Apart from the temporary uprooting of the millions of young Americans who served in the armed forces in Africa, Europe, Asia, and the Pacific, the enormous industrial war effort of the United States was achieved at the cost of a general post of industrial workers over the vast area of the Continental United States, and even the rural population of previously stagnant agricultural areas was drawn into this war-time economic vortex. In 'the Old South', for example, the war of A.D. 1941-5 produced a radical agrarian revolution that was economic, social, and personal at the same time. In this great region in the course

ravages in the Babylonian and Syriac worlds in the eighth, seventh, and sixth centuries B.C. and in the Hellenic World in the last two centuries before the beginning of the Christian Era; and an experience of tribulation which had been so potent in its spiritual effects in each of these other two cases was perhaps unlikely to be altogether barren of similar consequences in the history of the Western Civilization. Yet, even when the wary historian had made these circumspect reservations, he would still have to report that, within his limited range of vision, there was at any rate no positive indication that History was going to repeat itself in this case by producing another generation of civilizations through the agency of another generation of chrysalis churches.

We have now perhaps carried our survey as far as our knowledge and understanding allow in either direction from our point of departure, which was the service rendered by churches as chrysalises in the transition to the eight still living civilizations from their four progenitors. In the perspective which this reconnaissance has opened up for us, one conclusion seems clear. This chrysalis-church mechanism for the reproduction of civilizations had been the exception, not the rule. Though this species of human society that we call 'civilizations' had been in existence, up to date, for no longer than some five or six thousand years, societies of this species had reproduced themselves at least twice over already, and might repeat the performance again for all that a twentieth-century Western student of History could tell; but it was only in the genesis of one out of these successive litters of civilizations that the process of reproduction had taken this particular form. A previous litter had been produced without the aid of chrysalis churches, and there was no reason for supposing that subsequent litters might not be produced without it likewise. Chrysalis churches were evidently not a necessity of life for the species of society known as civilizations; and this observation suggested that, conversely, the species of society known as churches could not have come into existence simply in order to perform this service. While History testified that the four living churches had in fact performed this service on one occasion, it also indicated that this episode in the careers of these churches might have been incidental and perhaps even accidental. If this was the truth, it signified that the historic role of these churches as chrysalises for civilizations told a historian no more than their fabulous role as cancers told him about the essence of their nature, mission, and prospects. In our search for this ultimate objective of our inquiry, we have once again drawn blank. If we are to continue our investigation, we must make a fresh start from quite a different premiss.

of these few years, man-power and horse-power were largely replaced by machine-power, and the less competent or less fortunate of the former inhabitants were uprooted from the land and swept up into the cities. The consequent immediate increase in economic efficiency and productivity was calculable and gratifying; the ultimate psychological and moral costs were obscure and redoubtable.

(III) CHURCHES AS A HIGHER SPECIES OF SOCIETY

(a) A REVISION OF OUR CLASSIFICATION OF SPECIES OF SOCIETY

A Reversal of Roles

In our inquiry into the relation between churches and civilizations up to this point, we have tacitly worked on the assumption that in the interplay between societies of these two species the civilizations had been the protagonists and that the role of the churches, whether usefully subsidiary or obnoxiously corrosive,¹ had, on either interpretation, been secondary and subordinate. Now that our operations on these lines have proved fruitless, let us try the effect of reversing our point of view. Let us open our minds to the possibility that the churches might be the protagonists and that vice versa the histories of the civilizations might have to be envisaged and interpreted in terms, not of their own destinies, but of their effect on the history of Religion.

As our opening operation in this alternative line of inquiry, let us combine our previous tables of higher religions² and civilizations³ into a single conspectus and see what conclusions this visual presentation of our problem yields us on our new working hypothesis.

The order in which the representatives of three species of human society are set out in the resultant new table⁴ is in the first place a chronological one. The primitive societies, as we have noticed in another context,⁵ must be actually older than Mankind itself; for, if the pre-human progenitors of the Human Race had not already become social animals, it is hard to imagine how they could have been transfigured into human beings.⁶ After Man had become human, he continued to live

¹ A third variation on this assumption, in which the role attributed to the churches is ineptly conservative, is examined on pp. 692-700, below.

² See the table in vol. vi, on p. 329.

³ See the tables in vol. i, on pp. 131-3 and 186.

⁴ Table IV, folding out opposite p. 772, below.

⁵ In I. i. 173.

⁶ The original draft of this sentence ran: 'if the pre-human progenitors of the Human Race had not already become social animals, it is hardly conceivable that they could have achieved the still more difficult feat of turning into human beings.' In this form the passage provoked a challenge from Mr. Martin Wight which led the writer to substitute the present text. Mr. Wight's challenge, however, cuts too deep to be parried by any mere change of words; and the writer would not be dealing frankly with his readers if he did not quote it in full and did not attempt to answer it explicitly.

'This', Mr. Wight comments with reference to the original draft, 'is difficult to follow because the reader is not clear what you regard as the specific differentiae of Man. At several places below you use traditional language in this connexion, saying that Man is "made in God's image" (p. 469, below), possesses a "moral faculty" (p. 470), and is the sole vehicle of "spiritual values" (p. 562, below). Such language suggests that Man was created by God, viz. that at some point in the evolutionary biological process (if we accept that hypothesis) God created a creature different in kind from what went before by endowing it with a soul. See in this connexion the "Platonic myth" in C. S. Lewis: *The Problem of Pain* (London 1940, Centenary Press), pp. 65-68. Now, on such a view, the sociality of Sub-Man is irrelevant. To endow a single individual with a soul, i.e. to make him "in God's image", and then to give him "an help meet" (Gen. ii. 20), was quite enough to start the Human Race. Incidentally the quotation from Eduard Meyer in I. i. 173, n. 3, does not seem to clinch the matter. Speech is "the first thing that makes Man human" certainly, and obviously it cannot have been "fashioned" in the "relation of parents to children", in the sense that the languages of hunting, agriculture or ship-

in primitive societies for hundreds of thousands of years before the first civilizations made their appearance; and the first civilizations were considerably older than the first higher religions. Even the rudiments of higher religions did not appear till some of the civilizations of the first generation were already disintegrating, while the rise of fully-fledged higher religions was subsequent to the breakdown of civilizations of the second generation. Thus our series is a chronological sequence; but it is also a genealogical tree; for the primary civilizations must have been derived from the primitive societies through mutations achieved in response to challenges from the physical environment;¹ the first rudiments of higher religions were derived from the primary civilizations through their internal proletariats; the secondary civilizations were derived from the primary civilizations either through the primary civilizations' dominant minorities or through their external proletariats; the fully-fledged higher religions were derived from the secondary civilizations through their internal proletariats;² the tertiary civilizations

building imply wider social groups; but why cannot speech have *begun* within the family? Meyer seems to beg the question.

'But when you speak of Sub-Man as "achieving" the "difficult feat of turning into human beings", you imply something quite different: an evolutionary pulling-onself-up-by-one's-own-bootstraps. The reader is entitled to ask: "Did Man make himself? Or did God create him?" There can be no conflation of the two views that does not give the second an absolute logical and historical priority.'

So clear and so crucial a question required the clearest and frankest answer that the writer could give. His own belief was that there was nothing in the Universe known to Man that had made itself. All things—human and non-human, animate and inanimate—were 'creatures' in the sense that they had been brought into existence, were kept in existence, and were changed or disbanded by a divine Power and a divine Purpose that were not their own and that, though manifested in and through them, were also always and everywhere outside them and always and everywhere independent of them. At the same time the writer believed that the Creator's purpose and method was, at all stages and levels of creation, to take His creatures into partnership with Himself and to give them the utmost opportunity of sharing in His work. This seemed manifest in the Human Nature with which God had endowed His creature Man; and the writer believed that, in this respect, Man was not a 'sport' (in the naturalist's usage of the word) but was, on the contrary, a type of all creation which gave an insight into the character and aim of all God's work. On this view, both the soul in Man and the sociality of Sub-Man would be gifts given by God to a creature that had responded to a challenge from God to embrace a God-given opportunity of becoming more godlike.

As for the writer's use of the traditional language, on which Mr. Wight legitimately lays his finger, he might say, for his readers' information, that his regular and deliberate practice was to continue to employ traditional language unless and until he could find new words that seemed to him to express his meaning more clearly and more exactly. In the writer's day the resources of language were still utterly inadequate.

¹ See II. i. 302-30.

² In virtue of their all thus standing on the same line in the same genealogical table, the fully-fledged higher religions—as distinct from the rudiments of higher religions discernible in such refinements upon a primitive Nature-worship as the cult of Tammuz and Ishtar—might be regarded as being 'philosophically contemporary' with one another. When, however, the dates of their respective epiphanies were entered on a single time-chart, it proved that their common chronological 'locus' was not a single generation or even a single century, but was an aeon of the order of not less than two millennia.

This comparatively wide chronological spread of the age which had seen the higher religions make their appearance on Earth was due to several causes. In the first place the civilizations of the second generation did not all emerge at the same moment. The emergence of the Babylonian, Hittite, and Indic civilizations might be dated tentatively in the fourteenth century B.C., the emergence of the Syriac and the Hellenic in the twelfth century B.C., the emergence of the Sinic in the twelfth or in the eleventh according to our choice between the two variant versions of a traditional Sinic chronology. In the second place the durations of their growth-phases were unequal. The Syriac Civilization broke down after Solomon's death *circa* 937 B.C., the Indic perhaps at some date in the eighth century B.C., the Sinic in 634 B.C., the Hellenic in 431 B.C. In the third place the

were derived from the secondary through higher religions providing chrysalis-churches; and the internal proletariats of disintegrating tertiary civilizations had been creating the rudiments of higher religions of a new generation—rudiments, whose genesis was, at the time of writing, an accomplished fact, though their prospects were still obscure. Let us now apply to this serial order of societies, which is both chronological and genealogical, our new experimental procedure of viewing the histories of civilizations in terms of the histories of higher religions.

On this view, we shall have first of all to revise our previous tacit and uncritical assumptions about the *raison d'être* of civilizations. We shall have to think of the civilizations of the second generation as having come into existence, not in order to perform achievements of their own, and not in order to reproduce their kind in a third generation, but in order to provide an opportunity for fully-fledged higher religions to come to birth; and, since the genesis of these higher religions was a consequence of the breakdowns and disintegrations of the secondary civilizations, we must regard the closing chapters in the secondary civilizations' histories—chapters which, from their standpoint, spell failure—as being their justification for existence and their title to significance. In the same line of thought, we shall have to think of the primary civilizations as having come into existence, in their day, for the same purpose. Unlike their successors in the second generation, these pioneer civilizations failed to fulfil their *raison d'être* directly by bringing higher religions to birth. The rudimentary higher religions that their internal proletariats did create—the worship of Tammuz and Ishtar and the worship of Osiris and Isis—did not come to flower. Yet, in spite of this immediate failure, the primary civilizations accomplished their mission indirectly

disintegrations of the Syriac and the Indic civilizations were protracted by the Hellenic Civilization's forcible intrusion upon them. The disintegration of the Indic Civilization took some 1,500 years (*circa* 725 B.C.—A.D. 775) and that of the Syriac some 2,200 years (937 B.C.—*circa* A.D. 1275), as against the 1,100 years taken by the same process of disintegration in Sinic history (634 B.C.—*circa* A.D. 475) and in Hellenic history (431 B.C.—*circa* A.D. 675).

The total span of the period during which the higher religions were making their epiphanies in the internal proletariat of one or other of these four disintegrating civilizations thus ran from the tenth century B.C. to the thirteenth century of the Christian Era; and, in dating this period, which he labels 'the Axis Age' (*die Achsenzeit*), *circa* 800–200 B.C., Karl Jaspers (*Vom Ursprung und Ziel der Geschichte* (Munich 1949, Piper), p. 19) is excluding from it the epiphanies of Christianity, the Mahāyāna, Hinduism, and Islam. It would be a still greater mistake to try to confine 'the Axis Age' to the single generation (*floruit circa* 500 B.C.) of Confucius, Lao-tse, the Buddha, Deutero-Isaiah, and Pythagoras; for, while it was true that these seers were all contemporary with one another and were also all outstanding representatives of the philosophers and the prophets of the Age of the Disintegration of the Civilizations of the Second Generation, it was not true that they were all representatives of the same phase of the identical experience to which they were all responding; for a merely chronological contemporaneity does not necessarily carry with it the 'philosophic contemporaneity' which consists in living in a corresponding phase of experience and not in living at the same date. Confucius and the Buddha were, perhaps, approximately contemporary with one another in the philosophical as well as in the chronological sense, considering that the Sinic and the Indic Civilization appear to have broken down at dates that were perhaps not more than a hundred years apart. On the other hand the breakdown of the Hellenic Civilization had not yet occurred in Pythagoras' day, and the philosophic contemporaries of the Buddha and Confucius in Hellenic history were not their chronological contemporaries Pythagoras and the fathers of Orphism, but a Zeno and an Epicurus who, on a chronological time-chart, were to make their appearance some two hundred years later than their 'philosophic contemporaries' in the Sinic and the Indic World.

by giving birth to secondary civilizations out of whose breakdown and disintegration the fully-fledged higher religions did eventually arise. We were feeling our way towards this revised view of the significance of the histories of the civilizations, and towards this inverted valuation of the growth-chapters and the disintegration-chapters of the story, when we were making our survey of universal states and were discovering that these master-institutions of civilizations in decline were apt to be barren in so far as they worked for themselves and fruitful only in the service of alien beneficiaries.¹ We have now to apply this finding comprehensively to the histories of civilizations from beginning to end.

Revelation through Tribulation

On this showing, the successive rises and falls of the primary and the secondary civilizations are an example of a rhythm—observed in other contexts²—in which the successive revolutions of a wheel carry a vehicle, not on the repetitive circular course that the revolving wheel itself describes, but in a progressive movement towards a goal. And, if we ask ourselves why the descending movement in the revolution of the wheel of Civilization should be the sovereign means of carrying the chariot of Religion forward and upward, we shall find our answer in the truth that Religion is a spiritual activity, and that spiritual progress is subject to a 'law' proclaimed by Aeschylus in the two words *πάθει μάθος*, and by the author of the Epistle to the Hebrews in the verse: 'Whom the Lord loveth He chasteneth, and scourgeth every son whom He receiveth.'³

If we apply this intuition of the nature of spiritual life to a spiritual endeavour that culminated in the flowering of Christianity and her sister higher religions the Mahāyāna, Islam, and Hinduism, we may discern in the passions of Tammuz and Attis and Adonis and Osiris a foreshadowing of the Passion of Christ, and may find in Christ's Passion a crowning experience in the spiritual travail of legions of human souls in successive failures of the secular enterprise of Civilization.

Christianity itself had arisen out of spiritual travail that was a consequence of the breakdown of the Hellenic Civilization; and this was the latest chapter in a longer story; for Christianity had Jewish and Zoroastrian roots, and these roots—altruistically fertile in a stem that had been grafted on to them—had sprung from the earlier breakdown of two other civilizations of the second generation, the Babylonian and the Syriac, which had become locked together, in an embrace that was both deadly and fruitful, in the course of their simultaneous disintegration.⁴ The living waters of Zoroastrianism had flowed into the stream of Judaism—to find their way thence, in the fullness of time, into the river of Christianity⁵—within the framework of an Achaemenian Empire that had provided the Syriac World with its universal state; and Judaism

¹ See Part VI, *passim*, above.

² See IV. iv. 34–38 and V. vi. 324–5.

³ Aeschylus: *Agamemnon*, ll. 177–8, and Heb. xii. 6, quoted in I. i. 169, n. 1, and in II. i. 298. For the working of this spiritual 'law', see further p. 425, n. 4, below.

⁴ See V. v. 117–22.

⁵ The contributions of Zoroastrianism to Christianity have been touched upon in V. vi. 43–44.

and Zoroastrianism alike had been the spiritual fruit of the tribulation of a preceding Time of Troubles. The kingdoms of Israel and Judah, in which the well-springs of Judaism were to be found, had been two of the many warring parochial states of the Syriac World in its ages of growth and disintegration; and the premature and permanent overthrow of these mundane commonwealths, and extinction of all the political hopes which had been bound up with their existence as independent polities, were the experiences that had brought the religion of Judaism to birth and had evoked the highest expression of its spirit in the elegy of the Suffering Servant that had been indited in the sixth century B.C. during the last throes of a Syriac Time of Troubles, on the eve of the foundation of the Achaemenian Empire by Cyrus.¹

This was not, however, the beginning of the story of progressive spiritual experience of which Christianity was the climax;² for the Judaic root of Christianity had a Mosaic root of its own, and this pre-prophetic phase of religion in Israel and Judah had been the outcome of a previous secular catastrophe, the break-up of 'the New Empire' of Egypt.³ Whether or not there was any truth in the Israelites' tradition that, in the militantly expansive chapter of Egyptiac history following the expulsion of the Hyksos, the Hebrews had been temporarily conscripted into the Egyptiac internal proletariat, it was certain that they had filtered into the Egyptian dominions in Syria as barbarians from the North Arabian Steppe during an age in which Syria was being annexed to a disintegrating Minoan World through a mass-migration of refugees from the Aegean 'Isles of the Sea'.⁴ The Israelites themselves believed that this Egyptiac episode in their history had been preceded by a Sumeric initiation, in which Moses' forefather and forerunner Abraham had received a revelation and a promise from a divinity that was the One True God, and had been led by this divine guidance to extricate himself from the doomed imperial city of Ur, as Christian, in *The Pilgrim's Progress*, fled betimes from the City of Destruction. According to the tradition the enlightenment of Abraham was the first act in God's manifestation of Himself to a Chosen People; and the secular historical background against which this opening of a spiritual drama was set was the break-up of an 'Empire of the Four Quarters' which had been the final embodiment of a disintegrating Sumeric Civilization. Thus the first step in a spiritual progress which was to culminate in Christianity was traditionally associated with the first instance, known to historians, of the collapse of a universal state, which is the supreme catastrophe for a secular civilization.

Though a twentieth-century Western historian did not know whether 'Abraham' and 'Moses' were 'historical characters', the answer to that question was not of capital importance, since it could be taken as certain that their names stood for authentically historical stages of religious experience. The human beings who 'learnt through suffering' in the last agonies of the Sumeric and Egyptiac civilizations were precursors of Prophets of Israel and Judah who were enlightened, in their turn, by

¹ See V. vi. 120-30.

³ See V. vi. 39 and 43.

² See V. v. 119, n. 4.

⁴ See I. i. 92-94 and 100-3 and V. v. 611.

the tribulations of a Babylonian and Syriac Time of Troubles,¹ and all these men of sorrows were precursors of Christ. The successive sufferings through which they won a progressive enlightenment stood out, on a retrospective view, as Stations of the Cross in anticipation of the Crucifixion.²

In this perspective, Christianity could be seen to be the climax of a continuous upward movement of spiritual progress which had not merely survived successive secular catastrophes but had drawn from them its cumulative inspiration. To judge by this momentous historical instance, the circumstances favourable to spiritual and to secular progress are not only different but are antithetical;³ and this 'law'—if we have stumbled here upon a 'law' governing the relations between mundane life and Religion—is not a paradox.⁴ Spiritual and secular ideals are at variance; they are perpetually striving with one another for mastery over human souls; and it is therefore not surprising that souls should be deaf to the call of the Spirit in times of secular prosperity, and sensitive to the neglected whisper of the still small voice⁵ when the vanity of This World is brought home to them by secular catastrophes and when their hearts are softened by the sufferings and sorrows that these catastrophes inflict. When the house that Man has built for himself falls in ruin about his ears and he finds himself standing again in the open at the mercy of the elements, he also finds himself standing again face to face with a God whose perpetual presence is now no longer hidden from Man's eyes by prison walls of Man's own making. If this is the truth, the interregna which punctuate secular history by intervening between the submergence of one civilization and the emergence of a successor may be expected to have, as their counterparts in religious history, not breaches of continuity or pauses in the pulsation of life, but flashes of intense spiritual illumination and bursts of fervent spiritual activity.⁶

The Higher Religions' Consensus and Dissension

On this reading, the history of Religion appears to be unitary and progressive by contrast with the multiplicity and repetitiveness of the

¹ 'The example of Judaism shows that a political catastrophe can actually give a mighty impetus to religious development' (Meyer, E.: *Geschichte des Altertums*, 4th ed., vol. i, Part I (Stuttgart and Berlin 1921, Cotta), p. 156).

² See Luke xvi. 16; Acts x. 43 and xxvi. 22; Heb. i. 1-2.

³ On this question see, further, pp. 701-15, below.

⁴ 'Perhaps there lies an historical law here, still incompletely revealed to us, which transcends even the might of Rome and of Christianity. Augustine may have had an intimation of it; for, having said that God brought the great empire into being in order that His revelation might be the more easily comprehended and diffused, he might logically have added that God was now bringing about its dissolution in order that Man, confronted by the contrast between his aspirations and his achievements, might the more fully perceive that inner must precede outer reformation' (Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), p. 148).

⁵ 1 Kings xix. 12.

⁶ 'Times of transition, in which the old order is breaking up and new rules of life are taking shape—times in which nothing remains secure—are the very times in which the religious life displays the most intense activity. . . . [The personalities of religious reformers] make their appearance in the greatest numbers and do their work with the greatest effect in times of ferment, in which the life has gone out of the old order and

histories of civilizations; and this contrast in the Time-dimension presents itself in the Space-dimension as well; for Christianity and the other higher religions that, in the twentieth century of the Christian Era, were living side by side, in an *Oikoumenê* which had recently become coextensive with the whole habitable and traversable surface of the planet, had a closer affinity among themselves than coeval civilizations had been apt to have with one another.¹

This affinity was conspicuously close as between Christianity and the Mahāyāna, which shared the same vision of God² as a self-sacrificing saviour, and owed this penetrating common insight into God's nature to a common Syriac inspiration within a common Hellenic framework. While, in an Hellenic universal state provided by the Roman Empire, a proletarian religion sprung from Judaism was being translated into terms of Greek philosophy, the inverse process of converting an Indic philosophy into a proletarian religion was being carried out, at the opposite extremity of a Hellenizing World, in the Kushan successor-state of Bactrian Greek empire-builders who had 'abolished the Hindu Kush';³ and the uniform influence of these convergent experiences on the two religions was manifest eighteen hundred years later. As for Islam and Hinduism, we have noticed in other contexts that they had allowed themselves to be used for the compromising secular purpose of expelling an intrusive

new ideas are seeking to break through' (Meyer, E.: *Geschichte des Altertums*, 4th ed., vol. 1, Part I (Stuttgart and Berlin 1921, Cotta), pp. 126-7 and 151).

This would appear to be the answer to a question which had been raised by Karl Jaspers in *Vom Ursprung und Ziel der Geschichte* (Munich 1949, Piper), pp. 19-42: 'Erster Teil, 1. Die Achsenzeit': Why was it that like-minded philosophies and, at their heels, like-hearted higher religions had made simultaneous epiphanies at three points in the *Oikoumenê*—in the Sinic World, the Indic World, and the Syriac and Hellenic worlds according to the terminology used in the present Study—independently of one another (p. 33)? After rightly rejecting, as inadequate, the suggestion that a new *Weltanschauung* was propagated by commercial intercourse (p. 39), or that it was an identical reaction to the identical experience of antecedent Eurasian Nomad invasions (pp. 37-38), Jaspers points out that each of these epiphanies occurred in a society that was articulated politically into a host of warring parochial states (pp. 23 and 39), and that 'what had begun by being freedom of movement turned in the end into anarchy' (p. 24). An identical spiritual response to the challenge of this identical tragic social experience would be the explanation of the identity of mind and heart in philosophies and religions which made their appearance simultaneously in several societies that were still insulated from one another at the time. This common tragic experience of the failure of a secular civilization would account for the common *êthos* which Jaspers portrays with a masterly touch.

'The new feature of the Axis Age, which displays itself in all three worlds alike, is that Man becomes conscious of the Universe, of himself, and of his own limitations. He realises the awfulness of the World and his own impotence. He asks himself radical questions. Finding himself on the edge of the abyss, he strives for liberation and redemption. While he consciously comprehends his limitations, he sets himself the highest goals. He becomes aware of the Absolute both in the depths of his selfhood and in the clarity of the Transcendent' (p. 20).

¹ The points of likeness and difference between the four higher religions that were alive in this age are examined further, on pp. 716-36, below.

² In theory a bodhisattva was, not a god, but a spiritual athlete who had arrived at the brink of *Nirvāna* where it was within his power at any moment to escape from the sorrowful wheel of existence, of which the motive-power is *libido* and the momentum is *karma*. In an inverted Christian terminology the bodhisattva could be described as a bondsman of immortal life who had won, but had generously forborne to exercise, the right to put on mortality and so to bring to pass the saying that is written: 'Life is swallowed up in victory' (1 Cor. xv. 53-54). In practice, however, the Mahayanian bodhisattvas were worshipped by their devotees as very gods. (See V. vi. 148 and 164, n. 3, and pp. 482-3, below.)

³ See V. v. 139-40, and pp. 471 and 478, below.

Hellenism from the Syriac and from the Indic World respectively; but this was not the last word that remained to be said about them; for, notwithstanding this mundane role of theirs in an encounter between civilizations, they too reflected insights into the nature of God which gave them a distinctive meaning and mission of their own on the spiritual plane. Islam was a reaffirmation of the unity of God against an apparent weakening in Christianity's hold on a vitally important truth which had been won for Mankind by Judaism; Hinduism re-affirmed the personality of God—at any rate on the plane of reality on which God reveals Himself as an object of devotion for a human worshipper—against an apparent denial of the existence of personality in the Primitive Buddhist system of philosophy.¹ An exponent of the Mahāyāna might protest that this denial was no part either of Siddhārtha Gautama's original teaching or of latter-day Mahayanian practice, and an exponent of Christianity might protest that the Christian doctrine of the Trinity was an enunciation of the sociality of God which left the recognition of God's unity intact. Yet, in maintaining that a synthesis of all the essential truths about God was to be found in his own religion, neither the Christian nor the Buddhist would deny that the Muslim and the Hindu were alertly alive to certain aspects of the truth—even if they might appear, in Christian and Mahayanian eyes, to be blind to others.

After agreeing with the follower of the Mahāyāna in this verdict on the rival claims of the Muslim and the Hindu, a Christian might go on to maintain that there was one aspect of the truth that was revealed in Christianity alone.² While Islam, Hinduism, and the Mahāyāna shared with Christianity the vision of God as Man's lord, and the Mahāyāna shared with her the vision of Him as Man's saviour, Christianity was unique (so the Christian might contend) in revealing God to Man as Man's father and brother.³

¹ See V. v. 134-8.

² Cassian, the Christian spiritual pioneer who, after the turn of the fourth and fifth centuries of the Christian Era, migrated from his birthplace at the eastern extremity of the Latin-speaking world in the Dobruja (see IV. iv. 326, n. 2) to the western extremity of the Greek-speaking world at Marseilles in order to sow seeds of Egyptian monasticism in the soil of a Gaul that was being relieved of the economic incubus of the Roman Imperial régime at the price of becoming the political prey of barbarian conquerors, depicted the aspiring Christian soul's way of ascent towards the *Visio Beatifica* as a spiritual ladder; and the lower rungs, as described by him, can be identified with the ideals of non-Christian religions that, in the previous generation, had been Christianity's rivals for the captivation of Hellenic souls. 'This ladder roughly reproduces that chronological way by which Augustine climbed: the lower third, with its repudiation of matter and the flesh, is Manichaeism; the middle third, with its hope that, through virtuous living and a concentration on the supersensuous, Man can resume his spiritual nature, is Neoplatonic; the last third, with its indifference to both matter and spirit, provided the joy comes of loving a God whose might is only equalled by His mercy, is Christian. It is this love and joy that is the gift of grace' (Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), p. 476).

³ In this divination of the presence of 'a friend behind the phenomena', Christianity had been anticipated by the Stoic school of Hellenic philosophy, but the Stoic's intellectual apprehension of this amazing truth about the relation between God and Man had not the same power as the Christian revelation to move men's hearts. 'Man finds God in helping his neighbour' (*Deus est mortali iuvare mortalem*) has the same meaning as 'God is Love', but the philosopher's prose lacks the fire of the Evangelist's poetry. For this Stoic intuition of the nature of God, see Murray, Gilbert: 'The Stoic Philosophy', in *Essays and Addresses* (London 1921, Allen & Unwin), pp. 99 and 103-4. 'A friend behind the phenomena' is a phrase of Edwyn Bevan's. 'Man's true God is the helping of Man' is quoted from an unnamed Stoic source by Pliny: *Naturalis Historia*, Book II, chap. 7 (5), §18.

So the All-Great were the All-Loving too—
 So through the thunder comes a human voice
 Saying: 'O heart I made, a heart beats here!
 'Face, my hands fashioned, see it in myself!
 'Thou hast no power nor mayst conceive of mine,
 'But love I gave thee, with myself to love,
 'And thou must love me who have died for thee.'¹

This claim that Christianity made to pre-eminence over her sister religions (a claim that was, of course, echoed in counter-claims of theirs) was a crux for an historian brought up in a Christian tradition.

The personal *tour de force* which an historian has to attempt if he is to perform his professional service for his fellow human beings is to correct, by imagination, the bias inherent in the standpoint at which he has been placed by the historical accidents of his birth and upbringing, in order to see and present the flux of human life *sub specie aeternitatis*. But human attempts to see human affairs through God's eyes must always fall infinitely short of success; and, while it is difficult enough for the historian to correct his political bias as a citizen of a state and his cultural bias as a member of a society, the hardest of all the feats of imagination that are required of him is to see beyond the *Weltanschauung* of an ancestral higher religion. If he turns savage against it and tries to break out of its confines by force, the faith of his fathers revenges itself upon him by becoming a veritable prison-house whose magic walls pen the ex-Christian atheist and the still Christian believer together in a common mental captivity which is palpable to a non-Christian looker-on. With this warning to himself and his readers, the writer of this Study will venture to express his personal belief that the four higher religions that were alive in the age in which he was living were four variations on a single theme, and that, if all the four components of this heavenly music of the spheres could be audible on Earth simultaneously, and with equal clarity, to one pair of human ears, the happy hearer would find himself listening, not to a discord, but to a harmony.²

¹ Browning, Robert: *An Epistle containing the Strange Medical Experience of Karshish, the Arab Physician*.

² A searching Christian criticism, not only of this passage, but of the whole of this Part of the present Study, by Mr. Martin Wight has been printed, with its author's consent, as an annex to this chapter on pp. 737-48, below. In the present writer's belief, Mr. Wight's exposition of the historic Christian standpoint regarding the relation between Christianity and the other higher religions was not merely correct; it also appeared to him to go to the heart of the matter; and the writer therefore agreed with Mr. Wight's conclusion that his 'solution of the problem of the relationship between Christianity and the higher religions fails to be in Christian terms' if the interpretation of the word 'Christian' was to be confined, as the Christian Church was, no doubt, historically and juridically entitled to confine it, to the sense in which the word had been used in the Church's own authoritative statements of its position. If the writer were to be asked: 'Do you believe or disbelieve that Christianity or any other higher religion is an exclusive and definitive revelation of Spiritual Truth?' his answer would be: 'I do not believe this. I believe that any such claim is an error which is at the same time a sin. In claiming to possess a monopoly of the Divine Light, a church seems to me to be guilty of hybris. In denying that other religions may be God's chosen and sufficient channels for revealing Himself to some human souls, it seems to me to be guilty of blasphemy. If it is inadmissible to call oneself a Christian without holding these tenets, then I am not entitled to call myself a Christian; I must call myself a Symmachan (see p. 442, below). Symmachus's confession of faith—"The heart of so great a mystery can never be reached

This belief is declared—in terms that, no doubt, betray the inevitable bias and limitations of an hereditary Christian standpoint—in a passage from the pen of a leader of Christian thought and action in the generation of the wars of 1914 and 1939 whose untimely death had been a grievous loss to his contemporaries.

‘All that is noble in the non-Christian systems of thought or conduct or worship is the work of Christ upon them and within them. By the Word of God—that is to say, by Jesus Christ—Isaiah and Plato and Zoroaster and [the] Buddha and Confucius conceived and uttered such truths as they declared. There is only one divine light; and every man in his measure is enlightened by it. Yet . . . each has only a few rays of that light, which needs all the wisdom of all the human traditions to manifest the entire compass of its spectrum.’¹

A Muslim, Buddhist, or Hindu who found this Christian formulation unacceptable would confess to the same belief in terms of his own faith if he had reached the same degree of insight as the writer of those words. A Buddhist or a Hindu mystic would report that his Christian or Muslim fellow spiritual pioneer, who had likewise pierced the barriers of time and place and historical accident, had been driven by a still unextinguished demon of Desire into trying to push on beyond the goal of *Nirvāna* in which the Indic pilgrim had entered into his rest, while the Muslim or the Christian pilgrim would report that his Hindu and Buddhist fellow travellers had mistaken a spiritual station for a spiritual terminus. Yet both parties of explorers would bring back to their fellow men an identical report of the first stage, at least, of their journey.²

Dare we discern in this partial consensus of the elect the glimmer of a dawn, heralding a spiritual sunrise? ‘The elders obtained a good report’³ by faith. But such faith—which ‘is the substance of things hoped for, the evidence of things not seen’⁴—would be ill-inspired if it were to tempt a student of History in the writer’s generation to evade a question that was raised—and this immediately and insistently—by any sanguine forecast of the spiritual future of Mankind on Earth. Why was it that, at least in the Judaistic churches,⁵ Man’s glimpse of the unity of revelation

by following one road only”—is an article in my creed which neither my head nor my heart will allow me to abandon.’

As the writer saw it, Symmachus’s challenge to Ambrose was still awaiting its answer after the passage of more than fifteen and a half centuries. The repressive use of physical force, which had been a Christian Roman Imperial Government’s retort to Symmachus, had, of course, been no answer at all.

¹ Temple, William: *Readings in Saint John’s Gospel*: First Series, chaps i–xii (London 1939, Macmillan), p. 10.

² See V. vi. 171–2, where it has been argued that *Nirvāna* lies on the same road that leads on to the *Civitas Dei*, and V. vi. 143, n. 3, where the reader’s attention has been drawn to the difference between an Hellenic-Indic and a Christian-Islamic kind of mystical experience. This difference is underlined by Mr. Martin Wight in a comment on the original draft of the present passage:

‘There seem to be two kinds of mystic, one of whom attains the annihilation of personality, the other the fulfilment of personality in the Vision of God. They have nothing in common except that both, from the ordinary man’s point of view on the plain, are well above the snow-line. The first kind, in Christian eyes, is pantheistic and heretical, e.g. Eckhart; the second kind is illustrated by Saint John of the Cross. Cp. below, p. 720.’

³ Heb. xi. 2.

⁴ Heb. xi. 1.

⁵ ‘Surely it is a characteristic difference between Hinduism and the religions of the Judaic tradition that Hinduism does *not* make this exclusive claim. Cp. V. vi. 47–48. “Hinduism”, says Radhakrishnan, “seeks the unity of religion not in a common creed

had been confined, hitherto, to a few rare spirits, whereas the ordinary outlook had, unhappily, been the opposite? In the official view of each of the Judaistic higher religions the light that shone through its own private window was the only full light, and all its sister religions were sitting in twilight, if not in darkness; the same standpoint was maintained by each sect of each religion against all its sister sects; and this uniform refusal of diverse denominations and churches to recognize what they had in common and to admit one another's claims gave occasion for the agnostic to blaspheme.

'These professedly higher religions', the agnostic could point out, 'all claim to be complete and final revelations of spiritual truth and prescriptions for the right conduct of life. They all bring forward the same considerations in support of their claims; and, whatever one may think of their arguments, their consensus is so impressive that the most sceptical mind might feel some trepidation at the prospect of having to enter into a disputation with such a troop of advocates of a common thesis. Fortunately, though, for the poor agnostic, the angelic doctors have exempted him from this intellectual ordeal. Withough waiting for their common adversary to put the Devil's case, they have each done the Devil's work for him by repudiating the claims of their brethren. In their animus against one another they have never (*mirabile dictu*) paused to consider that, in refusing recognition to one another's claims, they are each cutting the ground from under his own feet. The truth is that their pretensions are identical; and so they stand or fall together. In electing to fall by their own act, they have stripped themselves of their disguise and exposed themselves in their true colours.

'In their self-inflicted nakedness, they have revealed themselves as being primitive tribal religions, which are exceptional in nothing but the magnitude of their spiritual pretensions and of their geographical domains. Whereas the worship of an Athena Poliûchus or a Fortuna Praenestina had a range of no more than a few miles' radius from the local shrine of the tribal goddess, Christianity and Islam and Hinduism and the Mahâyâna can boast of hundreds of millions of adherents occupying whole continents and overflowing to the opposite shores of oceans. Yet, huge though these latter-day ecclesiastical empires are, they too are still parochial.

'Their parochial patriotism is betrayed in their institutions and in their rites. Is not tribalism inherent in the very notion of a "holy land" or a pilgrimage-resort?¹ How can the presence of a hypothetically infinite

but in a common quest' (*The Hindu View of Life* (London 1927, Allen & Unwin), p. 58). Is the Mahâyâna equally non-exclusive? (cp. below, pp. 438-9).—Martin Wight.

Sir Charles Eliot, in his *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), points out that, 'more than any other religion, [Hinduism] is a quest of truth and not a creed which must necessarily become antiquated' (vol. i, p. xci). This passage also has a bearing on the argument on pp. 438-9, below.

¹ 'The agnostic here runs the risk of misrepresenting his opponents. It is true that the practice of pilgrimage can sink to the superstitious level of supposing that God "makes Himself felt more palpably" in the holy place than elsewhere, but its original and uncorrupted purpose is to acquire merit by making an act of devotion or expiation.'—Martin Wight.

'Catholic pilgrimages are made, not because God is more here than there, but because people—being what human beings are—associate places with deeds and so stir them-

and eternal God be supposed to make itself felt more palpably in Palestine than in Alberta, or in the Hijāz than in Eastern Bengal? Is not this geographical fantasy of the Scribes and Pharisees confuted by the spiritual vision of a poet whose inward eye can see Jacob's ladder pitched between Heaven and Charing Cross, and Christ walking on the water, not of Gennesareth, but of Thames? Is not this poet a true seer in divining that God dwells in no strange land? And what doth it profit a man to make the pilgrimage to Rome or Jerusalem, Mecca or Karbalā, Benares or Bodh Gaya? Is the pilgrim exempt from the psychological law that "caelum, non animum, mutant qui trans mare currunt"?¹ Has not the truth about the virtue of going on pilgrimage been told by Tolstoy in his Tale of *Two Old Men*? Does not God's true servant do God's will if he tarries to play the Good Samaritan in an Ukrainian village better than if he ruthlessly shuts his ears to a human cry of distress and pushes on to witness the magic rekindling of the sacred fire in the Church of the Holy Sepulchre? And what about the provincialism of "the higher religions'" rituals? Does not Christianity proclaim itself to be, not a religion for all Mankind, but merely a local Mediterranean cult, when it insists that its crucial sacrament is only efficacious if it is celebrated with bread and wine? On this point of ritual practice there is a rigid conformity between the divers Christian denominations that wrangle with one another over the nature and the significance of the rite. How can a sacrament that is thus indissolubly associated with the regional diet of *Homo Mediterraneus* be expected to serve as a means of grace for the rice-eating majority of Mankind, in continents where the vine does not grow, and in archipelagos that know no name for bread?²

'The truth is that these would-be world religions are serfs of tribalism, *ascriptae glebae*. The vast majority of their supporters adhere to them for the same primitive reason for which the Athenians adhered to Athena Poliûchus and the Praenestines to Fortuna Praenestina—not because the worshipper has been personally convinced, after a searching and impartial scrutiny of all the alternative religions, that this particular religion is true and right, but because this particular religion happens to be prevalent, short of being officially "established", in the place at which the worshipper happens to have been born, at the date at which his birth happens to have taken place. "Fato Metelli Romae consules fiunt."³

'You, Thomas,' our agnostic might point out *ad hominem*, 'are a Christian of the Orthodox Faith because you happen to have been born at Damascus in the fourth century of the Christian Era; if you had been born there a hundred years later, you would certainly still have been a

selves to greater fervour. Saint Thomas More was as much against an excess in the practice of pilgrimage as Tolstoy was. I do not think your remarks just at this point.'—Comment by a Catholic friend of the writer's.

¹ Horace: *Epistulae*, Book I, Ep. xi, l. 27.

² The writer of this Study vividly remembers how forcibly his own provincialism was borne in upon him when—landing in Japan in the autumn of A.D. 1929, and making his way up country from Nara to Koya San, the Mahayanian Olympus—he found himself compelled to ask for an unobtainable form of food in Portuguese, because, in the Japanese language, there was no indigenous word for 'bread'.

³ Naevius, C.: *Bellum Pœnicum*.

Christian, but probably a Monophysite—while a birthday a hundred years later still in the same birthplace might have changed your faith to Islam and your name to Ahmad. If you are thus born a Muslim at Damascus in the second century of the *Hijrah* you will find yourself a Sunnī; but get yourself born eight hundred years later at Tabriz—or, indeed, no more than three hundred years later, no farther afield than the Lebanon—and you will find yourself an Imāmī Shī'ī. Get yourself born at Amsterdam in A.D. 1500 and you will find yourself a Roman Catholic; wait to be born in the same Dutch city in A.D. 1600 and you will turn out to be a Protestant; but, if the stork who is delivering you to your parents slightly mistakes his direction and deposits you on the right date at the wrong address, you will be born in A.D. 1600 a Roman Catholic still if he has landed you at Antwerp, but a Tantric Mahayanian Buddhist if the bird has gone so far astray as to make Lhasa your birthplace.¹ In fact, as certain also of your own apologists have said (if you will pardon my paraphrase of a celebrated passage in one of your own scriptures):² “Un méridien décide de la vérité.”³

¹ The geographical distribution of the conflicting views on the controversial issue of Predestination versus Free Will in the west of the Roman Empire during the first half of the fifth century of the Christian Era is a striking illustration of an apparent pre-determination of theological tenets by the theologically irrelevant accident of the theologian's domicile.

² Very securely, one may move north from [Africa and] Manichæan and Augustinian fatalism to Italy and prevent grace, to Gaul and grace for merit, to Britain and merit without grace. Was the cause racial instinct, intellectual disposition, maturity of civilisation, climate or mere chance? We do not know' (Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), p. 442).

³ Acts xvii. 28.

³ 'On ne voit rien de juste ou d'injuste qui ne change de qualité en changeant de climat. Trois degrés d'élévation du pôle renversent toute la jurisprudence, un méridien décide de la vérité; en peu d'années de possession, les lois fondamentales changent; le droit a ses époques, l'entrée de Saturne au Lion nous marque l'origine d'un tel crime. Plaisante justice qu'une rivière borne! Vérité au delà des Pyrénées, erreur au delà' (Pascal, Blaise: *Pensées*, No. 294 in Léon Brunschvicg's arrangement).

The institution which, in this famous passage, Pascal is discrediting by making an exposure of its geographical relativity is, of course, not Religion, but Law. The same critique can, however, be directed with the same devastating effect against Theology, as indeed it has been directed in other contexts by Pascal himself:

'Pour le choix de la condition et de la patrie, le sort nous le donne. C'est une chose pitoyable de voir tant de Turcs, d'hérétiques, d'infidèles, suivre le train de leurs pères, par cette seule raison qu'ils ont été prévenus chacun que c'est le meilleur' (No. 98).

'On a beau dire, il faut avouer que la religion chrétienne a quelque chose d'étonnant. "C'est parce que vous y êtes né", dira-t-on. Tant s'en faut; je me raidis contre, pour cette raison-là même, de peur que cette prévention ne me suborne. Mais, quoique j'y sois né, je ne laisse pas de le trouver ainsi' (No. 615).

There is an admirable candour and sincerity in this last passage, in which the critic is applying his critique of the geographical relativity of human institutions to his own ancestral faith. An agnostic John Stuart Mill did not have to exercise the same high virtues in making the same point:

'The World, to each individual, means the part of it with which he comes in contact: his party, his sect, his church, his class of society; the man may be called, by comparison, almost liberal and large-minded to whom it means anything so comprehensive as his own country or his own age. Nor is his faith in this collective authority at all shaken by his being aware that other ages, countries, sects, churches, classes and parties have thought, and even now think, the exact reverse. He devolves upon his own world the responsibility of being in the right against the dissentient world of other people; and it never troubles him that mere accident has decided which of these numerous worlds is the object of his reliance, and that the same causes which make him a Churchman in London would have made him a Buddhist or a Confucian in Peking' (Mill, J. S.: *On Liberty*, chap. 2 (p. 80 in the Everyman edition)). The writer's attention was drawn to this passage by Mr. Martin Wight.

The Causes of the Dissension and the Prospects of Transcending it

The words that we have put into the mouth of our imaginary *advocatus diaboli* were true to fact, and the facts were surprising, because it was also true that this provincialism, of which the higher religions stood convicted in practice, was the antithesis of the revelation which was their common essence. The higher religions had revealed a new insight into the nature of God which carried with it, as its necessary corollary, a new view of the relations of human beings with one another. If God is One, He cannot be either Athena Poliûchus or Fortuna Praenestina or any other of the innumerable local godlets who had been these two city-goddesses' neighbours and rivals; and He must have 'made of one blood all nations of men for to dwell on all the face of the Earth'.¹ If God is Love, he cannot be 'a man of war',² and the Psalmist errs and sins in singing 'blessed be the Lord my strength which teacheth my hands to war and my fingers to fight'.³ If God is not contained in any of His creatures, then Man's corporate self-worship of himself is idolatry, even if this worship is paid, not to a parochial and militant Athena Poliûchus, but to an oecumenical and pacificatory Dea Roma. Moreover, the higher religions did not merely stand for these truths; they had put them into action. Their entry into the World had been an epiphany of God and at the same time a liberation of Man. It had freed Man from his previous bondage to his own corporate self.⁴ In the spiritual power of the higher religions, Man had been able to overcome the political barriers between parochial states and even the cultural barriers between parochial civilizations.⁵ How had the churches come to reimpose on their adherents the very bonds from which they had once set them free?

One answer to this perplexing question was perhaps to be found in the fact that the higher religions' ability to convert souls had been limited by Man's inability to learn except through suffering, so that the missionary's labour of love had had to wait upon the conqueror's work of destruction. In doing the Devil's work for the ephemeral aggrandisement of his fatherland and the trivial satisfaction of his own petty personal ambition, the conqueror is doing God's work without either willing or knowing it;⁶ for, in destroying the political liberty of his corporate victims the deified parochial states, he is unintentionally and unconsciously bringing religious liberty to souls that, in the days of their own country's perversely lamented sovereign independence, were fast bound in the misery and iron⁷ of spiritual servitude to a religion of corporate self-worship. When the conqueror strikes down a deified parochial state, his stroke does not simply enlarge the scale of social life by incorporating a statelet into an empire; it simultaneously transmutes the

¹ Acts xvii. 26.² As Moses chants in Exod. xv. 3.³ Ps. cxliv. 1.⁴ On this point see Meyer, E.: *Geschichte des Altertums*, 4th ed., vol. i, Part I (Stuttgart and Berlin 1921, Cotta), pp. 155-6.⁵ See V. v. 527-68, *passim*, and V. vi. 1-49, *passim*.⁶'Nun gut, wer bist du denn?'—'Ein Teil von jener Kraft
'Die stets das Böse will und stets das Gute schafft.'Goethe: *Faust*, II. 1335-6, quoted in II. i. 282.⁷ Ps. cvii. 10.

structure of social life by splitting the primitive social atom and accomplishing, in this blind act of social alchemy, that momentous separation of the Church from the State which gives individual souls their opportunity to 'seek the Lord if haply they might feel after Him and find Him'.¹

When the parochial state has been liquidated by the force of a conqueror's arms, its former citizens are converted on the political plane into subjects of the empire that this conqueror is building; but they are not thereby converted automatically into worshippers of the imperial gods. Superstition or policy or a subtle combination of the two considerations usually deters the victorious war-lord from giving this further turn to his screw. In consequence, the subjects of a parvenu oecumenical régime are apt to find themselves free to follow any religion that they may choose; and, while some of them will now voluntarily abandon the worship of hereditary parochial divinities who have disconcertingly proved to lack either the inclination or the strength to preserve their former temporal power inviolate against the gods and men of the victorious empire,² it is rare for these sheep without a spiritual shepherd to take their religious cue from the turn of political events by voluntarily transferring their ecclesiastical allegiance to the high god of the Imperial Power that has robbed the former parochial states of their political liberty.³ When, for example, Rome conferred freedom of religious choice on Spartan and Athenian souls by converting them from citizen-devotees of a deified Sparta and Athens into Rome's political subjects, their liberated hearts were captivated, not by Divus Caesar or by Dea Roma, but by Cybele, Isis, Mithras, and Christ.

This religious and ecclesiastical effect of a military and political cause was divined by Deutero-Isaiah at a turning-point in history⁴ when Cyrus was setting himself to build into an Achaemenian Empire the political debris of Syriac and Babylonian parochial states which had been previously broken in pieces⁵ by an Assyrian battering-ram. The Judæan prophet was correctly interpreting the political empire-builder's unconscious religious mission in 'the voice of him that crieth in the wilderness: Prepare ye the way of the Lord; make straight in the desert a highway for our God.'⁶ An access to the hearts of Mankind was indeed being opened for Judaism by the flying columns of Cyrus's army that were sweeping up Judah's destroyer, the Neo-Babylonian Empire, into the net of an Achaemenian universal state which was to dwarf, not only this Babylonian successor-state of the Assyrians, but the Assyrian Power itself at its short-lived apogee. Yet the Achaemenian Empire, like every other 'universal state' up to date, had been 'universal' in the psychological sense of being oecumenical-minded without also being universal in the literal sense of having actually inherited the Earth;⁷ for hitherto the military conquerors' salutary achievement of breaking down

¹ Acts xvii. 27.

² See the illuminating passage quoted from Eduard Meyer in V. vi. 30, ll. 15-17, and the references *ibid.* (vol. vi, p. 33, n. 1) to two other passages in which the same author recurs to this theme.

⁷ Matt. v. 5.

barriers, far though it had gone if measured by the extreme degree of the previous disunity of Mankind, had never been literally world-wide. During the five or six thousand years that had seen the rises and falls, up to date, of the species of society that we have labelled 'civilizations', even the most devastatingly successful of the would-be world conquerors had fallen ludicrously short of their vainglorious aim. Alexander's Macedonians had refused to cross the Hyphasis and had never seen the Tiber;¹ and the Mongols, who had once marched simultaneously on China and Hungary from opposite gates of the Khāqān's camp, had gained no foothold in India or in Western Christendom and had been repulsed with ignominy from the thresholds of Egypt² and Japan.³

Against this historical background there might be some significance in one feature of a Modern Western secular civilization which was historically unprecedented, though intrinsically superficial. While other civilizations too had burst their bounds and had incorporated into their own body social the domains of neighbouring societies either entire or in part, the Western Civilization had been unique in establishing for itself a literally world-wide dominion. At the turn of the fifteenth and sixteenth centuries of the Christian Era a society which, till then, had been leading an obscure and undistinguished existence in Ultima Thule, at the extreme north-western corner of the habitable zone of the Old World, had suddenly and surprisingly launched out upon the oceans⁴ and taken in the rear its Orthodox Christian and its Arabic and Iranic Muslim rivals—who had been pressing hard upon Western Christendom overland since the failure of her medieval attempt to expand at their expense across the Mediterranean in 'the Crusades'.⁵

In the course of the four and a half centuries that had passed since the launching of the Western oceanic voyages of discovery down to the time of writing, a post-da Gaman Western Civilization had become as world-wide as the high seas in which it had found its medium of expansion. Along these ubiquitous oceanic waterways it had propagated itself over the entire traversable and habitable surface of the globe, and had drawn into its net all other surviving civilizations as well as all surviving primitive societies. The social and psychological phenomena arising from these encounters between the Western Society and its contemporaries were not, of course, new departures.⁶ They could all be illustrated from the histories of previous encounters of the kind, in which the operations had been on a less than world-wide scale—such, for example, as the impact of the Hellenic Civilization on the Syriac, Egyptian, Babylonian, Hittite, Indic, and Sinic civilizations in the chapter of Hellenic history that had been opened by the conquests of Alexander

¹ This unfulfilled possibility of Hellenic history has been discussed by Livy in a famous passage (Book IX, chap. 16, *ad fin.*, to chap. 19, inclusive). Cp. Tarn, W. W.: *Alexander the Great* (Cambridge 1948, University Press, 2 vols.), vol. ii, pp. 396–7.

⁶ These phenomena are examined in Part IX, *passim*.

the Great. Such older illustrations were, indeed, more illuminating than the Modern Western instance for a twentieth-century Western historian, since in the earlier cases the end as well as the beginning of the story was already known. The unique feature in the Modern Western case was the prospect that, in a World which had now been brought together on a literally world-wide scale within a Western social framework, the familiar social and economic consequences of unification might make themselves felt in the relations between the living higher religions.

In the histories of other civilizations, as we have seen,¹ the process of unification had translated itself, sooner or later, into a political form; the resultant universal states had developed a high degree of 'conductivity'; and the higher religions had been the principal beneficiaries of this characteristic property of their political hosts. One of the fateful questions that were exercising Western minds in A.D. 1952 was whether, in a Westernizing World, History was going to repeat itself in this respect. This question concerning the prospects of the Western Civilization is examined in a later part of this Study;² and the considerations there submitted need not be anticipated at this point except in so far as to say that, at this date, political unification seemed likely to be the destiny of the Western Society, too, in the near future—without its being possible to forecast whether an identical and perhaps inevitable goal would be reached along the familiar road of internecine fratricidal warfare, culminating in a 'knock-out blow', or by the unprecedented method of co-operation on a constitutional basis inaugurated by peaceful agreement. On either alternative the spiritual atmosphere of a politically unified world would be likely to have much the same effect on higher religions exposed to it.

In cases in which—on a less than world-wide scale, and by the barbarous method of military conquest—the citizens of a throng of parochial states and the children of a number of different civilizations had been brought into political union, the effect on the religious plane had been, as we have observed, to transfer Religion from the field of automatic social heritage to the field of free personal choice. In the language of Natural History, this change in the social environment had given Religion the opportunity to achieve a spiritual mutation which had lifted it, so to speak, out of the Vegetable into the Animal Kingdom. Whereas Primitive Religion had been rooted in the soil of some parochially earth-bound tribe, the higher religions were volatile. As the Roman poet Ennius could look forward to living, after his own physical death, on the lips of every Latin-speaker that recited his poetry,³ so the higher religions could live in every human heart that opened itself to their revelation; and, conversely, for the Soul, Religion could cease to be an accident of birth and become a matter of choice—the most momentous choice that life in This World could present.

¹ In Part VI, *passim*.

² In Part XII. D, *passim*, in vol. ix, pp. 473-560.

³ Nemo me lacrumis decoret, nec funera fletu Faxit. Cur? Volito vivu' per ora virum.

Were similar circumstances likely to produce similar effects in the world-wide society which the Western Civilization had been bringing into being during the most recent chapter of its history? Some effects of the kind were already discernible, for the higher religions had not waited for the political unification of the World, but had started on their missionary journeys again in the wake of the Modern Western pioneer mariners. Saint Paul, who had once sailed two-thirds of the length of the Mediterranean from Caesarea to Puteoli, had taken ship again fifteen hundred years later from an Andalusian port to fulfil a prophecy of his Cordovan contemporary Seneca¹ by crossing the Atlantic and winning a New World for Caesar's pontifical heir at Rome; and in an age in which the caravel had been superseded by the steamship and the aeroplane it could be foreseen² that the other higher religions would emulate the example, set by Irish and Syrian Christian missionaries in the sixth century and by Roman Catholic Christian missionaries in the sixteenth century of the Christian Era, of going into all the World and preaching the Gospel to every creature.³

What would be the outcome of a new outburst of simultaneous missionary activities in a single field—this time, on a world-wide range? The histories of the corresponding activities within the less than world-wide frameworks of the Achaemenian, Roman, Kushan, Han, and Gupta empires (to cite only the most conspicuous of the earlier oecumenical mission fields) showed that the outcome might be either of two alternatives. The plurality of higher religions and philosophies might either be reduced to unity by the victory of one of them over all its competitors, as had happened in the Hellenic and Syriac worlds, or alternatively the competing religions might reconcile themselves to living and letting live side by side, as had happened in the Sinic and Indic worlds. The two denouements were not quite so different as would appear on the surface; for, in the cases in which the competition had gone on to the bitter end, the victorious religions had found themselves constrained to purchase their victory at the price of adopting from their discomfited rivals all elements—important or trivial, good or bad—which the souls whose ecclesiastical allegiance had been at stake were obstinately reluctant to give up.⁴ In the pantheon of a triumphant Christianity, the figures of Cybele and Isis reasserted their power in the transfiguration of Mary the mother of Jesus into the Great Mother of God,⁵ and the lineaments of Mithras and Sol Invictus were visible in a militant presentation of Christ. Similarly, in the pantheon of a triumphant Islam, a banished God Incarnate stole back into an empty place in hungry hearts in the guise of a deified 'Ali, while a forbidden idolatry reasserted itself in the Founder's own act of consecrating the fetish-worship of the Black Stone in the Ka'bah at Mecca.

² On this point see pp. 105–8, above.

³ Mark xvi. 15.

⁴ On this point, see further pp. 457, 467, and 716–36, below.

⁵ Eastern Orthodox and Western Catholic Christians did not, of course, admit that the honour paid by them to the Theotókos amounted to the apotheosis from which it was indistinguishable in Muslim, in Eastern Iconoclast Christian, and in Western Protestant Christian eyes (see further pp. 457, 467, and 716–36, below).

'All religions, without exception, in order to overcome the obstacles that retard their progress, have had to come to terms with the forces that they have been combating, and to succumb to some extent to the very evils against which it has been their mission, and indeed their *raison d'être*, to wage war. . . . This law holds good for all the great [ways of life] that have been evolved by Man, and, above all, for Islam. Though Islam came into being in order to give the Arabs a religion and to raise them out of a particularly crass form of idolatry, it was compelled to purchase its triumph at the price of taking political form and substance and turning itself into a theocracy. It was only then, when it had absorbed, in a diluted and modified form, the very elements which, in the beginning, it had been its special mission to suppress, that Islam found itself able to start the work of moral and religious reform in the Arabian Peninsula and in a large part of [the rest of] the medieval world.'

Even the victors in a religious war *à outrance* have found themselves constrained to adopt their defeated adversaries *sub rosa* as members of their own household. Nevertheless, the difference between the two alternative denouements to a competition between higher religions is morally momentous; and the children of a twentieth-century Western Civilization could not be indifferent about the prospects in their own case.

Which of the two alternatives was the more likely to be the destiny of a Westernizing Modern World? In the past, intolerance had gained the mastery where higher religions of Judaic origin had been in the field,² while 'live and let live' had been the rule where the Indic *éthos* had been paramount. Which of these two spirits was going to prevail in a Westernizing World in the coming chapter of its history? The Judaic vein in Christianity and Islam? Or the Indic vein in the Mahāyāna and

¹ Caetani, L.: *Studi di Storia Orientale*, vol. iii (Milan 1914, Hoepli), p. 139. In the Prophet Muhammad's career the classical example of a compromise with the primitive practices of the pre-Islamic 'Times of Ignorance' is his deal with the Quraysh in A.H. 9 (see *ibid.*, pp. 270-3). In exchange for a genuine acceptance of the sovereignty of the Medinese theocracy and a nominal acceptance of Islam, Muhammad assured to the Quraysh the continuance of their profits from their management of the sanctuary of the Ka'bah by incorporating into Islam, virtually intact, the pagan rites of the annual pilgrimage to Mecca. In this case the practical consecration of a theoretically execrated pagan past was unusually deliberate.

² The melancholy historical fact that the transition from a pagan parochialism to a Christian universalism was accompanied by a change of religious climate from tolerance to intolerance has been noticed in IV. iv. 226-7. The following comment on the same phenomenon from the pen of Eduard Meyer (*Ursprung und Anfänge des Christentums*, vol. iii (Stuttgart and Berlin 1923, Cotta), p. 633) is bitter yet not unjust:

'The accepted basis of association is no longer the natural community based on kinship and neighbourhood, but a unanimity of feeling and of creed which is supposed to proceed from a common conviction—though in reality it often boxes the compass by turning into a merely external assent. This is the outlook which now at once asserts itself everywhere and which has continued to dominate the succeeding millennia. A state which had been the natural outgrowth of the practical conditions of earthly life, and which had provided complete freedom for the individual to think his own thoughts, is now replaced by the ideal of a supernatural church, guided by God, which ruthlessly suppresses and eradicates any departure from orthodoxy—even if it is only a question of a single word. To protect the Church, and to impose her unity on all Mankind, now becomes the most important—and, in the last analysis, the only true—task of the State. There has been no religion in which this fanaticism—this persecution of all heterodox opinions without regard for the consequences and without shrinking from any crime—has been, and remained, so dominant as it has in Christianity in all its manifestations. This is a signally glaring example of the operation of the law that an idea, in translating itself into reality, boxes the compass by turning into its own antithesis.'

Hinduism? The historical precedents suggested that the answer to this question might be determined by the nature of the alien adversaries whom the higher religions would find in their path at this point.

Why did Christianity, which appeared to have taken a decisive new departure from Judaism by recognizing and proclaiming that God is Love, readmit the incongruous Israelitish concept and service of 'the Jealous God' Yahweh¹ without heeding Marcion's prophetically warning voice? This partial spiritual regression, from which Christianity had suffered grievous spiritual damage ever since, was the price that Christianity had had to pay for her victory in her life-and-death struggle with the worship of Caesar.² This religious war had to be fought—and fought to a finish—because Man's corporate worship of Humanity in the shape of an oecumenical commonwealth was the most insidious form of idolatry that the worshippers of the One True God could have encountered. Compromise was impossible—all the more so because this Caesar-worship stood for an ideal that was noble and beneficent within the range of its own lights. The Great Romano-Christian religious war was impossible to avoid, and, once started, it could have no end short of unconditional surrender on the part of one or other belligerent. In this tragic conflict it was in vain for Christians to inscribe 'God is Love' on their war-flag. Love had to cede the high command to Jealousy if defeat was to be inflicted upon Caesar; and the restoration of peace through the Church's victory did not dissolve, but, on the contrary, confirmed, the incongruous association of Yahweh with Christ; for in the hour of victory the intransigence of the Christian martyrs degenerated into the intolerance of Christian persecutors who had picked up from the martyrs' defeated pagan opponents the fatal practice of resorting to physical force as a short cut to victory in religious controversy.³

This early chapter in the history of Christianity was ominous for the spiritual prospects of a twentieth-century Westernizing World, because the worship of Leviathan, on which an infant Christian Church had inflicted a defeat that had appeared to be decisive, had afterwards been conjured back from limbo to haunt both Eastern Orthodox and Western Christendom.⁴ In the Orthodox Christian World a ghost of the Roman Empire had been successfully resuscitated as early as the eighth century of the Christian Era⁵ and had survived the catastrophe which it had brought upon the main body of Orthodox Christendom in the tenth century⁶ to become the master institution of an offshoot of Orthodox Christendom in Russia.⁷ In the Western World an Austrasian Charlemagne's fortunate failure to emulate the political achievement of a Leo Syrus had been eventually frustrated by the sinister emergence of a totalitarian type of state in which the Modern Western genius for organization and mechanization had been enlisted, with diabolic ingenuity, for the purpose of enslaving souls as well as bodies to a degree

⁷ See pp. 31-40, above.

which had not been within the power of even the worst-intentioned tyrants at other times and in other societies.

Moreover, these two monstrous growths of resurgent Caesar-worship had cross-fertilized one another. The tradition of autocracy, which Hitler, Mussolini, and Napoleon had ultimately derived—through eighteenth-century Transalpine ‘enlightened monarchs’ and fourteenth-century Italian despots—from the Holy Roman Emperor Frederick II Hohenstaufen,¹ had been conveyed to this official successor of Charlemagne by the political atmosphere of his Kingdom of the Two Sicilies, which was a successor-state of Leo Syrus’s East Roman Empire.² In later chapters of the melancholy history of the relations between Western and Orthodox Christendom, this inauspicious loan was repaid with interest, twice over, when first Peter the Great, and after him the Bolsheviki, envenomed the native Byzantine autocratic tradition of Muscovy by doctoring it with the latest brews of Modern Western political alchemy.³

In Western souls at the time of writing, this appalling renaissance of a demon that had afflicted the declining years of the apparented Hellenic Society was ‘projected’ (in the language of the psychologists) upon its contemporary manifestation in the Russian World in the shape of the Soviet Communist régime; but the terror which Russian Communism was inspiring in Western hearts betrayed their awareness that the Western World was also favourable soil for the tares of totalitarianism. It looked as if, in a Modern Westernizing World, the war between God and Caesar might have to be waged once again; and it also looked as if, in that event, the morally honourable yet spiritually perilous role of serving as the church militant would once again fall upon Christianity.

Of the four living higher religions, the Mahāyāna and Hinduism were disqualified for undertaking this grim task by the spirit of tolerance that was a characteristic virtue of each of them, while Islam, which was armed with the necessary intolerance in ample measure, would be seriously embarrassed, in a *jihād* against Leviathan, by its Founder’s *hijrah* from a prophet’s bed of thorns to a prince’s curule chair.⁴ In these circumstances it could be foreseen that, if the battle were joined again between God and Caesar, the Christian Church would again be the protagonist on God’s behalf, and might again have to pay the spiritual price that is exacted by militancy even in just wars waged for good causes. The price paid by Western Christendom for the Primitive Church’s victory in a three-hundred-years’ war against Caesar-worship had been a fourteen-hundred-years-long service of a God who resembled the God of Joshua more closely than the God of Jesus;⁵ and, when at last the archaic image of Yahweh ‘the man of war’⁶ had lost its hold on Western hearts, the

⁵ Mr. Martin Wight comments on this passage: ‘This seems incompatible with the description of the Church, on p. 563, below, as “an incomparably effective institution” for preserving the Christian revelation’. The writer’s answer is that institutions preserve revelations ‘in cold storage’.

⁶ Exod. xv. 3, quoted on p. 433, above.

consequent spiritual vacuum had remained a waste land tenanted only by the barren spirits of scepticism and cynicism.¹ Christians born into the twentieth century of the Christian Era had to reckon with the possibility that a second war with Caesar-worship might cost the Christian Church a second set-back of the kind, before she had recovered from the first. Yet, if they had the faith to believe that, in the end, the revelation of God as Love incarnate in a suffering Christ would turn stony hearts into hearts of flesh,² they might venture to peer into the prospects for Religion in a politically united world that would have been liberated by the Christian revelation from the worship of Yahweh as well as from the worship of Caesar.

A reconciliation, on Christian initiative, between hitherto exclusive-minded religions was not a chimaerical hope to cherish; for Mankind had already had an earnest of its fulfilment in the first chapter of the history of the impact of a Modern Western Christendom upon the rest of the World. In the sixteenth and seventeenth centuries of the Christian Era the Jesuit missionaries had aspired to attract the Hindus and Buddhists and Shintoists and Confucians of India and Japan and China, in their millions, into the fold of the Roman Catholic Christian Church; and they had entered upon the gigantic task that they had set themselves in a spirit of charity which might have blessed their endeavours if they had not eventually been frustrated by the intervention of higher ecclesiastical authorities. Instead of dwelling on the points of difference between the existing religions and philosophies of the non-Christian majority of Mankind and their own Catholic Christian faith, the Jesuits had dwelt on the points of likeness, and, from this angle of spiritual vision, they had been able to approach these alien faiths with sympathy, understanding, and reverence instead of animus, prejudice, and scorn.

This Christian charity was remarkable in an age when Christianity was still glowing with a militancy that had been kindled in the hearts of the Early Christian martyrs, and when, in Western Christendom, this fire had been stirred into a fiercer flame by the recent schism between Catholics and Protestants. It is, indeed, more surprising that the Jesuit missionaries of the Early Modern Age should have been capable of that degree of charity and insight than that the Vatican, at the prompting of rival missionary orders, should have condemned and banned the Jesuit line of approach as a theologically illegitimate condonation of pagan practices and beliefs.³ In the eyes of a latter-day Western Christian historian, looking back on this incident in the Time-perspective of the quarter of a millennium that had since elapsed, those truly Christian-minded early Jesuit missionaries seemed to have been, not out of their reckoning, but before their time. In his outlook, the future lay with the spirit of Matteo Ricci, the Jesuit father who had also been a Confucian litteratus, and whose childlike Christian charity had not been smothered by his formidable intellectual freight of Christian theological and Sinic

philosophical erudition. Charity is the mother of insight, and in A.D. 1952 there was still time for Saint Ambrose, sitting at Father Ricci's feet and praying for the spiritual welfare of a twentieth-century oecumenical commonwealth of literally world-wide extent, to perceive and confess that the moral victor in A.D. 384 had been, not the politically triumphant Christian advocate of intolerance, but his politically defeated pagan opponent.¹ It had been Symmachus, not Ambrose, who had had the last word on a question that had been at issue in their world in the fourth century of the Christian Era, and that was at issue still in the twentieth century throughout a now literally world-wide *Oikoumenê*. Is uniformity or diversity more blessed in the practice and presentation of Religion? Symmachus assuredly divined and proclaimed the truth when he pleaded that 'the heart of so great a mystery can never be reached by following one road only'.²

The Value of Diversity

Uniformity is not possible in Man's approach to the One True God because Human Nature is stamped with the fruitful diversity that is a hall-mark of God's creative work,³ and psychologically diverse human souls need different lenses for seeing, through a glass,⁴ a Beatific Vision in which, if we could see God face to face, we should find that there 'is no variableness, neither shadow of turning'⁵—as we must believe by faith, here and now, since God's ineffable brightness is never revealed, utterly unveiled, to the naked eye of Man's frail spirit in its passage through This World. 'The true light, which lighteth every man that cometh into the World',⁶ has to be received by every creature according to the particular lights with which the Creator has endowed it. To enable human souls to receive the divine light is the purpose for which Religion exists, and it could not fulfil this purpose if it did not faithfully reflect the diversity of God's human worshippers. On this showing, it might be surmised that the way of life offered, and the vision of God presented, by each of the living higher religions might prove to correspond to one of the major psychological types whose distinctive lineaments were gradually being brought to light by twentieth-century Western pioneers in a new field of human knowledge.⁷ If each of these religions did not genuinely satisfy some widely experienced human need, it is indeed hardly conceivable that each of them should have succeeded, as each had done, in securing the allegiance of so large a portion of the Human Race. 'Every good gift and every perfect gift is from above, and cometh down from the Father of lights',⁸ and, if the followers of the living higher religions were to recognize reciprocally the common

⁷ A tentative interpretation of the four living higher religions in terms of the scheme of psychological types propounded by C. G. Jung will be found on pp. 716–36, below.

⁸ James i. 17.

origin of all these gifts of God,¹ they might win a life-giving liberation from the self-stultifying impulse that had moved them to thwart themselves by thwarting one another from fulfilling their common destiny.

This destiny, to which assuredly they had been called if the call had truly come from God, was that they should each go into all the world² without conflicting with one another. Their spiritually regressive political vested interest of serving as tribal religions for regimented continents would then be relinquished in order to free each of them for fulfilling a world-wide mission of revealing God to individual souls which would have chosen this particular communion in the light of their personal needs and capacities instead of having inherited it through the accident of birth. In that hour of reconciliation through enlightenment,

'the wolf . . . shall dwell with the lamb, and the leopard shall lie down with the kid; and the calf and the young lion and the fatling together; and a little child shall lead them'.³

In this light the diversity of the living higher religions would cease to be a moral stumbling-block and would reveal itself as a necessary corollary of the diversity of the Human Psyche. It was a necessity if there was truth in the Christian intuition that God is Love; for Love seeks to draw all men unto Him;⁴ and His desire to beatify all His creatures by bringing them into communion with Himself would perforce remain unfulfilled if one road only were open for approaching the great mystery; for in that case the common goal of all men's endeavours would be attainable only by one arbitrarily favoured fraction of Mankind that happened to be psychologically equipped for following this particular spiritual path. Any such conclusion had been rejected by the Christian Church itself when it had expressed its intuition that God is Love in a doctrine that the door of salvation stands open for all men, including those outside the Christian Church's fold. A Symmachan-minded disciple of C. G. Jung who had retained the Christian vision of God's nature from a Christian upbringing would hold that, if the revelation of the One True God is to be accessible to all men, it has to be diffracted; but in holding this he would be holding, in common with his Christian predecessors and contemporaries, that the different rays that reach and illumine diverse souls are radiations of one light from one source.

'There are diversities of gifts, but the same Spirit. And there are differences of administrations, but the same Lord. And there are diversities of operations, but it is the same God which worketh all in all. But the manifestation of the Spirit is given to every man to profit withal'.⁵

This necessary diffraction of the divine light in its manifestation to diverse souls is a challenge to the recipients, like God's other dispensations to His creatures. It is a stumbling-block for them as well as an

¹ 'Part of the Christian answer to this argument (inasmuch as Christianity makes exclusive claims) is contained in the simile of "veils differing from one another in their degree of opaqueness" which you use below, on p. 461.—Martin Wight.

² Mark xvi. 15.

⁴ John xii. 32.

³ Isa. xi. 6.

⁵ 1 Cor. xii. 4-7.

opportunity; for diversity can breed a destructive discord as well as a creative harmony. The catastrophe that Phaethon brought upon himself by attempting to drive the four-horse chariot of his Father Helios might not have overtaken the unfortunate demigod if the heavenly vehicle had been a one-horse shay. In the relations between the living higher religions in the twentieth century of the Christian Era the heavenly harmony that was audible to the ear of faith was being mocked, as we have seen, by a hideous discord that was the official order of the day; and faint hearts might doubt whether this very present hazard of the ordeal of diversity were indeed worth the bare chance of winning the possible prize. The answer was that the hazardously aspiring unity-in-diversity of a harmony has in it virtue that is not to be found in a safely pedestrian unison. The one-horse shay is a safe form of conveyance just because it is incapable of mounting to the zenith. The quadriga may bear Phaethon heavenward to a height from which a fall spells death; yet, by the same token, it—and no vehicle of lesser power—can carry Helios in triumph from horizon to horizon.

What, midway through the twentieth century of the Christian Era, were the omens for Man's air-borne religious quest? The last chapter had ended on an inauspiciously discordant note; yet, if any credit could be given to the findings of a tentative reconnaissance into the future, there were grounds for hope that, in the next chapter, the diversity of religions might resolve itself into a harmony in which the unity of Religion would be made manifest. In the light of this prospect, an anxious observer need not be unduly dismayed to see the mettlesome chariot-horses pulling restively against one another. On the longer view that was visible to the eye of faith, it could be forecast that the driver would master his team and that the chariot would continue to mount on the heavenward course that it had been following continuously since before Abraham was.¹

The Role of the Civilizations

If this view of the prospects of Religion were to carry conviction, it would open up a new view of the role of the civilizations. If the movement of the chariot of Religion was continuous in its rise and constant in its direction, the cyclic and recurrent movement of the rises and falls of civilizations might be not only antithetical but subordinate. It might, as we have surmised,² serve its purpose, and find its significance, in promoting the fiery chariot's ascent towards Heaven by periodic revolutions on Earth of 'the sorrowful wheel' of birth-death-birth.

In this perspective the civilizations of the first and second generations might justify their existence,³ but those of the third generation would

¹ John viii. 58.

² On pp. 423-5, above.

³ On this view the rises and falls of the civilizations of the first and second generations would be a valuable, and perhaps indispensable, stage of human experience between the primitive societies and the higher religions; for, if learning comes through suffering, the experience of a civilization would have an educative effect which the experience of a primitive society could not provide. One of the obvious specific differences between civilizations and primitive societies was the immense disparity in the mass and weight of their respective corporate power (see I. i. 148-9). In consequence, there was, for good

cut a disconcertingly poor figure. If civilizations were the handmaids of Religion, and if the Hellenic Civilization had served as a good handmaid to Christianity by bringing this higher religion to birth before that civilization had finally fallen to pieces, then the civilizations of the third generation would appear to be 'vain repetitions' of the heathen.¹ If, so far from its being the historical function of higher religions to minister, as chrysalises, to the cyclic process of the reproduction of civilizations, it was the historical function of civilizations to serve, by their downfalls, as stepping-stones for a progressive process of the revelation of always deeper religious insight,² then the societies of the species called civilizations would have fulfilled their function when once they had brought mature higher religions to birth; and, on this showing, a Western post-Christian secular civilization might at best be a superfluous repetition of the pre-Christian Hellenic Civilization, and at worst a pernicious backsliding from the path of spiritual progress. The one conceivable historical justification for its otherwise inauspicious existence would be the possible future service that it might inadvertently perform for Christianity and her three living sister religions by unintentionally providing them with a mundane meeting-ground on a literally world-wide range,³ by bringing home to them the unity of their own ultimate values and beliefs, and by confronting them all alike with the challenge of a recrudescence of idolatry in the peculiarly vicious form of Man's corporate worship of himself.⁴

Meanwhile, in a secularized Western World in the twentieth century of the Christian Era, symptoms of spiritual backsliding were unmistakably manifest. The recrudescence of Leviathan was a religion to which every latter-day Westerner paid some measure of allegiance; and this Modern Western renaissance of the tribal religion of the Hellenic World in its unregenerate days,⁵ before it had been purified from the sin of parochialism in the furnace of suffering, was, of course, sheer idolatry. Communism, which was another of Western Man's latter-day religions, had the merit of being a leaf taken from the book of Christianity, but it was a leaf taken in vain through being torn out and misread;⁶ and Democracy, which was another leaf from the book of Christianity, had also been torn out and, while perhaps not misread, had certainly been half-emptied of meaning by being divorced from its Christian context and being secularized. Perhaps the most ominous symptom of all was that, for a number of generations past, people in the Western World had been living on spiritual capital—clinging to Christian practice without holding Christian beliefs. This was ominous because practice

or evil, an immensely greater 'drive' behind human acts which had a civilization for their social setting; and, in consequence of this in turn, the catastrophes caused by the mismanagement of a civilization's corporate power were likely to make a deeper and more lasting impression on the Soul than their counterparts in primitive life.

⁴ See pp. 439-41, above; pp. 478-9 and 524-5, below.

⁵ This renaissance is discussed further in X. ix. 7-8.

⁶ See V. v. 581-7, and pp. 534-5, below.

unsupported by belief is a wasting asset, as Western Man in this generation had discovered to his dismay.

If this self-criticism was just, the children of the Western Civilization must revise the whole of their current conception of recent history; and, if they could make the effort of will and imagination to think this ingrained and familiar conception away, they would arrive at a very different picture of the historical retrospect. Westerners of the writer's generation not only took it for granted that the Christian Church had served its turn in bringing a new civilization to birth in the West; they looked upon this new civilization as having been immature so long as it had remained under Christian auspices; and, after having waited with impatience for it to get through its medieval Christian childhood, and having joyfully greeted the repudiation of its Christian origins with which it had celebrated its coming of age,¹ they had focused their attention on the rise of a Modern Western secular way of life. As they followed that rise, from the first premonition of it in the genius of Frederick II Hohenstaufen,² through the renaissance of Hellenic culture in an Italian cradle, to the Transalpine eruption of Democracy and Industrialism under the pagan auspices of a modern scientific technique, they thought of this secular movement as being the great new event in the World which demanded their attention and deserved their admiration. If they could bring themselves to think of it, instead, as being one of the 'vain repetitions' of the heathen—an almost meaningless repetition of something that the Hellenes had done before them, and done supremely well³—then the greatest new event in the historical background of a Modern Western Society would be seen to be a very different one. The greatest new event would then not be the monotonous

¹ See I. i. 34.

² See pp. 402 and 440, above; pp. 537-9, below; and IX. viii. 394-5.

³ In a previous passage of this Study (in II. ii. 355-7) we have noticed the 'family likeness' between the Hellenic Civilization and the abortive Scandinavian Civilization. The Scandinavian, like the Hellenic, was distinguished by a precocious freshness and originality and a precocious clarity and rationalism, and we have ascribed these distinctive qualities, which the two civilizations display in common, to a similarity in the circumstances in which they came to birth. While either was affiliated to an antecedent civilization, the affiliation was, in either case, through the antecedent civilization's external proletariat, and this was a looser link than the alternative form of affiliation through a chrysalis church provided by the antecedent civilization's internal proletariat. In the same context (*ibid.*, pp. 357-60) we went on to observe that this thesis appeared to be borne out by the confusion and obscurity into which Scandinavian minds fell after an abortive pagan Scandinavian Society had been absorbed into the alien body social of Western Christendom and had thereby been condemned to wrestle with the impossible task of reconciling an exotic Helleno-Syriac culture with its own native pagan Scandinavian cultural heritage. The impossibility of this mental *tour de force* is vividly illustrated by the incongruousness of the catalogue of the books in the library of a fourteenth-century Icelandic, Hauk Erlendsson (see *ibid.*, pp. 358-9).

This evidence suggests that, for the flowering of a secular culture, the most favourable field is a civilization of the second generation that is affiliated to a predecessor through barbarian intermediaries, and not a civilization of the third generation that is affiliated to a predecessor through a chrysalis church. If this was the truth, the neo-pagan civilizations of the third generation seemed likely to prove themselves to be a lower form of society than the palaeo-pagan civilizations of the second generation and the first. In that event, a civilization of the second generation that had helped to bring to birth something higher than itself in serving as an overture to a church would prove to have lapsed into bringing to birth something lower than itself if, in the next chapter of the story, the adolescent church were checked, and perhaps even blighted, in its growth by the outbreak of a new secular civilization. (On this point see, further, pp. 533-44, below.)

rise of yet another secular civilization out of the bosom of the Christian Church in the course of these latter centuries; it would still be the Crucifixion and the Crucifixion's spiritual consequences.

On this view, students of History would likewise have to revise the current Western conception of the service of Christianity and the other higher religions as chrysalises. They must conclude that, in assisting civilizations of the second generation to reproduce themselves in a third generation, the higher religions had responded to the call *noblesse oblige* at a cost which, at its lightest, would amount to an unprofitable digression from their own proper path and postponement of their entry upon their own true calling, while at its heaviest it might drag them down to the tragic ending of *Beauchamp's Career*. It would be a supreme tragedy, on the face of it, if a fully-fledged higher religion were to compromise its own future for the sake of bringing a civilization of the third generation to birth, because it would be sacrificing itself to secure the reproduction of a secular institution which was not only intrinsically inferior to its religious chrysalis but was now also superfluous in virtue of the faithful fulfilment, by civilizations of a preceding generation, of their specific mission of giving the higher religions an opportunity of coming to flower. The civilizations would be in the same relation to the higher religions as the primitive societies to the civilizations. When the primitive societies had succeeded in giving birth to civilizations, they had performed their task and exhausted their mandate, and, in the new chapter thereby opened in the history of Mankind, no civilization had ever sacrificed itself for the perversely anachronistic purpose of assisting the surviving primitive societies to reproduce their outmoded kind. Why should higher religions perform unprecedented acts of self-sacrifice in order to bring into the World a new litter of outmoded civilizations? If there were any justification for this folly, it would not be found in reason but in the intuition that 'God hath chosen the foolish things of the World to confound the wise'.¹ A church which stepped aside from its course and forbore to press forward towards its goal, in order to minister to a dying civilization and to nurse an infant civilization in its cradle, might save its life—if it did save it—by losing it for Christ's sake and the Gospel's²—like the pilgrim in Tolstoy's tale³ who won God's grace when he earned his obtusely pharisaical travelling companion's contempt by fulfilling his pilgrimage in the spirit at the sacrifice of the letter.

In submitting to serve as chrysalises for civilizations, the living higher religions might indeed have compromised their own future if it were true that this service was their *raison d'être*. In tiding over the interregna between civilizations of the second and third generation and duly bringing civilizations of a third generation to birth, the living higher religions would then have exhausted their mandates, and, while there might be no reason to expect that the latest crop of civilizations would not eventually go the way of their predecessors, there would be still

¹ 1 Cor. i. 27, quoted in IV. iv. 249 and in V. vi. 150.

² Matt. x. 39 and xvi. 25; Mark viii. 35; Luke ix. 24 and xvii. 33; John xii. 25.

³ *Two Old Men*, cited on p. 391, above.

less reason to expect that the higher religions which had brought them to birth would live to survive, or even witness, their demise. On the hypothesis that higher religions come and go for the convenience of falling and rising civilizations, we should expect to see the civilizations of the third generation providing, as providently as their predecessors, for the propagation of their species by conscripting new religions to serve as new chrysalises for tiding over new interregna and bringing a new generation of civilizations to birth.

Candidates for this *corvée* were in fact, as we have seen, in the field in the shape of rudiments of secondary higher religions that had been created by the internal proletariats of living non-Western civilizations which had latterly been enmeshed in an expanding Western Society's world-encompassing net; but there was no warrant for expecting to see History repeat itself by casting this new batch of religions for this old role if the truth lay, not in the chrysalis theory, but in its converse. If the truth was that Religion is the true end of Man, and that civilizations have their *raison d'être* in ministering to spiritual progress, then, once again, a civilization might break down, but the replacement of one higher religion by another need not be a necessary consequence. So far from that, it might be augured that, if a secularized Western Civilization were to break down in its turn after having swept all its contemporaries into its net, the living higher religions would not only survive but would grow in wisdom and stature as the result of a fresh experience of secular catastrophe. The spiritual insight that they might gain through further suffering might lead them, as we have suggested, to a mutual recognition of their own essential unity in diversity. As for the rudiments of secondary higher religions which were visible in the twentieth century of the Christian Era in the oecumenical landscape, these might be drawn back into the main stream of Mankind's religious life, to make creative contributions to its flow in this reach of the river, or they might drain away into the desert and lose themselves in its sands; but there was no reason—if the assiduous provision of chrysalises were not assumed to be Religion's *raison d'être*—for expecting to see these secondary higher religions supplant Hinduism, Christianity, Islam, and Buddhism as these four living higher religions themselves had supplanted the paganism of Primitive Mankind.

If we now look again at our table, we shall see that the serial order in which the societies are there displayed is not only chronological and genealogical but is also qualitative. In the light of our intervening investigation, the order reveals itself as an ascending scale of values in four degrees:

4. Higher Religions.
3. Secondary Civilizations.
2. Primary Civilizations.
1. Primitive Societies.

In this new value-scale, two of our three familiar species of human society, the higher religions and the primitive societies, reappear, with their identities unchanged, at the top and the bottom of the ladder. The

third species, on the other hand, has lost an identity with which we have credited it since our judgement, at an early stage in this Study, that all civilizations are philosophically equivalent.¹ This judgement is assuredly true as far as it goes; and it has not played us false so long as we have been dealing with the civilizations themselves, in their geneses, growths, breakdowns, and disintegrations, as the ultimate objects of our inquiry. Now, however, that our Study has carried us to a point at which the civilizations in their turn, like the parochial states of the Modern Western World at the outset of our investigation, have ceased to constitute intelligible fields of study for us and have forfeited their historical significance except in so far as they minister to the progress of Religion, we find that, from this more illuminating standpoint, the species itself has lost its specific unity. In our new list of societies arranged in a serial order of ascending value, the primary and secondary civilizations appear as separate categories, differentiated from one another and located on different qualitative levels by the difference in value between their respective contributions to the achievement of bringing the higher religions to flower. As for the civilizations of the third generation, they are now right out of the picture.

(b) THE SIGNIFICANCE OF THE CHURCHES' PAST

In coming to the conclusion reached at the close of the preceding chapter, we are merely applying to all eight of the living civilizations a judgement which the children of the Western Civilization in its latest phase had confidently passed upon their own society's seven sisters. In diagnosing the symptoms of breakdown and dissolution in the present state of these seven other civilizations of the third generation, a student of History midway through the twentieth century of the Christian Era was not flying in the face of current opinion in the West; for, even after having run into two general wars in one lifetime and having been kept, by the aftermath of the second war, in haunting fear of the advent of a third, Western Man had not yet been cured of his conviction that he was 'not as other men are';² and so he still saw nothing paradoxical or questionable in the proposition that the Western Civilization was the only society of its kind that still had a future. On this Modern Western view, on which a latter-day secularized Western Civilization was the climax of human achievement, the other living civilizations were put out of court automatically, while the extinct civilizations could not hope to be awarded even a posthumous patent of nobility except in so far as their advocates could prove that they had had some hand in making the Western Civilization what it had come to be. In an intellectual milieu in which this was accepted as a reasonable view, there should have been nothing very shocking in the alternative suggestion that a rather larger number of the extinct civilizations had 'made good', and that all eight, instead of seven, of the living civilizations were 'on the shelf'. Yet, even so late in the Western Civilization's day as the year A.D. 1952, this variation on the conventional Western view could hardly

¹ See I. i. 175-7.

² Luke xviii. 11.

be suggested in Western circles without raising an uproar there; for, even if the traditional Western rationalist, in an elegiac mood, were to acquiesce in seeing the Western Civilization deposed from the place of honour in the moving picture of human progress up to date, he would be moved to indignation and mockery at the notion of assigning the vacated place to Religion.

'This mountebank', the affronted Western rationalist would exclaim, 'is trying to pass off, as the last word in wisdom, one of the most naïve of all the commonplaces with which the professional apologists of the so-called "higher religions" have sought to impose upon Mankind ever since an apology was first called for by the simultaneous social triumph and moral bankruptcy of these extraordinary ecclesiastical institutions that the apologists have undertaken to defend. The fallacy in this commonplace has been exposed already a thousand times over in as many years. The trick, whether performed disingenuously or in childish good faith, is, after all, a simple one. You have merely to ascribe to a church the virtues preached in the scriptures attributed to the church's founder, and your church inevitably takes the highest place on the ladder. The trick, however, is as easy to unmask as it is to play. To unmask it you have merely to re-direct the observer's attention from the alleged ideals of the church's founder to the current practice of the church as it can be observed at first hand in the observer's own day. Look around you. Behold Christianity, the Mahāyāna, Islam, and Hinduism not as they claim to be but as they are, and your judgement of relative values will register a very different result. Call the insight of the prophets a flash if you will, so long as you admit that it has been a flash in the pan.'

This line of attack on the living higher religions may be illustrated by quotations from the works of a pioneer Western rationalist of the generation that had seen the end of the Wars of Religion and a latter-day follower of the same school who had lived to see the onset of the Wars of Ideology.

In an appeal addressed by Bayle to his Roman Catholic countrymen and contemporaries, the *déraciné* French philosopher pleads:

'Je voudrais que vous entendissiez ceux qui n'ont d'autre religion que celle de l'équité naturelle. Ils regardent votre conduite comme un argument irréfutable, et lorsqu'ils remontent plus haut et qu'ils considèrent les ravages et les violences sanguinaires que notre religion catholique a commises pendant six ou sept cents ans par tout le monde, ils ne peuvent s'empêcher de dire que Dieu est trop bon essentiellement pour être l'auteur d'une chose aussi pernicieuse que les religions positives; qu'il n'a révélé à l'homme que le droit naturel, mais que des esprits ennemis de notre repos sont venus de nuit semer la zizanie¹ dans le champ de la religion naturelle, par l'établissement de certains cultes particuliers, qu'ils savaient bien qu'ils seraient une sémence éternelle de guerres, de carnages et d'injustices. Ces blasphèmes font horreur à la conscience; mais votre Église en répondra devant Dieu.'²

Frazer, writing more than two hundred years later, can venture to go

¹ Matt. xiii. 25.

² Bayle, P.: *Ce que c'est que la France Toute Catholique sous le Règne de Louis le Grand* (Saint-Omer 1686, Lami).

farther with himself and with his readers. While Bayle professes to be distressed at finding that the perversion of Religion should have given her enemies an occasion to blaspheme, Frazer professes partially to condone the perversion by presenting, in the ironical form of an apologia, a radical criticism of Religion itself. He offers the devastating suggestion that a cynical adulteration of the pure milk of the word may have saved the lives of a flock that would probably have starved if it had been forced to remain for very long on so ethereal a diet.

'Taken altogether, the coincidences of the Christian with the heathen festivals are too close and too numerous to be accidental. They mark the compromise which the Church in the hour of its triumph was compelled to make with its vanquished yet still dangerous rivals. The inflexible Protestantism of the primitive missionaries, with their fiery denunciations of heathendom, had been exchanged for the supple policy, the easy tolerance, the comprehensive charity of shrewd ecclesiastics, who clearly perceived that if Christianity was to conquer the World it could do so only by relaxing the too rigid principles of its Founder, by widening a little the narrow gate which leads to salvation.

'In this respect an instructive parallel might be drawn between the history of Christianity and the history of Buddhism. Both systems were in their origin essentially ethical reforms born of the generous ardour, the lofty aspirations, the tender compassion of their noble Founders, two of those beautiful spirits who appear at rare intervals on Earth like beings come from a better world to support and guide our weak and erring nature.¹ Both preached moral virtue as the means of accomplishing what they regarded as the supreme object of life, the eternal salvation of the individual soul, though by a curious antithesis the one sought that salvation in a blissful eternity, the other in a final release from suffering, in annihilation. But the austere ideals of sanctity which they inculcated were too deeply opposed not only to the frailties but to the natural instincts of Humanity ever to be carried out in practice by more than a small number of disciples, who consistently renounced the ties of the family and the state in order to work out their own salvation in the still seclusion of the cloister. If such faiths were to be nominally accepted by whole nations or even by the World, it was essential that they should first be modified or transformed so as to accord in some measure with the prejudices, the passions, the superstitions of the vulgar. This process of accommodation was carried out in after-ages by followers who, made of less ethereal stuff than their masters, were for that reason the better fitted to mediate between them and the common herd. Thus as time went on the two religions, in exact proportion to their growing popularity, absorbed more and more of those baser elements which they had been instituted for the very purpose of suppressing.

'Such spiritual decadences are inevitable. The World cannot live at the level of its great men. Yet it would be unfair to the generality of our kind to ascribe wholly to their intellectual and moral weakness the gradual

¹ 'The historical reality both of [the] Buddha and of Christ has sometimes been doubted or denied. It would be just as reasonable to question the historical existence of Alexander the Great and Charlemagne on account of the legends which have gathered round them. The great religious movements which have stirred Humanity to its depths and altered the beliefs of nations spring ultimately from the conscious and deliberate efforts of extraordinary minds, not from the blind unconscious cooperation of the multitude. The attempt to explain History without the influence of great men may flatter the vanity of the vulgar, but it will find no favour with the philosophic historian.'

divergence of Buddhism and Christianity from their primitive patterns. For it should never be forgotten that by their glorification of poverty and celibacy both these religions struck straight at the root not merely of civil society but of human existence. The blow was parried by the wisdom or the folly of the vast majority of Mankind, who refused to purchase a chance of saving their souls with the certainty of extinguishing the species.¹

The verdict on the record of the churches which Bayle has presented as an indictment, and Frazer, more insidiously, as a defence, might be put in still stronger terms than those here employed by either of these two distinguished rationalists. The ecclesiastics who had betrayed or fulfilled their trust by bringing the churches back to Earth seemed almost to have gone out of their way to fly in the face of the founders by sinning against their principal precepts as recorded in scriptures that had been canonized by the ecclesiastics themselves. The Christian Church, for example, was open to the charge of having denied Christ by appropriating the priestcraft and pharisaism of the Jews, the polytheism and idolatry of the Greeks, and a championship of vested interests that was the legacy of the Romans; and the outcome might be described as an institution whose practice was the exact inverse of a vision which had seen God as a spirit who was to be worshipped in spirit and in truth² in a communion of saints in which the social schism between classes and states was to be healed by a union of hearts under the reign of Love.³ The Mahāyāna and Hinduism, as they presented themselves in the writer's day, were not less vulnerable to criticism, while of Islam it might be said with sorrow that the Founder himself had betrayed his own ideals in his own lifetime by becoming the successful ruler of an aggressive state.⁴ The final judgement on Religion which a rationalist line of attack implies is Lucretius's judgement on the Universe:

Nequaquam nobis divinitus esse paratam
Naturam rerum; tantâ stat praedita culpâ.⁵

And the immediate answer to both judgements is a suspensive 'Wait and see!'

The weak point in the rationalist argument was, in fact, its blindness to the implications of a Time-scale, recently established by the discoveries of a Modern Western Science, which, in a different context, the rationalist himself had eagerly turned to account as an engine for breaching the curtain-walls of religious orthodoxy.

The rationalist had legitimately pointed out that the seventeenth-century Protestant Christian chronologist Archbishop Ussher's reckoning⁶ that the World had been created at 6.0 p.m. on the evening before the 23rd October, 4004 B.C., Old Style, and the Primitive Christian expectation that the last Trump might sound any day were both incompatible with the evidence that had since come to light about the

age of the Earth up to date and about the probable prospects of life on its surface. This planet, though not an old inhabitant of the stellar—or nebular—universe, had been in existence already, it would now appear, for some two thousand million years; Life had already existed on Earth for at least five hundred million years, and perhaps eight hundred million; Human Life had existed for at least six hundred thousand years, and perhaps one million; and the lengths of time during which the Earth's surface had been tenanted by divers orders of living creatures so far were all infinitesimally short compared with the aeons during which the Earth seemed likely to continue to be habitable in the future. These aeons of possible existence ahead of Life on Earth might run into millions of millions of years.¹

This modern scientific Time-scale was brought into action by the ex-Christian Western rationalist against the contemporary Christian Western traditionalist in order to explode a traditional chronology; but the rationalist had failed to perceive that, in allowing himself this line of attack on his adversary, he had implicitly denied himself another line which implied an acceptance of the traditional chronology at its face value. The rationalist found fair game in a chronology which, should the Last Trump sound tomorrow, would have packed the World's history, from beginning to end, within a span of less than six thousand years; yet he was apt in the same breath to assert that there was nothing to be hoped for from a religion that had been in existence now for more than nineteen hundred years without having produced its promised change for the better. This arrow might well transfix the conscience of a traditionalist Christian in whose belief these 1,952 years amounted to nearly one-third of the total life-span of the World up to date; but the rationalist was logically debarred from shooting this shaft unless he first renounced his own Time-perspective and accepted his traditionalist victim's chronological tenets; for, on the rationalist's own reckoning, a period of nineteen or twenty centuries,² so far from being 'a long time',

¹ The figures here given are based on Zeuner, F. E.: *Dating the Past* (London 1946, Methuen), whose estimates for the age of diverse orders of life are higher, as will be seen, than those suggested, on the authority of Sir James Jeans, in I. i. 173, n. 2.

² The age of Christianity up to date would have to be reckoned at something between twenty-one and twenty-two centuries if we were to carry the reckoning back behind the Ministry of Jesus to include the experience of the internal proletariat of the Hellenic World during two preceding centuries of tribulation (see I. i. 40–42 and V. vi. 289). Yet, even if we were to trace the origins of Christianity as far back as the Passions of Kings Agis IV and Cleomenes III of Sparta in the third century B.C. (see V. vi. 376–539), the length of Christianity's life up to date would not have been appreciably increased on the Modern Western scientific Time-scale. The maximum reckoning was approximately the same for Christianity and for the Mahāyāna; for, though the process of the Mahāyāna's evolution was obscure, and it would have been difficult to pick out any single event that might stand for the beginning of it, even symbolically, it seemed clear that this metamorphosis of a primitive Buddhist philosophy had not begun till after the time of the Mauryan Emperor Aśoka (*imperabat* 273–232 B.C.). The origins of Hinduism could be traced back to about the same date if the distinctive note of Hinduism was held to lie in the personal relation between the god and his devotee (see V. v. 138, and p. 427, above). If, however, the criterion was to be the first appearance, not of *Bhakti*, but of a distinctively Hindu theology, the founder of Hinduism would be Śāṅkara (*floruit circa* A.D. 800) and Hinduism would have to be reckoned as being younger even than Islam, which did not come to birth till the beginning of the Prophet Muhammad's ministry *circa* A.D. 609.

Mr. John Lodge comments: 'But the Vedānta, as expounded by Śāṅkara, is based on

was no more than the twinkling of an eye. It was, in fact, so infinitesimally short that, if we offered our rationalist a whole blank folio page and asked him to plot out on it his scientific chronology to scale, he would not find room to make the span of two thousand years visible within that compass even under the lens of the most powerful microscope.

'The history of Man is immensely, incalculably old: the latest discoveries of human remains in deep geological strata in various parts of the World, corroborated by the latest conclusions of Biology, are now sufficient to prove with certainty that Man has existed for hundreds of thousands, and perhaps for millions, of years. Out of this fact there springs a singular thought: The *historical* period, extending over the last five or six thousand years, is virtually a nothing, a flash (*lampe*), when confronted with the incommensurably longer past. Indeed, when we reflect upon the rapidity with which Time flies, and upon the painfully ephemeral nature of our wretched existence, it is not difficult to reach the conviction that even the most remote historical events known to us—the foundation of the Roman Empire, the Battle of Marathon, and, no less than they, the victory of Sesostris, Pharaoh of Egypt, over the Hittites in Syria eighteen centuries before the beginning of the Christian Era—are events of yesterday that are separated from us merely by an interval of time that is infinitesimal by contrast with the boundless vista of our geological past.'

Yet, in defiance of self-consistency, the rationalist did take issue with the traditionalist on a ground that tacitly assumed the validity of the traditional Time-reckoning; and, to a detached observer of this nineteenth-century Western controversy, the points of agreement between the parties would appear more significant than the differences. For both of them it was an axiom that the Church as she was in their day gave the measure of the Church as she ever would be, world without end; and their quarrel arose over the difference in their subsequent value-judgements on the basis of their common factual premiss. In the traditionalist's eyes the Church's supposed immutability in her present shape was a glorious evidence of her divine origin and mission, while in the rationalist's eyes it was a damning confutation of the Church's extravagant claims; but the disputants agreed in their reading of the facts from which they drew these opposing conclusions, and, on the testimony of a Modern Western Science, their common reading was wrong.

The rationalist's error may be likened to the saucy townsman's when

the *Upanishads*, which go back before 500 B.C., and on the Vedic hymns, which go back before 1000 B.C. The so-called "Song of Creation" (*Rigveda* x. 129) is essential Hinduism.' The writer's answer would be that Sankara and his successors relieved Hinduism, in practice, of the incubus of the Indic Scriptures by professing to place these on a pedestal high enough to remove them conveniently out of the way.

¹ Caetani, L.: *Studi di Storia Orientale*, vol. i (Milan 1911, Hoepli), p. xiv.

Mr. Martin Wight comments: 'This passage from Caetani echoes Tacitus's discussion of chronological relativity in his *Dialogus de Oratoribus*, chap. 16, which you cite in V. vi. 80, but in a different connexion. Caetani's "historical period" of five or six thousand years corresponds to Tacitus's historical period of 1,300 years going back to Ulysses and Nestor; Caetani's "modern" period (implied but not mentioned in this passage) would correspond with Tacitus's period of "not much more than 300 years" going back to Demosthenes; and Caetani's "boundless vista of our geological past" corresponds with the *magnum et verus annus* which Tacitus derived from Cicero. J. B. Bury (*The Ancient Greek Historians* (London 1909, Macmillan), p. 254) seems to think that Tacitus was the first person who apprehended the relativity of the historical Time-scale in this way.'

he visits his country cousin and watches him sowing his seed. 'This seed has come to nothing', says the townsman as he inspects the field the day after the sowing and sees nothing there but bare soil; 'this seed has come to nothing', he repeats with still greater assurance when, revisiting the field next spring, he finds stalk and leaf with no grain in the ear. The townsman's egregious error arises from simple ignorance of the time that Life takes to bring her work of creation from seed to harvest.

The Christian traditionalist's error may be likened to the guileless Nubian's when, squatting on the desert bank of the Nile in flood, he watches the mighty brown stream swirl past him on its way from the Abyssinian Highlands to the Mediterranean Sea. The Nubian insists that this muddy mixture is pure water, and you cannot convince him of his error by ocular demonstration; for, if you pass a sample through a filter and show him the clear liquid that comes out, he tells you that this anaemic fluid is no longer water at all. 'You have robbed it', he declares, 'of all the goodness that makes water the life-giving elixir that it is.' In identifying the muddy mixture with water, our Nubian has, of course, come within an ace of arriving at the truth, if more than ninety-nine and a half per cent. of the brew in truth consists of water and less than the half of one per cent. consists of water-borne soil;¹ his error lies in stubbornly asserting that the complement of mud is not an accretion but is the water's very essence.

Our Nubian's stubbornness might relax if his vision could be expanded. Suppose that, instead of being earth-bound on his patch of river-side desert somewhere between the sixth and the first cataract, he could soar up aloft in an aeroplane, survey the basin of the Nile from Lake Tana to Rosetta, and follow from beginning to end the whole course of the natural phenomenon of which he now apprehends no more than a single phase. The truth might then dawn upon his understanding.

The truth is that the life-giving rain from Heaven comes down in such a mighty spate that, when the Monsoon discharges itself against the Abyssinian mountains and turns, on Earth, into a mighty rushing flood, it scours out the rock into gorges and carries away and along with it all manner of debris and flotsam which will fructify the seeds of vegetation if and when the water can deposit this freight as sediment. But the river cannot drop its load till its heaven-sent impetus abates, and on the Nubian stage of its long purificatory pilgrimage it is still flowing so fast that it has not yet rid itself of any of its earthy encumbrance. So it flows past the eyes of the awestricken Nubian onlooker in a thick brown stream, leaving his land unfertilized and barren. Any crop that the poor Nubian reaps is not a gift of the Nile but is a trove from some casual gust of rainfall that has momentarily moistened the dry bed of a tributary wadi.² The hurrying river passes Nubia by. It is only when it reaches the favoured land of Egypt that its pace slackens

¹ 'The maximum silt content by weight usually found in the Nile where it enters Egypt is about 4000 parts per million, and the average from August to October about 1500 parts per million' (Hurst, H. E., and Phillips, P.: *The Nile Basin*, vol. v: 'The Hydrology of the Lake Plateau and Bahr el Jebel' (Egyptian Ministry of Public Works, Physical Department, Paper No. 35 (Cairo 1938, Schindler), p. 19).

² See II. i. 308-9.

enough to allow it to begin to disburden itself. From now onwards, mile by mile, the water converts its suspended alluvium into fertile fields and, in the creative act, progressively liberates itself, until, as it leaves the utmost fringe of the Delta behind it and breasts its way out to sea, it has become once again as clear and transparent as it was when it was falling from the sky on its way to furrow a contaminating yet fructifying Mother Earth. From the steepes of Semyen to the coasts of Cyprus may seem a long road; but all distances are comparative, and the breadth of half a continent is not really long compared to the circumference of the globe; nor is the labour of carrying its freight of earth so far an unduly heavy price for the river to pay for the boon of winning a bed; for, if the teeming water's first mighty impact on the Earth had not ploughed out the *cañon* from which its tardily deposited water-borne spoil derives, who knows whether the flood would ever have made history by turning into the Nile? Who knows whether it might not have surged back, uncreative and unsung, over the wastes of the Ogaden into the abyss of its parent Indian Ocean?

The heart of the matter is the truth to which the Nubian spectator is blind. The truth is that, so long as the alluvium is held in suspense, the alluvium itself remains unfertile and the water remains impure. It is only when the flotsam is able to sink from the intellectual surface of the psychic stream to the well-springs of lowly folk-lore and lofty poetry in the Psyche's intuitive and emotional depths that this sediment can fertilize the Psyche and that, in virtue of this fruitful disentanglement of two fortuitously intermingled elements, the heavenly water of spiritual life can regain its original purity. In the Roman Catholic Church this truth had been perceived by the Modernists;¹ but their insight had drawn down upon their heads the thunderbolt of a Juppiter in Agro Vaticano² who, with his gaze fixed on the Past and averted from the Future, seemed oblivious—though his hand still held the keys—of his previous local avatar in Ianiculo as the genius who had the power to open the door because he had the vision to look before and after.³

¹ 'Evolvi . . . ac mutari dogma non posse solum sed oportere, et modernistae ipsi perfracte affirmant, et ex eorum sententiis aperte consequitur. . . .' (*Litterae Encyclicae SS. D. N. Pii P.P. X: 'Pascendi dominici gregis. . .'* (8th September, 1907)).

² 'Si quis dixerit fieri posse ut dogmatibus ab Ecclesia propositis aliquando secundum progressum scientiae sensus tribuendus sit alius ab eo quem intellexit et intelligit Ecclesia, anathema sit' (Concilium Vaticanum, 1869-70, Sessio III (24 Aprilis, 1870), canones: 4. *De Fide et Ratione*, Canon 3).

³ While the extremeness of the conservatism of the Papacy was manifestly due to the relative vastness and antiquity of the particular Christian ecclesiastical institution that was administered from the Vatican (see pp. 549-50, below), this latter-day Roman Catholic conservatism was in itself only an exaggeration of a trait which had been characteristic of the Christian Church since its infancy and which had persisted in divers degrees in all the denominations between which the Church had come to be divided. Four reasons for this conservatism of Christianity in general, and of Western Christianity in particular, have been suggested by Canon B. H. Streeter:

(i) The Church among the Gentiles was a missionary church which had hardly set to work before it found itself cut off from its base of operations owing to the rejection of Christianity by Jewry. This breach with a contemporary Jewry, which, in a sense, made the Gentile Christian Church's fortune by making it into the Christian Church *sans phrase*, had the further effect of making the Church meticulous in maintaining continuity, on its own account, with a Jewish past from which, on its own view, it derived both credentials and inspiration that it could not afford to lose.

(ii) A Christian tradition had no sooner begun to take shape than it was constrained

The legacy of the Past to the Present was indeed as precious as it was conspicuous. 'Before Abraham was, I am';¹ and, since it was not credible that God should have shown no glimmer of His light to Man before a revelation to 'Abraham' that was the traditional first epiphany of that ray of progressive enlightenment which had culminated in Christianity, students of History must also recognize true gleams of divine light in religious rites and symbols, older than Abraham's day, that had been caught up and carried along in the latter-day Christian stream.²

'The calling of Abraham' itself might be an echo of one of the spiritual experiences of a disintegrating Sumeric Civilization if the spiritual meaning of the story was the establishment of a personal relation between the worshipper and the genius of his household,³ for this is a revelation of God's nature to which the human heart and mind are attuned when the corporate political aspect of Religion—the worship of a deified parochial or universal state—is discredited by the collapse of the mundane society whose will to live is reflected in it.⁴ We have already noticed another fruit of Sumeric spiritual experience which had likewise been garnered by Christianity, though this without recognition of the Sumeric source. The Passion of Christ, as we have seen, had been foreshadowed in a Passion of Tammuz in which the death of one god, made manifest in the *ἐναντὸς δαίμων*,⁵ had been celebrated under the divers names of Adonis, Osiris, Attis, Zagreus, Balder, as the rite had radiated over the face of the Earth. The Queen of

to freeze itself hard in order to save itself from being liquidated by Gnostic and other alien influences (on this point, compare the passage quoted from Bishop E. W. Barnes on p. 465, below).

(iii) In the West, from the fifth century of the Christian Era onwards, the Christian Church was drawn into playing the role of serving as a chrysalis for the genesis of a new Western Christian Civilization out of the moribund body social of an old Hellenic Civilization (on this point see the present volume, pp. 392-419, above).

(iv) In the West, in the fourteenth and fifteenth centuries of the Christian Era, the Christian Church was drawn into participation in a backward-looking renaissance of the Hellenic Civilization to which the Western Christian Civilization was affiliated (on this point see the present volume, pp. 538-44, below).

The foregoing considerations are set out, under the cross-heading 'The Conservatism of the Church', in an essay on 'Christ the Constructive Revolutionary' on pp. 348-52 of a symposium entitled *The Spirit* (New York 1919, Macmillan).

Mr. Martin Wight comments: 'The conservatism of modern Christianity has another cause which is not mentioned here. As a post-Christian Western Civilization developed out of Western Christendom from the seventeenth century onwards, the Church, rightly fearing the spread of secularism and the reversion to neo-paganism, wrongly identified the Faith with the social system that was passing away. Thus, while conducting an intellectual rearguard action against "liberal", "modernist", and "scientific" errors, it incautiously fell into a posture of political Archaism, supporting feudalism, monarchy, aristocracy, "capitalism", and the *ancien régime* generally, and became the ally and often the tool of political reactionaries who were as anti-Christian as the common "revolutionary" enemy. Hence the unedifying political record of modern Christianity: in the nineteenth century it allied itself with monarchism and aristocracy in order to denounce liberal democracy; in the twentieth century it allies itself with liberal democracy in order to denounce totalitarianism. Thus it had seemed, ever since the French Revolution, [always] to be one political phase behind the times. This, of course, is the gist of the Marxist criticism of Christianity in the Modern World. The Christian answer would perhaps be that, when the Gadarene swine of a disintegrating civilization are engaged in their headlong downward rush, it may well be the Church's responsibility to keep as far as possible to the rear of the herd and direct the eyes of as many as possible backwards up the slope.'

Heaven who was the virgin mother and spouse of the dying god had been adored as Ishtar, Ashtoreth, Isis, Cybele, Britomartis, and Inanna on her way to being adored as Mary.¹ In the sacrifice of the Mass, Christians were still partaking of the sacrament of all the pagan mysteries.

The travail of Christ Incarnate for the salvation of Mankind had been foreshadowed in the labours of Gilgamesh, Hēraklēs, Prometheus, and the 'culture heroes' of a Sinic mythology,² and the Incarnation had been no stumbling-block to the imagination of an Hellenic World which had added the revolutionary worship of Caesar to a traditional worship of the Olympians. In the Olympians the mundane society that was Christianity's first mission-field was already familiar with the spectacle of divinity in human form—though, through the dark glass of a barbaric Achaean mythology, the many gods into whom the One True God's image was here diffracted showed themselves prone to all human moral infirmities and free merely from all human physical limitations.³ In Divus Augustus the potential converts of the first Christian missionaries had already acknowledged an incarnation of the Godhead in a living human being whose mortal mother was fabled to have been got with child by an immortal sire;⁴ and this divine deed, which must shock the sensibilities of a philosophic soul as a vulgar moral transgression when it was attributed to an Olympian, was to shine, in the self-revelation of a God whose power was love and whose Godhead was as wholly present in the Son as in the Father, as a voluntary evacuation (κένωσις) of His own divinity which was a supreme act of self-sacrifice for the redemption of His fallen creatures.

The tableau of Mother and Child among the gentle cattle in the stable at Bethlehem, which symbolized Christ's act of κένωσις in the imagery of the Christian Faith, had been anticipated in the tableau of a Minoan πότνια θηρῶν surrounded by her *comitatus* of beasts of the field.⁵ The lamb who had been moved to prophesy by the agony of an Egyptiac Time of Troubles had been a prototype of the lamb who was Christ;⁶ and the Sumeric fish-god Ea—incarnate in the fish whose presence had hallowed the tanks of latter-day shrines at Mambij and Ascalon⁷ and Brusa⁸—had been a prototype of the Christ whose epiphany as a fish had been ingeniously explained away as a play upon the initial letters of his style and title in Greek.⁹ The dove that became

⁹ Ἰησοῦς Χριστὸς Θεοῦ Ὑιὸς Σωτὴρ = ΙΧΘΥΣ.

the Holy Spirit descending on Jesus at His baptism in Jordan had hovered in ages past round the fane of Aphrodite as Paphos.¹ The stone² on which the Church of Christ was built had made its earliest advent to Rome, not in the first century of the Christian Era, but in 204 B.C. as the baetylus of a Pessinuntine Cybele, and the Roman Catholic Church was not the only surviving religious edifice that rested upon it; it was also embedded in the foundations of the Ka'bah at Mecca.³

Man's worship of forces of Nature, less amenable than stocks and stones, that mocked his audacious efforts to harness and exploit his fellow creatures, had given Man an inkling of the One True God's transcendent power. A sky god and a volcano *jinn* had lent their potency to quicken Israel's overwhelming sense of the omnipotence of the Living God Yahweh;⁴ and an ancestral worship of a Sun in which a maturing Scientific Mind had correctly discerned the physical source of terrestrial energy and life had initiated Constantine into the secret that God's power is the power of love⁵ when he had seen the Cross flame out athwart the Aton.⁶

In their handling of this spoil that had been carried in suspense in the current of Christianity, the traditionalists and the rationalists had played into one another's hands once again. The same historic rites and symbols that the traditionalists had defended tooth and nail, in the forms in which Christianity happened to have adopted them, as essential and inalienable elements of Christian practice and belief, had been denounced by the same Christian controversialists, with reckless inconsistency, in the unmistakably kindred forms in which they were to be found in other faiths and worships. The resemblance was indeed so striking that the Christian traditionalists had been unable to ignore it; but, instead of allowing themselves to apprehend the simple truth that it was a family likeness, they had concocted the ingenious alternative explanation that it was devil's work. The Devil and his angels had put into circulation counterfeit copies of the institutions of the Church in order to mislead Mankind into rejecting the One True Faith.

In thus branding the pagan mysteries as frauds, the Christian traditionalists had delivered themselves into the hands of their ex-Christian rationalist adversaries. The Higher Criticism could demonstrate incontrovertibly that the genetic relation between corresponding rites and symbols was the inverse of what the traditionalists alleged. So far from the pagan forms being counterfeits of the Christian, the Christian could be shown to be derivatives of the pagan; and, therewith, the Christian traditionalists were hoist with their own petard; for they themselves were unescapably 'on record' as having declared these

¹ See V. vi. 362.

² 'Stone' is the authentic meaning of the masculine Greek word *πέτρος*, not 'rock', which is the meaning of the collective feminine *πέτρα*.

³ See V. v. 685-8, and pp. 465 and 466, below.

⁴ See V. vi. 38-45.

⁵ See V. v. 691-4 and V. vi. 24-25.

⁶ This intuition that the divinity embodied in the Sun was identical with a Dead and Risen Christ enabled Constantine to fulfil Ikhnaton's unfulfilled mission of becoming the One True God's oecumenical bishop. Ikhnaton had failed to take the literally crucial step of identifying the Aton with Osiris—perhaps because a nascent Osirian Church had already been blighted by being drawn into an unholy alliance with the barefacedly political religion of Amon-Re (see I. i. 143-5).

elements of religion to be a sham and a delusion in their pagan version, and the words could be taken out of their mouths to pronounce the same judgement on their own holy of holies. On the Christians' own confession, so the neo-pagans could declare, a religion which had adopted and cherished these crude primitive rites and symbols stood convicted of having the lie in its soul.

This was a fair shot¹ in the not illegitimate warfare that the neo-pagans waged against the Christian traditionalists; and in that battle it was also a knock-out blow. From the rigorously exclusive traditionalist Christian standpoint the Higher Criticism's argument was unanswerable. Since the days of the Fathers of the Church, however, there had been other Christians who had acknowledged Christianity's pagan ancestry, and these could still hold the field and turn the argument's edge against its neo-pagan authors. In contrast to the Christian traditionalists, the Christian evolutionists² had started, not from the negative premiss that pre-Christian paganism was false, but from the positive premiss that Christianity was true; and they could therefore accept with impunity a recognition of the truth that the resemblances between Christianity and pre-Christian paganism were due to Christianity's indebtedness to a pagan past. The Christian evolutionist's inference from this would be, not that there was no truth in Christianity, but that the truth which was in Christianity had already been aglow in paganism for ages before it had burst into a Christian flame. The enlightened Christian would not only accept this new perspective without hesitation or embarrassment; he would give glory to a God who 'is' before Abraham 'was', for having revealed some glimmer of His light to Man before Abraham's day.

This was not the last word, however; for, if the Christian evolutionist was in a posture to stand his ground and to return the neo-pagan's fire after the Christian traditionalist's batteries had been silenced, he must be on guard against ranging himself under the Christian traditionalist's standard and thereby nullifying his own Christian victory. Transposing our simile of the flow of a river into terms of a simile of the radiation of light, we must be ever alert to distinguish between the eternal source of light and its transient manifestations. 'No man hath seen God at any time';³ we apprehend God's existence and divine His nature thanks to the Creator's revelation of Himself through His works;⁴ but God's

¹ Mr. Martin Wight comments: 'The reasoning of this paragraph does not carry conviction. Whatever [a] Higher Criticism can demonstrate, it has nothing to say to the question whether the pagan rites are diabolical in origin. The fact that pagan theophagy is historically and anthropologically prior to the Eucharist does not in the least affect the Christian's assertion that pagan theophagy is false while the Eucharist is the real thing. Genetic relationships are irrelevant to teleology—though, of course, most Christians today, and many Christians at all times, would say that these pagan rites were (or are) adumbrations of and preparations for the real thing rather than diabolical counterfeits. The dual interpretation of non-Christian religions either as demonic or as *praeparatio evangelica* goes back to the earliest days of the Church.'

² The word 'evolutionists' is, of course, used in the present context in its generic meaning, without any intention of importing into it the specific associations attaching to its use in hypotheses and controversies precipitated by the Modern Western science of Biology.

³ 1 John iv. 12.

⁴ Mr. Martin Wight justly comments: 'For a Christian, through Christ.' It was the Christian Faith that God had made one unique direct revelation of Himself to Mankind on Earth in the incarnation of the Second Person of the Trinity as Christ Jesus, and this Christian belief was in contradiction with the statement that has just been quoted from

works are not only windows through which the heavenly light is made visible to the eye of the Human Soul on Earth; they are at the same time veils through which the radiance is dulled to a degree at which the Soul's eye can receive it without being blinded; they are partly opaque as well as partly translucent, and they never reveal to us more than a local aspect of God's omnipresence or a temporary aspect of His eternity.¹ In the rudimentary theology of a North American Indian tribe, these elusive epiphanies of God had been described in the vivid imagery of the primitive imagination:

'Everything, as it moves, now and then, here and there, makes stops. The bird as it flies stops in one place to make its nest, and in another to rest in its flight. A man, when he goes forth, stops when he wills. So the god has stopped. The Sun, which is so bright and beautiful, is one place where he has stopped. The Moon, the stars, the winds he has been with. The trees, the animals, are all where he has stopped, and the Indian thinks of these places and sends his prayers there to reach the place where the god has stopped and to win help and a blessing.'²

This intuition that God's works are God's stopping places had been the inspiration of Goethe's greatest poem³ and Bergson's greatest philosophical work.⁴ The error of idolatry lies in mistaking the creature for the Creator, and the sin of it lies in worshipping the creature in the Creator's stead.⁵ Man has thus idolized the productive and destructive forces in Non-Human Nature—cow and bull, field and mountain, sun and storm—and the corresponding antithetical forces in Man himself: the key roles, gracious or forbidding, in the drama of human life—motherhood, fatherhood, kingship, self-sacrifice—and a Leviathan that is the appalling projection of a demonic corporate human power. Yet any veil through which God's light dimly shines is an intimation of God that is not God Himself, though one veil may differ from another in the degree of its opacity. Moreover there is veil behind veil, and the

the New Testament. Yet, if the Christian Church had apparently revoked the Johannine declaration that 'no man hath seen God at any time', a Christian would not dispute the proposition that 'no man hath seen God at any time except in "the incarnation of Our Lord Jesus Christ"': he would hold that Christ's human nature, from which His divine nature was never dissociated at any time during its direct revelation to human beings, was one of the works of the God who had incarnated Himself in this human nature as Christ Jesus; and—holding also, as he must, that 'although he be God and man, yet He is not two, but one Christ'—he must hold Christ to be 'inferior to the Father as touching His manhood' while 'equal to the Father as touching His Godhead'. Thus, according to the Christian Faith, God, in Christ incarnate, had revealed Himself 'in association with' one of His works, though not in this case solely 'through' it, since, according to the Christian Faith, this unique revelation was a direct self-revelation of the Godhead.

¹ This is T. S. Eliot's theme in *The Rock*, Chorus X, beginning 'O Light Invisible, we praise Thee! Too bright for mortal vision', with its refrains in the words of the liturgy of the Holy Communion, and with its conclusion:

'And when we have built an altar to the Invisible Light, we may set thereon the little lights for which our bodily vision is made,

'And we thank Thee that darkness reminds us of light.

'O Light Invisible, we give Thee thanks for Thy great glory.'

² Quoted by Fletcher, A. C., in *Reports of the Peabody Museum of American Archaeology and Ethnology*, vol. iii, 1880-6 (Cambridge, Mass. 1887, Peabody Museum), p. 276, n. 1.

³ For this theme in Faust, see II. i. 271-98.

⁴ Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan).

⁵ See IV. iv. 261-2.

Soul's approach on Earth towards the Beatific Vision and the Communion of Saints is made by stripping away one revealing-obscuring veil after another, as far as Man's spiritual insight can penetrate and as fast as his Soul's eye can accustom itself to the increase in the degree of the radiance that the removal of each successive veil brings with it.¹ A veil between the Human Soul and God is removed when the creature in which this veil consists is mastered—and, in the act of being mastered, is exorcised—by the Human Intellect; and this is why 'the discovery of new means by which Consciousness is enabled to extend its range of objectives has always been the decisive factor in the history of human development'.²

This is the way of Life; but it is a hard way, because the stepping-stones are stopping-places and the pilgrim's progress is a *tour de force*. The Soul in search of God has 'to make a movement out of something which, by definition, is a halt',³ and she has to see through the ambivalence of windows that are veils. Each veil becomes suffused with light in the act of obstructing the light's passage from its source to the eye. How can we believe that this rose-flushed or that opal-tinted cloud owes its glow and colour to a glory that is not in, but is beyond, the cloud itself? And, even if our minds do become convinced of the truth of this hardly credible proposition, how can our hearts bear to discard a thing of beauty that has been a joy, and at which we have learnt to gaze without being dazzled? Can it not be a joy for ever? Is it not sacrilege to discard it? Is it not madness? Man is prone to idolatry because he is always tempted to play truant from his God-given task of a never-ending search for God by seeking rest in a finite object of worship, and this, in the imagery of a seventeenth-century English poet, was the reason why God 'made a stay' in pouring his blessings on Man when rest alone remained to bestow upon him.

For if I should (said he)
Bestow this jewel also on my creature
He would adore My gifts instead of Me,
And rest in Nature, not the God of Nature;
So both should losers be.⁴

Here is the crux in the way of Man's approach to God; and, because of it, each spiritual step in advance has to be paid for, like all true gains, by a painful sacrifice. We have to throw away a treasure of the highest value so far known to us in order to purchase another treasure whose value, before we have grasped it, we can only take on faith as being higher still.⁵ This Pilgrim's Progress requires an ascetic ruthlessness as

¹ Mr. Martin Wight comments: 'This is the Christian's answer to your assertion above, on pp. 442-3, of the spiritual equivalence of the four higher religions: "God, who at sundry times and in divers manners spake in time past . . . by the Prophets [and by the pagan precursors], hath in these last days spoken unto us by His Son" (Heb. i. 1-2).'

² Baynes, H. G.: *Mythology of the Soul* (London 1940, Baillière, Tindall, & Cox; 1949, Methuen), p. 309. The quotations from this book have been made with the permission of the publishers.

³ Bergson, op. cit., p. 251, quoted in III. iii. 235.

⁴ Herbert, George: *The Pilgrimage*.

⁵ 'This is moving and, from the Christian point of view, true. It is the demand which God made on Abraham when He called him to abandon the "other gods" whom his

well as a sanguine hope and valour; and faint souls that flinch from the ordeal seek to justify their failure to themselves by enlarging on the negative aspect of the spiritual feat that is demanded of them, and closing their eyes to the spiritual gain of which this sacrifice is the inexorable price.

'Prometheus, the cultural innovator who stole the fire of the Gods, is the prototype for all time of the daring hero-criminal who challenges the primordial images, the immemorial gods of the Unconscious, in order to place more power—i.e. knowledge—in the hands of Consciousness. . . . The guilt of Prometheus (which is also the guilt of the psychological innovator and pioneer) consists in the fact that he transferred from Heaven (i.e. the realm of primordial images) energy which had been latent in the Unconscious since the World began, bringing it under the control of Consciousness.'¹

Hence the paradox that some of the greatest advances in the Soul's approach to God that have been made, at divers times and places, by saints and seers, have been anathematized as appalling backslidings—and this in good faith—by men of common clay who could not 'make the grade'. An Hellenically cultivated Pompey was dumbfounded at finding no material object of worship whatsoever inside the Holy of Holies of the Temple of Yahweh at Jerusalem when he forced his way in under the stimulus of a curiosity that had been whetted by the provocative self-confidence of a Jewish community's claim to be the only rightly guided worshippers of the One True God. In the next age of Hellenic history a now rather more pious pagan public discovered to its horror that the harmless-looking adherents of a new sect called Christians were 'atheists' who rejected everything that their pagan neighbours held sacred,² while pious Jews, for their part, execrated the Christians as libertines who had betrayed the faith of their fathers by admitting Gentiles into religious communion with Christian Jews and by exempting these uncircumcised proselytes from the duty of observing the Mosaic Law.

This was the historical background against which students of history midway through the twentieth century of the Christian Era had to view the state of Christianity and the other living higher religions in their day; and the conclusion to be drawn seemed to be in sharp contradiction with both the rationalist and the traditionalist position. The flotsam scoured out from older strata of religious experience and carried along in suspense in a Christian, Mahayanian, Hindu, or Islamic stream was no evidence that the water with which it was mingled was not the true living water from Heaven; but the water was given a clean bill of health in virtue of the finding that its load of fertilizing mud was only a temporary accretion; and this finding, which disposed of the rationalist's indictment of the muddiness of the stream, was at the same time fatal to the traditionalist's defence of it on the ground that the mud was of the

father Terah served (Joshua xxiv. 2); on Saul before he could become Paul; and on Augustine; and it is the demand which is made, in principle, on the adherent of every other higher (and lower) religion.'—Martin Wight.

¹ Baynes, *op. cit.*, pp. 310 and 316.

² See V. vi. 536, and p. 491, below.

water's essence. The waters dropped by the Monsoon could not have become the Nile without scooping up the Abyssinian silt and carrying it along with them; but it was equally true, and true for the same reason, that the Nile could not be what it was without depositing its load sooner or later and eventually flowing out to sea in a stream as pure as the rain that had originally fallen from Heaven.

A Christian Father, Justin Martyr, writing his *First Apology* in the second century of the Christian Era, had not shrunk from pressing his argument against his pagan adversaries by drawing attention to a parallelism between the virgin births ascribed to Jesus and to Perseus, between the miracles of healing ascribed to Jesus and to Aesculapius, and between the alleged resurrection of Jesus and the apotheosis of Ariadne and the Caesars;¹ and the illuminatingly charitable distinction between the essence of a religious revelation and the accidents of the time and place in which it has come into the World, which a Christian 'evolutionist' might have derived from the polemical argument of a Christian 'fundamentalist', had been drawn by an eminent Modern Western Islamic scholar in an appreciation of the character and career of the Prophet Muhammad.

'Certainly Muhammad was guilty of errors, some of which were involuntary, but others not; besides these, he also perpetrated not a few acts that would be classified by us to-day as common crimes inspired by the basest of human passions; but it will be the task of future generations of historical critics to elucidate how far, in all this, the Prophet's personal responsibility is engaged, and to what extent his acts are, on the contrary, to be regarded as being an impersonal expression of the specific conditions of a society that was still in a primitive stage of development. Our own belief is that the errors and defects discernible in the Prophet, and in the religious system that he created, are to be attributed to the society in which he lived. To this society Muhammad was superior in many respects, but in others he was its native child and, as such, was necessarily a party to all its vices, imperfections and prejudices.'²

The Prophet Muhammad, as we have seen,³ did deliberately compound with a pre-Islamic Arabian paganism, when he consented to adulterate the purity of his 'Religion of Abraham' by alloying it with the

¹ Justin Martyr's standpoint is described by Mr. Martin Wight as follows: 'Justin was the reverse of an "evolutionist"; he was an exclusivist or universalist, believing that the Christian Revelation is exclusively true and makes demands on the entire Human Race. He believed in the demonic character of pagan religion, especially where it imitated the Christian mysteries: see his discussion of the Mithraic mysteries as a diabolical travesty of the Eucharist, *Dialogus cum Tryphone*, ch. 70, and *First Apology*, ch. 66. In the passage that you cite he is not drawing parallels between Christian and pagan miracles; he is arguing with polemical irony: Who are you pagans to sneer at our belief in a virgin birth—what about Perseus? Or to find the miracles of healing incredible—what about Aesculapius? Or to find the Resurrection and Ascension ridiculous—"we propound nothing different from what you believe about those whom you consider to be the sons of Zeus . . . [and], the emperors . . . whom you deem worthy of deification, and on whose behalf you produce somebody to swear that he has seen the burning Caesar ascend to Heaven from the pyre" (*First Apology*, ch. 21). Justin makes the natural and reasonable assumption—for a Christian—that, in so far as pagan myths are true, they foreshadowed and find their fulfilment in Christ, but that, in so far as they described gods who are engaged in every kind of crime and vice, they are the work of the Devil.'

² Caetani, L.: *Studi di Storia Orientale*, vol. iii (Milan 1914, Hoepli), p. 295.

³ On pp. 437-8, above.

local cult of the Black Stone embedded in the wall of the Ka'bah at Mecca and with the regional practice of an annual pilgrimage to this Hijāzī shrine.¹ Yet this conciliatory concession to the prejudices and interests of his stiff-necked clansmen the Banu Quraysh was a venial sin against the Prophet's own Heaven-sent lights which left untarnished the sincerity and strength of will which Muhammad consistently displayed in resisting a perpetual temptation to compromise with the two mortal sins of Polytheism and Idolatry that were rampant not only in the Arabian paganism but also in the Hellenic Christianity of Muhammad's day; and in Christianity likewise, in spite of all the Christian Church's lamentable shortcomings and backslidings, there had always been a tendency for the living waters to defend their purity by refusing to pick up and carry the sullyng soil that they had found in their path.

'The temptation to form tacit alliances with other religious movements, in some ways remarkably similar, must have been strong. Such an alliance would, however, have meant the ultimate repudiation of all that was most characteristic in the teaching of Jesus. Because Christianity refused compromise with other faiths, it survived to become, until practically our own time, the nominal, and not wholly ineffective, religion of Europe. Whether, by re-affirming the teaching of Jesus in its undeviating severity, Christianity can resume its hold on the hearts and minds of men, is a question of great importance as regards the ultimate fate of European Civilisation.'²

How were souls in search of God to disengage the essence of Religion from the accidents? Doubtless Time would show; for the expectation of human life on Earth (supposing that Man did not use his swiftly increasing technological command over Physical Nature to annihilate himself) was unimaginably long, and, in the course of those future aeons, the living waters would assuredly have time to purify themselves, like the Nile in its vastly briefer passage from Lake Tana to the sea. Time would show; but, in the life of the Spirit, operations are never impersonal or automatic; and, if this salutary purification were indeed eventually to be accomplished, this would be the achievement of individual souls. At any moment in its personal pilgrimage through life on Earth, a soul might be challenged by God to discriminate between the silt and the water, between the light and its reflection, by trial and error at the Soul's own peril; 'and narrow is the way which leadeth unto Life, and few there be that find it',³ for, on the spiritual even more conspicuously than on the physical plane, it is impossible to live without living dangerously.

(c) THE CONFLICT BETWEEN HEART AND HEAD

Essence and Accidents

How, in an *Oikoumenē* that was being united on a literally world-wide range within a Western framework, were Christians, Buddhists, Muslims, and Hindus to make further progress in disengaging the essence of Religion from the accidents? The only way open to these fellow seekers after spiritual light was the hard road of spiritual travail along which

¹ See p. 466, below.

³ Matt. vii. 14.

their predecessors, with God's help, had arrived at the degree of religious enlightenment represented by the living higher religions at the stage in which they found themselves at this crucial moment in Mankind's history. By comparison with the stage embodied in Primitive Paganism, the state of relative enlightenment to which the adherents of the higher religions had attained by a date midway through the twentieth century of the Christian Era manifestly represented a marvellous spiritual advance; yet, marvellous though it might be, they had now become aware that they could no longer go on living parasitically on God's past mercies to their forefathers and on their own forefathers' past spiritual endeavours to win a fuller vision of God, and a closer communion with Him, for themselves and for their children. They knew that they could no longer rest on their predecessors' spiritual labours because, in their generation, they were being racked by a conflict between heart and head which they could not leave unresolved with impunity, and which could be resolved only by a fresh spiritual move forward.

As the pilgrims girded themselves to take the hard road again, they might draw some encouragement from divers past successes of Mankind in discarding veils which had served as windows in their time. In default of fuller light, there had been a glimmer of spiritual enlightenment in the faint translucency of Man's vision of God through the animal creation.¹ In the demonic physical energies of untamed wild beasts Man had caught a glimpse of a divine power surpassing Man's own strength; in the hunter's game and in the shepherd's flock he had caught a glimpse of God's beneficence as the giver and sustainer of life; and a primitive worship of God in animal form had lived on to play a leading role in the religion of the Egyptian Civilization. Yet, in the World as it was in A.D. 1952, this dim 'theriomorphic' vision of God, though still a living reality for unsophisticated souls at the lower levels of Hinduism, was on the whole on the wane. In the Christian consciousness the lamb, the dove, and the fish stood, not for literal likenesses of God, but for poetic images of His ineffable nature—just as the rock on which the Church was built according to the Roman Catholic Christian belief was not a literal stone like the stone that had once embodied the Emesan divinity Elagabalus or the stone that still supported the wall of a Meccan Ka'bah.

There were, however, some relics of past stages of enlightenment which might not prove so easy to purge away. The Muslims, who had resolutely rejected all visual representations of God in the physical likeness of living creatures, including 'the human form divine', had not yet summoned up the resolution to break with that older and cruder phase of idolatry which had been embedded in Islam by the founder Muhammad himself—against the grain of his own prophetic mission—when he had given his sanction to the adoration of the Black Stone as part of a compromise with the vested interests of an *ancien régime* at Mecca.² Even the puritanical Wahhābī reformers, who had twice entered Mecca

¹ See p. 461, above.

² This perhaps trivial but hitherto indelible blemish upon the purity of Islam has been noticed on pp. 464–5, above.

as conquerors pledged to purge Islam of idolatrous accretions, had left the Black Stone untouched both in A.D. 1804 and in A.D. 1924. To Christian minds the Muslims' reluctance to part with the Black Stone seemed a quaint anachronism in glaring contradiction with the abhorrence of idolatry and devotion to monotheism that were the twin beacon-lights of Islam; and, conversely, Muslim minds found stumbling-blocks in the idolatry and the polytheism which, as they saw it, were still being practised by Christians, as well as by Buddhists and Hindus. In Muslim eyes the Christians' persistent idolatry betrayed itself in the visual representation of God in the forms of a man, a bird, and an animal, and their persistent polytheism in their doctrine of the Trinity and their cults of the saints, while in a Protestant Christian's eyes the sacrament of the pagan mysteries survived in the Catholic 'Sacrifice of the Mass', and the worship of the Great Mother had been withdrawn from Ishtar, Astarte, Isis, Cybele, and Inanna only to be paid, by Catholic devotees, to the same Mother of God under the name of Mary.¹

Of all the veils through which the vision of God had been transmitted and at the same time obscured, the hardest for Muslims as well as for Hindus, Christians, and Buddhists to discard would be their representation of God to themselves in the likeness of Man.

It might be true that the corporeal version of 'anthropomorphism' was as obsolete as 'theriomorphism' and fetish-worship. The vision of divinity incarnate in the physical likeness of men and women of flesh and blood—a vision that had found its most attractive expression in Hellenic poetry and art—was not accepted by the adherents of any of the higher religions as a revelation of the ultimate nature of God. In terms of Christian theology the incarnation of God in Jesus Christ had been an 'emptying' (*κένωσις*)² of God's own ultimate nature; and God's voluntary act of thus 'emptying' Himself in order to be born a man had been God's supreme self-humiliation and self-sacrifice for Man's sake—a sacrifice entailing but transcending the death on the Cross through which God Incarnate had fulfilled His Mission on Earth. Yet, when Christians sought to know God, their conception of God was still 'anthropomorphic' in being in terms of the feelings, will, and intellect of a human personality—in terms, that is, of elements of conscious human psychic life which they had never encountered at first hand except in association with human bodies. And, when Hindus sought to know God, they eliminated from their conception of God both the physical body and the conscious surface of the Psyche, only, it would seem, to identify deity (*brahman*) with the impersonal subconscious psychic depths (*ātman*) that underlie the personal conscious surface of a human soul.³ This psychic anthropomorphism was perhaps one of the inescapable limitations of Human Nature, since human beings were

¹ See pp. 437 and 457, above, and p. 717, below. Catholic Christians, of course, did not admit the Protestant allegation that their adoration of Mary amounted to the worship of a goddess. According to the Catholic Christian doctrine, Mary was one of God's creatures, and the qualities that Catholics adored in her were gifts to her from her Creator.

² Phil. ii. 7 (R.V.).

³ See pp. 497–8 and 725, with n. 1, below.

incapable of conceiving of God's nature except in images drawn from, and therefore inevitably bounded by, human experience. Yet a necessary limitation might be a potential source of errors into which the Human Spirit need not fall and into which it could not allow itself to fall with impunity.

One of Man's fundamental and perennial errors—an error that is both an intellectual and a moral lapse—is to idolize discoveries of his own making that enhance his power. About half-way through the last millennium B.C., Indic minds had discovered the Subconscious Psyche and Hellenic minds the Reason, and their idolization of these discoveries had been taken over, and carried along down-stream, by Hinduism and Christianity respectively. In the twentieth century of the Christian Era, Western minds, by an experimental method of scientific inquiry which they had forged for themselves in a Modern Age of Western history, had arrived independently at that discovery of the Subconscious which Indic minds had attained by intuition some 2,500 years earlier; and in the year A.D. 1952 a student of History might guess that the Western World, after having followed an Hellenic philosophy hitherto in worshipping a false 'God the Reason', would now veer about and follow an Indic philosophy in worshipping an equally false 'God the Subconscious'. This nascent new religion of the West had been portended in Mr. Aldous Huxley's exposition of a 'Perennial Philosophy',¹ and it was assuredly salutary for Western thinkers to recognize that the Anaxagorean deification of human intelligence, like the Homeric deification of human flesh and blood, was an inadequate representation of the Godhead, and that Indic sages had made momentous discoveries in the spiritual sphere to which Hellenic philosophers and Western scientists had been blind. The mistake that an unnerved Western rationalist might be in danger of making would lie in overlooking the truth that, in identifying the human subconscious psyche with God, the Indic sages had fallen into the same 'perennial error' as the Hellenes who had found God in the human reason or in the human body.

The truth is that Anthropomorphism, even in its most ethereal expressions, is a form of idolatry if idolatry is to be defined as a worship of the creature instead of the Creator;² and this worship of God in the image of Man—unlike the worship of God in an animal or in a stone—is also vitiated by the intellectual error and moral failing of 'the egocentric illusion'. At an earlier point in this Study³ we have observed how this illusion had tempted the representatives of parochial and ephemeral secular societies to imagine that their own particular civilization, in the particular phase in which it had happened to find itself in their day, was the consummation of human history. The same illusion can be detected in Man's anthropomorphic conception of God; and the fallacy in it has been exposed with a devastating finality, apropos of this far

¹ Huxley, A.: *The Perennial Philosophy* (London 1946, Chatto & Windus).

² For this definition, see IV. iv. 261-2. A Christian, of course, would maintain that he was not worshipping a creature in worshipping Christ Jesus, for he would say that in Christ he was worshipping God and not the human nature in which God was incarnate and in which the Christian would see one of God's works of creation.

³ In I. i. 158-64.

more momentous issue, in the satirical verse of the Hellenic philosopher Xenophanes:

'The Aethiopians say that their Gods are snub-nosed and black-skinned, and the Thracians that theirs are blue-eyed and red-haired. If only oxen and horses had hands and wanted to draw with their hands or to make the works of art that men make, then horses would draw the figures of their Gods like horses, and oxen like oxen, and would make their bodies on the model of their own.'¹

There is, no doubt, a sense in which it is true that 'God created Man in His own image'²—though in the same sense this is also true in some measure of each of God's other works of creation, since all are windows that reveal their Creator, besides being veils that conceal Him—but, when Man is tempted by his awareness of his own God-given likeness to his Maker into setting himself up as the measure of all things,³ including the God whose image is dimly revealed through the dark glass of Human Nature,⁴ Man can be acquitted of the sin of *hybris* only on the plea that he labours under an invincible ineptitude. In his continuing search for God, Man is called upon to transcend Anthropomorphism; but, in attempting to respond to this challenge from his Maker, Man is confronted by a crux inherent in the paradoxical ambivalence of Human Nature.

Anthropomorphism seems likely to be harder for Man to transcend than any other form of idolatry because Man is the highest of God's creatures that is known to Man, and therefore, in so far as our knowledge of God Himself is derived from our knowledge of His creation, the image of God that is presented by Man is the least opaque fragment of the glass through which we see God darkly.⁵ Yet, in the act of becoming aware of his position at what appears to be the apex of God's creation, Man is caught between Scylla and Charybdis. He is lost if the relative sublimity of his station turns his head; for, when he allows himself to be overcome by the dizziness of pride, he falls crashing down from his pinnacle; and, in his exposure to this danger, he is less happily placed than his humble servant the dog, who is immune against the sin of pride thanks to an overwhelming awareness of his own inferiority to the mysterious fellow creature that has domesticated him. Yet Man's undoglike capacity to fall is a measure of the height on which God has set him; for Man is the highest of God's creatures known to Man in virtue of his knowledge of good and evil and of his power to choose between them; and he is the best of God's creatures because it is in his

¹ For the original Greek text of this passage, which has been quoted already at the head of the opening chapter of this Study, see I. i. 1, n. 1.

² Gen. i. 27.

³ The dictum is ascribed to the Hellenic philosopher Protagoras.

⁴ This temptation is likely to be particularly insidious in its attack on human souls which believe that God has created in His own image Man alone among all His works; and Mr. Martin Wight points out that this is the traditional Christian doctrine. 'God's creation of Man in His own image means that God created Man with a rational faculty which can reciprocate God's love and with an immortal soul which can be freely dedicated to God's glory; and here is the specific difference between Man and God's other works of creation. These are His handiwork and to that extent "reveal" Him; they are not in any sense "in His image".'

⁵ 1 Cor. xiii. 12. See p. 467, above.

power to be the worst, as well as the best, of them all. This moral faculty is the distinctive feature of Human Nature that makes it a less imperfect image of the Godhead than any other of the works of God. Man's farthest reach in his effort to comprehend God's nature is to attribute to his Creator the moral power with which Man himself is conscious of being endowed; but, in reaching this limit of his powers of comprehension, Man becomes aware of the infinity of the distance by which he still falls short of his spiritual goal; and, whether this crushing experience moves him to humble himself like Job, or to sneer like Mephistopheles, or to hover between the two moods like Pope, he will acknowledge the truth of the words that are put into God's mouth by Deutero-Isaiah:

'My thoughts are not your thoughts, neither are your ways My ways, saith the Lord. For, as the Heavens are higher than the Earth, so are My ways higher than your ways, and My thoughts than your thoughts.'¹

This was the challenge that confronted the followers of the historic higher religions in a world in which they had suddenly been brought to close quarters with one another and with a Modern Western Science owing to the rapid spread of a secularized Western Civilization over the whole habitable and traversable surface of the planet. In the year A.D. 1952 the living generation of Mankind did not yet know how they were going to negotiate this next stage of their present 'climbers' pitch';² still less did they know whether they would succeed in scaling it; but they could see that they stood no chance of succeeding unless they could settle their latter-day conflict between Heart and Head, and that therefore a sincere and earnest attempt to recapture a lost spiritual harmony was an indispensable prelude to grappling with the formidable precipice that towered above them.

The Origin of the Conflict

In order to settle a conflict, one must understand how it has arisen, and fortunately the origin of the current conflict between Heart and Head was not obscure. It had been precipitated by the impact of a Modern Western Science on Christianity and the other living higher religions; and this impact had resulted in conflict because it had overtaken the religions at a stage in their course at which they were still carrying along with them, suspended in their rolling stream, the silt that they had picked up in the process of scouring their channels out of the flanks of the archaic mountains on which their head-waters had been discharged by the rain-laden Monsoon.

This was not the first instance of an encounter between Religion and Rationalism that was known to History. At least two previous instances were on record. To recall first the more recent of the two, we may remind ourselves that the four living higher religions had each encountered—and each in this instance succeeded in coming to terms with—an older version of Rationalism in an earlier chapter of each religion's history. The now orthodox theology of each of them had been the

¹ Isa. lv. 8-9.

² For this simile, see II. i. 192-4.

product of an accommodation with an established secular philosophy which the rising religion had found itself unable to reject, or even to ignore, because this school of thought had governed the mental climate, and had commanded the intellectual allegiance, of a cultivated minority in the society that had at that time been the church's mission field. Christian and Islamic theology was a presentation of Christianity and Islam in terms of Hellenic philosophy, and Hindu theology was a presentation of Hinduism in terms of Indic philosophy, while the Mahāyāna was a particular school of Indic philosophy which had exempted itself from the ungrateful task of having to give an intellectual veneer to a parvenue religion by the master-stroke of transforming itself into a religion with a popular appeal, without ceasing to be an esoteric philosophy as well. That was not, however, the first chapter in this story; for the philosophies that were already hard-set static systems of ideas by the time when the rising higher religions had to reckon with them had once been dynamic intellectual movements; and in this youthful stage of life and growth—which was comparable to the growth-stage of a Modern Western Science since its birth in the seventeenth century of the Christian Era—the Hellenic and Indic philosophies had had encounters with the pagan religions which the Hellenic and Indic civilizations had inherited from Primitive Man.¹ There had been a similar encounter between a primitive paganism and a philosophical enlightenment in the Sinic World in a corresponding phase of Sinic history.

At first sight it might look as if these two precedents were reassuring. If Mankind had survived two past encounters between Religion and Rationalism, was not that a good augury for the outcome of a current spiritual conflict? The answer was that in the first of these two previous encounters the current problem had not arisen, while in the second encounter, in which it had arisen, the problem had received an apparent solution which had been so efficacious in keeping the peace in its own time and place that it had survived to become the crux of the problem confronting a twentieth-century Westernizing World.

In the encounter between a dawning philosophy and a traditional paganism there had been no problem of reconciling Heart and Head because there had been no common ground on which the two organs could have come into collision. The pith of Primitive Religion is not belief but action, and the test of conformity is not assent to a theological creed but participation in ritual performances. For the vast majority of the faithful, the correct and alert execution of their ritual duties is the alpha and omega of Religion; primitive religious practice is an end in itself, and it does not occur to the practitioners to look, beyond the rites which they perform, for a truth which these rites convey. The truth is that the rites have no meaning beyond the practical effect which their correct execution is believed to have upon the human performers'

¹ This primitive religious heritage had come to the Hellenic and Indic civilizations through Achaean and Aryan barbarians who had broken into the domains of the antecedent Minoan Civilization and Indus Culture, to which the Hellenic and Indic civilizations were respectively affiliated (see Table IV folding out opposite p. 772, below).

social and physical environment. The so-called 'aetiological myths', which purport to explain a traditional practice's historical origin, are not taken as statements concerning matter of fact that can be labelled 'true' or 'false'; they are taken in the spirit in which, in a more sophisticated state of society, a child takes a fairy-story or a grown-up person takes poetry. Accordingly, when, in this primitive religious setting, philosophers arise who do set out to make a chart of Man's environment in intellectual terms to which the labels 'true' and 'false' apply, no collision occurs so long as the philosopher continues to carry out his hereditary religious duties—and there can be nothing in his philosophy to inhibit him from doing this, because there is nothing in the traditional rites that could be incompatible with any philosophy.

Awkward situations do, no doubt, occasionally arise, as when, in a ritually conservative Athens, the intellectually adventurous Ionian philosopher Anaxagoras of Clazomenae (*vivebat* 500–428 B.C.) got into trouble for having made public his opinion that the heavenly bodies were not living gods but inanimate material objects. A more celebrated case was the prosecution, conviction, and judicial murder of Socrates by his Athenian fellow countrymen in 399 B.C. on three charges,¹ of which the second was that Socrates did not pay due worship to the gods who were the official objects of worship at Athens,² and the third was that he paid worship to other divinities who were strange gods.³ Yet it may be doubted whether legal proceedings involving Anaxagoras would have been taken, some twenty years after the Clazomenian philosopher had ceased to reside in Athens, if these had not served the current political purpose of 'smeared' Pericles; and it may equally be doubted whether Socrates would have suffered the death-penalty that Anaxagoras escaped if Socrates' attitude towards religion had been all that his enemies had had against him. Socrates was—and remained to the last—a scrupulous performer of his ritual duties; and, on the religious counts, Aristophanes' malicious caricature of him in *The Clouds* might have remained the limit of the penalty exacted from him, if he had not also been under fire in 399 B.C. on another count—the political charge of 'corrupting the young'—which, significantly, figured first in the indictment. Socrates was the victim, not so much of conservative Athenian religious fanaticism,⁴ as of democratic Athenian resentment over the final defeat of Athens in the long-drawn-out Atheno-Peloponnesian war and democratic Athenian vindictiveness towards a fascist-minded Athenian minority who had seized the opportunity opened to them by the discrediting of the democratic régime through military defeat in order to overthrow the democratic constitution. Socrates' past personal association with Critias, the moving spirit among 'the Thirty Tyrants', was the offence that the restored democratic régime could neither forget nor forgive. It was Politics, not Religion, that cost Socrates his life.

¹ Plato: *Apologia Socratis*, 24 B.

² Θεοὺς οὓς ἡ πόλις νομίζει οὐ νομίζοντα (Plato, loc. cit.).

³ ἕτερα δὲ δαιμόνια καίνα (Plato, loc. cit.).

⁴ The part played by 'Zealotism' in the prosecutions at Athens, during and after the Great Atheno-Peloponnesian War, of Anaxagoras (? *in absentia* and not *nominatim*), Aspasia, Protagoras, Diagoras, Alcibiades, and Socrates is discussed in IX. viii. 581, n. 3.

Where the issue was not confused, as it was in Socrates' case, by political animus, Philosophy and Primitive Religion encountered one another without colliding. The death of Socrates was an exception to a rule of which the life of Confucius was a classical example. Confucius reconciled a conservative reverence for the traditional rites of primitive Sinic religion with a new moral philosophy of his own making by presenting his personal ideas as the meaning which the rites had been intended to convey. Fortunately for himself, Confucius found no Sinic Critias to be his political pupil in his own lifetime; and—thanks to this failure, which was the great disappointment of his life—he died peacefully in his bed. Confucius's attitude and experience were characteristic of the normal relations between Philosophy and Primitive Religion; but a new situation arose when the higher religions came on the scene.

The higher religions did, indeed, sweep up and carry along with them a heavy freight of traditional rites that happened to be current in the religious milieux in which the new faiths made their first appearance; but this religious flotsam was not, of course, their essence. The distinctive new feature of the higher religions was that they based their claim to allegiance, and their test of conformity, on personal revelations received by their prophets;¹ and these deliveries of the prophets were presented, like the propositions of the philosophers, as statements of fact, to be labelled either 'true' or 'false'. Therewith, Truth became a disputed mental territory; for thenceforward there were two independent authorities—on the one hand prophetic Revelation and on the other hand philosophical or scientific Reason—each of which claimed sovereign jurisdiction over the Intellect's whole field of action; and, when once the hypothesis that the spheres of Revelation and Reason were even partially coincident had been accepted—and both parties did accept this as axiomatic—it became impossible for Reason and Revelation to live and let live on the auspicious precedent of the amicable symbiosis of Reason and Ritual. 'There is a peculiar agony in the paradox that Truth has two forms, each of them indisputable, yet each antagonistic to the other.'² In this new and excruciating situation, there were only two alternative possibilities. Either the two rival exponents of a supposedly one and indivisible Truth must convert their rivalry into a partnership by agreeing that their expositions were mutually consistent, or, finding themselves unable to agree, they must decide the ownership of an apparently unpartitionable disputed territory in an ordeal by battle that would have to be fought out until one or other party had been driven right off the field.

In the encounter between Hellenic and Indic philosophy and Christian, Islamic, Buddhist, and Hindu revelation, the parties did manage to arrive at a peaceful accommodation in which Philosophy tacitly consented to suspend the exercise of rational criticism against the

¹ This was true in some degree—in practice even if not in theory—of the 'Indistic' higher religions as well as the 'Judaistic'. *Ipse dixit* came to be a criterion of truth, not only for the followers of Jesus and Muhammad, but also for the followers of Siddhārtha Gautama and of the philosophic prophets of a post-Buddhaic Hinduism.

² Gosse, E.: *Father and Son*, chap. 5.

deliveries of Revelation in exchange for being allowed to reformulate the prophets' message in the sophists' language.¹

'The reception of the philosophical theology of the Greeks into the Church, so far as it was commensurable with Christianity, and the development of a Christian theology and dogma did not serve only apologetic purposes. The Greek mind was either not able to adapt the Christian faith in another way, or at least this was the specifically Hellenic way of adapting it to their culture. Nothing is so characteristic of the Greeks, says Saint Gregory of Nyssa, one of the outstanding Christian Platonists of the fourth century, as the belief that the essence of Religion lies in the dogma.'²

We need not doubt that this compromise was made in good faith on both sides, but we can see clearly in retrospect that it was not based on any genuine solution of the problem of what the relation is between Truth in the scientific sense and Truth in the prophetic usage of the word. The would-be reconciliation of the two kinds of Truth in terms of a new mental discipline called Theology was no more than verbal, and the formulae that were consecrated in the creeds were doomed to prove impermanent³ because they left the equivocal meaning of Truth still as ambiguous as they had found it. Thus a problem which had first come

¹ As the writer saw it, the achievement of this verbal accommodation accounted for the historical fact, to which Mr. Martin Wight draws attention, that Early Christianity quarrelled with Hellenic philosophy, not 'because of its implicit rationalism, but because of its pagan religious overtones, which culminated when Julian turned Neoplatonism into a pagan substitute for Catholic Christianity'. The writer agreed with Mr. Wight's contention that 'the first seven centuries of Christian history were a contest, not between Reason and Revelation, but between Paganism and Revelation', but he would account for this by submitting that, from the beginning, there had been a latent conflict which had been suppressed without being genuinely resolved and therefore without being permanently eliminated; and, in his eyes, this would be the historical explanation of the fact, pointed out by Mr. Wight, that 'the contest between Reason—in the sense of an emancipated sovereign Reason—and Revelation grew up within the bosom of Christendom. There are hints of it in the histories of Erigena and Abelard, and then it burst forth in the débacle of Christendom with Giordano Bruno, Bacon, Descartes and Hobbes.' The writer of this Study would not dissent from this, but he would agree only on grounds different from Mr. Wight's with Mr. Wight's thesis that 'this Modern Reason seems to be a very particular historical phenomenon: it is only dimly prefigured in the Ionians; its tone of authority and its universalist claims are something quite new, and they betray their origin—it is in fact (like its identical twin-brother Science and its half-brother, by a Jewish mother, Marxism) one of the parricidal offspring of Christianity'. The writer of this Study would agree that a post-Christian Western rationalism had inherited from Christianity a Judaic fanaticism and intolerance in its feelings and its conduct towards its adversaries, but he would not agree that there was any intrinsic difference on the intellectual plane between an uncompromising post-Christian Western rationalism and a pre-Christian Hellenic rationalism which had eventually betrayed its own principles by negotiating a verbal compromise with Christianity. As he saw it, it was in the nature of Rationalism, at all times and places, to follow the argument whithersoever it might lead, without being willing to allow its pursuit of intellectual truth to be arrested by any non-intellectual considerations.

² Jaeger, W.: *Humanism and Theology* (Milwaukee 1943, Marquette University Press), p. 60, citing *Gregorii Nysseni Opera*, edited by Jaeger, W., vol. ii (Berlin 1922, Weidmann), p. 271, 19.

³ Mr. Martin Wight comments: 'By "impermanent", do you mean "not universally accepted"? That, of course, they are and probably always will be. But their *permanence* seems to be one of the most remarkable things in the history of the Human Intellect: they are still recited, with whatever differences of superstition or incomprehension, by perhaps a quarter of the Human Race, and the churches have never thought that the basic work of hammering out these formulae needs to be re-done or even revised.' If this was the churches' view, the writer's expectation was that it was likely to be proved untenable in the event.

to light when the now extinct Hellenic and Indic civilizations in their decline had encountered the now still living higher religions in their rise, had been passed on, unsolved, to confront a Westernizing World in the twentieth century of the Christian Era; and this legacy bequeathed to the then living generation by its predecessors was a grievous one. Those predecessors had not only failed to find an intellectual and emotional solution of the problem for themselves;¹ the verbal accommodation which they had handed down to Posterity had made it harder for souls born in a later generation to solve the problem, now that they, in their turn, were faced with it, than it would have been for them if their predecessors had shirked the issue and had refrained from meddling.

The true solution could not be found until it had been recognized that the same word Truth, when used by the philosophers and men of science and when used by the prophets, does not refer to the same realities, but is a homonym for two different forms of experience. Scientific truth and prophetic truth are experiences on different planes, as are scientific truth and ritual observance.

'What kind of a truth is it . . . which is revealed to Faith? It is not truth in the sense of knowing something, but in the sense of a divine-human personal encounter. God does not reveal this and that; He does not reveal a number of truths. He reveals Himself by communicating Himself. It is the secret of His person which He reveals, and the secret of His person is just this, that He is self-communicating will: that God is Love. . . . If it is true that the word of God is the truth, we have first to distinguish between Truth in the singular, which means God, and truths in the plural, which are truths about the World. As God is the Creator . . . and the World is His creation . . . so there are also two kinds of truths: God-truth and world-truths. It is one of the great tragedies of Christian history that this distinction has not been carried through.'²

When this difference had been recognized—and only then—it might begin to be possible for pilgrim souls to feel their way towards an angle of spiritual vision from which the real nature of the relation between these diverse kinds of experience would become apparent.

'Even that which we know by God's revelation, we know only in part.³ It is absolute truth merely in so far as it is God's word; formulated by us as our knowledge, it at once becomes part in the whole weakness and imperfection of our human condition. God's revelation identified with human dogma is the transformation of God-truth into world-truth.'⁴

This verbal reconciliation of scientific truth and prophetic truth in terms of Theology had placed an unnecessary additional stumbling-block in the pilgrim's anyway arduous path; and this theological stumbling-block was a formidable one because it drove Science and Religion into

¹ Mr. Martin Wight comments: 'What would a genuine solution be? They [the creeds] are attempts to make statements about the Incomprehensible within the limits of human language. They have never claimed to be anything but approximations.' The writer's comment on this would be that the Intellect is deluding itself when it imagines that it has arrived at even approximations between incommensurables.

⁴ Brunner, op. cit., first part, pp. 41-42.

a conflict in which either combatant found himself constrained to make the desperate choice of surrendering to his opponent ground which he knew to be his own legitimate territory, or else capturing the entire field of Truth for himself and denying his opponent any *locus standi* there at all.

This conflict had been bound to break out sooner or later as a result of the foregoing verbal accommodation; for, when once the truth of Revelation had been formulated verbally in terms of the truth of Science, Science could not forever forbear to criticize a body of doctrine that purported now to be true in the scientific sense; and in fact, since the seventeenth century of the Christian Era, a Modern Western Science had broken the truce with Christian doctrine into which the Hellenic philosophy had entered in the fourth and fifth centuries when it had lent its services for the freezing of Christian orthodoxy in the mould of the creeds. On the other side, Christianity, when once its doctrine had been formulated in rational language, could not forbear, for its part, to claim authority over other provinces of knowledge which were really Reason's legitimate domain; and, when in the seventeenth century a Modern Western Science cast off the spell of Hellenic philosophy and began to break new intellectual ground, the first impulse of the Roman Church was to issue an injunction against the aggression of an awakening Western intellect upon the Church's old Hellenic intellectual ally—as if the geocentric theory of Astronomy, which was an Hellenic endorsement of a Babylonian hypothesis, had been an article of the Christian faith, and Galileo's correction of Ptolemy had been a theological heresy.

Possible Alternative Outcomes

By the year A.D. 1952, this war between Science and Religion in the soul of Western Man had been raging with increasing fury for three hundred years without having yet reached a decision. It could no longer continue to be waged with impunity, and of three conceivable alternative outcomes—the discrediting of Religion, the capitulation of Science, and a peace based, not on a verbal formula, but on a genuine reconciliation of the two points of view—either of the first two would manifestly be disastrous.

Towards the close of the two and a half centuries between the ending of the Wars of Religion and the outbreak of the general war of A.D. 1914-18, the discrediting of Religion might have seemed to be the most probable denouement. By that time the ecclesiastical authorities had come to be in much the same state of mind as the Governments of Great Britain and France after Hitler's destruction of the remnant of Czechoslovakia on the 15th March, 1939. For more than two hundred years the churches had been seeing Science capture from them one province of knowledge after another. Astronomy, Cosmogony, Chronology, Biology, Physics, Psychology had each in turn been reconstructed by Science on revolutionary lines that were incompatible with established religious teaching on these subjects; and no end of these losses was in sight. The conquest of one province, so far from contenting the aggressor, had, each time, led him on to attack another. The appetite

of Science for aggression appeared to be insatiable, and the churches had come to feel that they could no longer afford to practise 'appeasement'. Their only remaining hope of saving themselves from utter rout now lay, as they saw it, in a complete intransigence. They must hoist the signal 'My doctrine, right or wrong', and must refuse to surrender even the shakiest outworks of their Maginot Line. They must not abandon one single further tenet, however unimportant or however indefensible. They must insist that their prophetic truth was Truth in the scientific sense, and that the silt which they had scoured out of the archaic rocks of Primitive Religion was of the essence of their own living waters and was not an extraneous impurity that could and should be dropped.

This 'die-hard' spirit had asserted itself in the course of the nineteenth century of the Christian Era. In the ranks of the Roman Catholic Church it had found expression in the decrees of the Vatican Council of A.D. 1869-70 and in the anathema pronounced against Modernism in A.D. 1907;¹ in the domain of the Protestant Churches of North America it had entrenched itself in 'the Bible Belt'; and this reaction had not been confined to those fractions of Christendom that constituted the home territory of the Western World; for by this time the wave of Westernization was sweeping over the whole face of the planet, and Western Science—which was both the force behind the wave and the rider on its crest—was impinging upon all branches of all the higher religions. Under this ubiquitous pressure the 'Zealot' mood² was manifesting itself in Orthodox as well as in Western Christendom, and it was simultaneously on the war-path in the Islamic World, where the first stirrings of a Westernizing movement under the stimulus of the disastrous ending of the Great Russo-Turkish War of A.D. 1768-74 had provoked, in retort, the militantly archaistic movements of Wahhabism, Idrismism, Sanusism, and Mahdism in the fastnesses of the Arabian and North African deserts.

This 'die-hard' reaction of the churches to the victorious advance of Science was not unnatural, but it was unfortunate and it was ominous; for it was a symptom, not of self-confidence, but of the loss of it, and indeed the disarray into which their own camp had fallen by this time could not fail to rack the ecclesiastical authorities' nerves. A decay of belief in the churches' doctrines, and a still more deadly loss of faith in their mission and slackening of loyalty to their cause, had revealed itself first within the small circle of a sophisticated minority in the Western World which had been disillusioned by the Wars of Religion.³ By the turn of the nineteenth and twentieth centuries this spirit of scepticism and indifference had spread in the West among the masses and had also flowed out of the West into the domains of the other surviving civilizations, where a nineteenth-century French type of Rationalism with an anticlerical tinge was becoming the standard *Weltanschauung* of the

Westernizers. In fact, at the opening of the twentieth century it looked as if the higher religions were riding for a fall.

This prospect that the higher religions might irretrievably lose their hold upon the allegiance of Mankind boded evil; for Religion is manifestly one of the essential faculties of Human Nature. No individual human being and no human community is ever without a religion of some kind; and, when people are starved of Religion, the desperate spiritual straits to which they are reduced by being deprived of this necessity of life can fire them to extract grains of religious consolation out of the most unpromising ores. The classical example of this, up to date, was the astonishing metamorphosis by which the religion of the Mahāyāna had been conjured out of the forbiddingly impersonal philosophy that had been the first attempt of the disciples of Siddhārtha Gautama to formulate the message of the Buddha. In a Westernizing World in the twentieth century of the Christian Era the beginnings of a similar metamorphosis of the Western materialist philosophy of Marxism were perhaps discernible in Russian souls that had been deprived of their traditional religious sustenance.

When Buddhism had been converted from a philosophy into a religion, a higher religion had been the happy outcome; but, if the higher religions themselves were to be driven off the field, it was to be feared that lower religions would swiftly occupy the abhorrent vacuum.

In a world on which the higher religions had been losing their hold there were in A.D. 1952 many people who had been finding substitutes for lost higher religions in 'ideologies', and in several countries the converts to these new mundane faiths had been strong enough to seize control of the government and to use the whole power of the state to impose their own doctrine and practice on their fellow countrymen. By these methods Communism had been established in Russia, Fascism in Italy, National Socialism in Germany. But these flagrant examples of the recrudescence of Man's ancient worship of himself in the panoply of his corporate power gave no measure of the actual prevalence of this spiritual malady. The most serious symptom was that, in professedly democratic and professedly Christian countries, whose complacent citizens were congratulating themselves that they were not as other men were,¹ or even as this Fascist or this Communist, four-fifths of the religion of five-sixths of the population in these countries likewise was, in practice, by this time, the primitive pagan worship of the bee-hive by the bee and of the ant-heap by the ant.² This recrudescence of idolatry was not redeemed by being concealed under the fine name of patriotism;³ and, indeed, in this unacknowledged cult of it, its influence was more insidious than in the naked Fascism and Communism at which the

¹ Luke xviii. 11.

² See pp. 439-40 and 445-6, above, and pp. 520-1, below.

³ The termite can idolize the termitery at the cost of condemning its kind to the fate of Lot's wife; but the human soul that idolizes a Corporate Humanity instead of worshipping God condemns itself, not to self-petrification, but to self-destruction. The corporate-self-worshipping human social animal wrecks the fabric of a sociality without which Man cannot survive, in this godless attempt to perfect it. When Man seeks to become a bee in the bee-hive, he turns himself into an Ishmael in the arena, where 'his hand will be against every man, and every man's hand against him' (Gen. xvi. 12).

Christian democratic pharisee pointed his reproving finger, or than in the still franker form in which the same idolatry had been practised in the Hellenic World in the cults of Athena Poliûchus, Tyche Antiocheôn, Fortuna Praenestina, Dea Roma, Divus Caesar.¹

This corporate self-worship was perhaps the most vicious of all the lower religions that were surging in to take the higher religions' vacated place, but it was far from being either the only revenant or the most primitive of these haunting ghosts. In the twentieth century of the Christian Era all the surviving primitive societies and all the hardly less primitive peasantries of the non-Western civilizations—the muzhiks, the ryots, and the coolies who, in their hundreds of millions, amounted to three-quarters of the living generation of Mankind—were being conscripted into the Western Society's swollen internal proletariat;² and, in the light of all the historical precedents, the ancestral religious practices through which this host of humble new recruits would continue to seek satisfaction for their own religious needs seemed likely to find their way into the empty hearts of the proletariat's sophisticated masters.

On this showing, a crushing victory of Science over Religion would be a disaster, for, if Science should succeed in expelling the higher religions from the human heart, she would not be able to prevent the lower religions from taking their place.

'When the unclean spirit is gone out of a man, he walketh through dry places, seeking rest; and, finding none, he saith: I will return unto my house whence I came out. And, when he cometh, he findeth it swept and garnished. Then goeth he and taketh to him seven other spirits more wicked than himself, and they enter in and dwell there; and the last state of that man is worse than the first.'³

The same disastrous set-back would likewise be the nemesis of a crushing victory of Religion over Science; for Reason, as well as Religion, is one of the essential faculties of Human Nature, and the historical precedents indicated that, when a higher religion routs an intellectual enlightenment, it pays the penalty of degenerating into a lower religion. Religion cannot deny scientific truth, or suppress free and disinterested scientific inquiry, with impunity. When Religion commits this crime, the society that is the victim of it becomes petrified; for a civilization that allows itself to be castrated intellectually is allowing itself to be deprived of part of its creative faculty—in which intellectual creativity is an essential element.

In the histories of other civilizations known to latter-day Western students of History, there were notorious examples of this calamity. When the Hellenic philosophy had capitulated to Christianity in the fourth and fifth centuries,⁴ and to Islam in the ninth and tenth centuries, of the Christian Era, and when the Sinic philosophy had capitulated

¹ See I. i. 443-4.

² Luke xi. 24-26; cp. Matt. xii. 43-45.

³ For an explanation of this portent, see the passage quoted from Edwyn Bevan in V. v. 558-9. Mr. Martin Wight comments: 'The passage quoted from Edwyn Bevan simply makes the point that Philosophy capitulated because it was inadequate to human needs, and implies that the capitulation was good and necessary.'

⁴ See V. v. 153-4.

to the primitive religions of a swollen Sinic internal proletariat during the last two centuries B.C.,¹ the victorious religion had in each case paid for its victory by suffering a set-back that had been not merely an intellectual but a moral and a spiritual reverse as well.² In the Western World at the close of the nineteenth century of the Christian Era the triumphantly militant men of science would have laughed to scorn any suggestion that they, in their turn, might be on the eve of making a similar surrender, and the 'die-hard' defenders of the integrity of traditional religion would have been almost equally surprised, in their heart of hearts, to receive tidings of the imminence of this miraculous reversal of roles at this stage of their long losing battle against their aggressive rationalist opponents; yet, only fifty years later, the outlook and temper of the men of science had in fact already changed to an astonishing degree as a result of the shattering experience of two world wars.

During the quarter of a millennium ending in August 1914 the Western man of science—surveying the world around him, believing that he had made it,³ and never doubting that it was very good⁴—had been buoyed up by the naïve conviction that he had only to go on churning out fresh scientific discoveries, and leaving it to his technological and commercial executants to apply these discoveries in any way that might please them, in order to ensure that the World should go on growing better and better. The pace of scientific, technical, and economic progress was accelerating, and no limit was in sight. The scientist's observation of the current phenomena was not incorrect, but his interpretation of them was vitiated by two fundamental errors.

The scientist was mistaken in attributing the relative well-being of the eighteenth-century and nineteenth-century Western World to his own intellectual achievements; and he was mistaken in assuming that this

¹ See the passages quoted from Dr. Hu Shih in V. v. 549 and 555-6. Mr. Martin Wight comments: 'In so far as the Sinic philosophy capitulated, was it not rather to the Mahāyāna—at any rate in the long run—than to the primitive religions of the internal proletariat?'

² Mr. Martin Wight comments: 'The examples that you give do not bear out your thesis. (i) It seems rather question-begging to adduce the Hellenic philosophy of the fifth to tenth centuries of the Christian Era as an instance of "an intellectual enlightenment": most people would regard it as an instance of the moribundity of a particular philosophical tradition, reflecting the moribundity of a particular civilization—and this would be consonant with your general view of a philosophy as the expression of a Dominant Minority. "An intellectual enlightenment" usually means a creative phase, like the Ionian philosophy of the sixth-fifth centuries B.C. or the Aufklärung of the eighteenth century of the Christian Era. Actually the three examples that you give are all examples of a philosophy giving up the ghost in the last stages of the decadence of a civilisation—and would it not be natural to regard this as a regular feature of that process, wherein (as you have argued throughout) the higher religion inherits the past and transmits it to the future? (ii) Did Christianity in the fifth century of the Christian Era, and Islam in the tenth, "pay the penalty of degenerating into a lower religion"?'

The writer would accept Mr. Wight's contention that each of the three philosophies cited in this passage had exhausted its creative powers long before the free exercise of its now traditional and conventional mode of thought was suppressed by a higher religion; but he would also contend that in each case the repressive higher religion inflicted—as the historical sequel in each case shows—a deep spiritual injury on itself in the act of suppressing even a moribund intellectual activity.

³ This belief was advertised, as late as A.D. 1936, by an eminent latter-day Western archaeologist, Mr. V. Gordon Childe, in the title of his book *Man Makes Himself* (London 1936, Watts). See p. 541, n. 2, below.

⁴ Gen. i. 13.

recently achieved well-being was going to persist in *saecula saeculorum* and to increase *ad infinitum*. A Modern Western Science had been, not the author, but merely the beneficiary, of the lull between the dying down of the storm of the wars of religion and the rising of the storm of the wars of nationality—a new tempest which had breathed its first ominous gust in the American Revolutionary War, and had blown half a gale in the wars of the French Revolution and Napoleon, before it had burst on the World in its full fury in the general wars of A.D. 1914–18 and A.D. 1939–45.¹ The breathing-space between these two paroxysms in the recent course of Western history had been the achievement, not of eighteenth-century and nineteenth-century Western scientists, but of seventeenth-century Western statesmen who had come to the conclusion that the wars of religion were leading nowhere but towards destruction and that this senseless barbarity ought to be stopped. These statesmen had duly brought the wars of religion to an end, but their work had been ephemeral because it had been performed in a cynical spirit, on the strength of a mistaken diagnosis of Human Nature. The spiritual truce that had reigned from the close of the seventeenth century to the opening of the twentieth had been founded on the false assumption that Religion, so far from being one of the essential faculties of the Soul, was a relic of savagery which a civilized society had now learnt, by bitter experience, to discard once for all. The psychic energy released from the baneful service of this supposed anachronism was henceforward to be led into the channels of Science and Technology, where its free flow was expected to prove, not merely harmless, but positively useful.

Before the twentieth century had run half its course, the falsity of these beliefs and expectations about their society's situation and prospects had been demonstrated to Western men of science by the shattering effect of two catastrophic world wars in one lifetime on the society of which they were members and on the intellectual activity which was their own vocation. The scientists had seen their society driven once again along the road leading towards destruction; they had seen their own inventions and abilities conscripted, without their leave being asked, in order to speed the World on this fatal course; and their political impotence and moral responsibility had both been brought home to them, in the last act of the Second World War, by the dropping of the atom-bombs on Hiroshima and Nagasaki. The discovery of the structure of the atom, which was the supreme achievement, up to date, of Western Science, and the working-out of the 'know-how' for disintegrating atoms on a scale that would produce effectively devastating results, which was the supreme achievement, up to date, of Western Technology, had been used to arm Man with an annihilating weapon before he had got rid of the institution of War; and this appalling application of Physical Science had cut the scientists to the heart and at the same time confronted them with a moral dilemma.²

¹ See IV. iv. 141–85; V. v. 160–1 and 668–72; V. vi. 316–21.

² See, for example, the presidential address on 'The Ethical Dilemma of Science' that was given by Professor A. V. Hill to the British Association on the 3rd September, 1952.

In a world which had not yet got rid of War, atomic research itself, as well as its practical application in the manufacture of annihilating weapons, threatened to be a desperately dangerous occupation for human minds and hands unless and until it were to be brought under the undivided political control of some single world authority. Pending the attainment of this supremely difficult international objective, it would inevitably remain under the political control of individual Great Powers that possessed the secret and that commanded the resources to turn it to military account. Political control of atomic research was thus morally desirable in one form, and practically inevitable in some form or other; but this would mean the end of the liberty to conduct research, and to make public the results of his labours, at his own discretion, which the Modern Western man of science had enjoyed for the last quarter of a millennium. In the seventeenth century, Science had wrested this liberty from the Church, and now, in the twentieth century, she was to forfeit it to the State. The prospect was disconcerting, for the right of free inquiry and publication was Science's palladium. It was the breath of her nostrils; it was the key to her unprecedented performance in the Western World in the Modern Age; and, most important of all, it was a moral principle of which she was the recognized trustee on behalf of Mankind at large, beyond the narrow ranks of the small minority represented by the professional scientific workers.

In this situation, an inclination to capitulate was already revealing itself, midway through the twentieth century, among physical scientists and other intellectual workers in a now battered and disillusioned Western World. Some had been crushed by the adversity which had overtaken their own intellectual avocation; others had had their hearts broken by the tribulations that had overtaken Mankind, their country, their family, and themselves; others had yielded to political pressure or coercion; others had been infected with the 'second childhood' that was rife in a 'Brave New World' around them; while others—and this was the most significant and most dangerous case—lacked the fortitude to bear patiently the spiritual distress of having lost a traditional religion without having gained a new one to take its place.¹ These weaker vessels were seeking an intellectual *Nirvāna* by embracing either another traditional religion, carrying a still heavier load of archaic silt than the faith of their fathers, or else one of the new mundane 'ideologies'. Either of these alternative spiritual refuges offered the fugitive what he was seeking; for he was fleeing from a no longer bearable intellectual liberty and was seeking asylum in a spiritual prison-house.

This failure of nerve was *la trahison des clercs*;² and the error was one both of conduct and of judgement. If *noblesse oblige*, it is unworthy of the intellectual leaders of Mankind not to stand their intellectual ground when they find themselves out in the cold or marooned in the wilderness. Their high intellectual calling cannot be practised if its votaries cannot

¹ In deploring contemporary reversions to traditional religions when these were the fruit, not of conviction, but of distress, the writer would not deny that there were also contemporary reconversions that had the virtues of being disinterested and being sincere.

² Benda, J.: *La Trahison des Clercs* (Paris 1927, Grasset), quoted in IV. iv. 302.

rise to the legendary moral strength of Moses and the bodhisattvas. Moses had not quailed when he had been condemned to wander in the wilderness for forty years in atonement for sins that had been not his own but Israel's, and then to die without being granted more than a Pisgah sight of the Promised Land. The bodhisattvas had become the heroes of the Mahāyāna, and had eclipsed the arhats in the hearts and minds of their devotees,¹ because at the supreme moment when, in virtue of aeons of spiritual effort, they had attained the verge of *Nirvāna* and need only take the last final step in order to enter into their rest,² they had risen to a sublime height of unselfishness in condemning themselves, uncoerced and unprompted, to postpone their release from selfhood for aeons upon aeons more, in order to pilot their fellow beings along the arduous road, leading to salvation from the sorrowful wheel of existence, which the bodhisattvas themselves had travelled, in advance of their flock, to within a hair's breadth of journey's end.³

The heroic self-control of the bodhisattvas was the example which the intellectual leaders of Mankind needed to take to heart in a Westernizing World in the twentieth century of the Christian Era, because the hope of finding a second-best Promised Land just round the corner, in the *cañon* of Edom or in the mountains of Moab, was as illusory as the temptation to slink back to the flesh-pots of Egypt was craven-hearted. It was an illusion because Religion, once lost, whether the loss of it has been the loser's fault or no, can never be whistled for, like a dog, to come back obediently to heel at Man's convenience. If the wanderer in the wilderness is eventually to reach the authentic Promised Land, he must have the endurance to stay the course; and, in the West midway through the twentieth century of the Christian Era, it was uncertain how the men of intellect were going to take their ordeal.

Thus, after three hundred years of spiritual warfare in the West between Science and Religion, it was impossible to guess which way the decision would fall if the outcome was to be a decisive one. Both combatants were in danger of collapsing; and the only prophecy that could be made with any assurance was that, if their discomfiture were not simultaneous, the overthrow of the first to collapse would not spell victory for the momentary survivor. Whichever way the battle might eventually go, the real victor would be a *tertius gaudens* in the shape of a host of primitive religions that were hovering round the battlefield on the wait for an opportunity to reoccupy a spiritual kingdom over which they had reigned unchallenged for hundreds of thousands of years before the advent of either Reason or Revelation.

A Demarcation of Spheres

This threat of a calamitous spiritual regression in the event of a fight to a finish between Science and Religion was an urgent warning of the need for a peace by agreement; but, if the peace was to be lasting, the agreement must be genuine, as had been demonstrated by the sequel to the diplomatic accommodation that had been made—in words but not

¹ See V. vi. 148, and p. 426, n. 2, above.

² Ps. xcvi. 11.

³ See V. vi. 164, n. 3, and p. 426, n. 2, above, and IX. viii. 628 and XII. ix. 633, below.

in deed—between a Christian revelation and an Hellenic philosophy in the fourth and fifth centuries of the Christian Era.¹ This untoward precedent indicated that it was not enough that the parties should agree about the facts; their agreement with one another, if there was to be any virtue in it, must also tally with reality.

This last point may be illustrated by picturing a pair of Oklahomans travelling, on the last lap of their first journey to the East, on the Pennsylvania Railroad between Newark and New York. The two provincial travelling companions have different interests in life; one of them is technological-minded, the other political-minded; but both are patriots. As their train cuts its way across the dismal reed-beds of the Jersey marshes, they see out of the coach-window a remarkable engineering enterprise in full swing. A section of the marshes is being filled in to make a site for a new factory or power-station or what-not, and this arresting spectacle moves either spectator to ejaculate the first thought that comes into his head. 'My goodness,' exclaims the Oklahoman technocrat, 'if they go on at this pace they will soon have filled in the Atlantic, and that will teach Joe Stalin what Uncle Sam can do!'—'Good gracious,' exclaims the Oklahoman politician at the same instant, 'if they go on at this pace they will soon have filled in the Atlantic, and

¹ A Catholic friend of the writer's comments: 'The Church never considers any philosophy more than an approximation to the truth, and would discard Aristotle to-morrow if it found a philosophy that went deeper into reality.' The writer would not dispute his friend's contention that this was the Christian Church's theory of the terms on which it had made use of an Hellenic philosophy for the formulation of a Christian theology; he would simply note that, in practice, the Church was still treating this Hellenistic theology as the orthodox, official, and obligatory presentation of the Christian Faith fifteen or sixteen hundred years after the epoch in which Christianity had originally been translated into this Hellenic philosophical language. Notable attempts, made in the Early Modern Age of Western history by missionary members of the Society of Jesus, to retranslate Christianity into the alternative language of a post-Buddhaic Hindu philosophy and a Confucian philosophy had eventually been quashed (see V. v. 365-7). Yet, if the Christian Church, as an institution, thus remained enmeshed in an Hellenistic theology of its own weaving, the greatest of all Western Christian theologians lived, in his personal religious life, to become aware of the limitations of theology through attaining the experience of transcending them.

'Item dixit idem testis, quod, cum dictus Fr. Thomas celebraret Missam in dictâ capellâ S. Nicolai Neapoli, fuit mirâ mutatione commotus, et post ipsam missam non scripsit; neque dictavit aliquid, imo suspendit organa scriptionis in tertiâ parte Summae in Tractatu de Poenitentia: et, dum idem Fr. Raynaldus videret, quod ipse Fr. Thomas cessaverat scribere, dixit ei: Pater, quomodo dimisistis opus tam grande, quod ad laudem Dei et illuminationem mundi coepistis? Cui respondit dictus Fr. Thomas: Non possum. Idem vero Fr. Raynaldus timens, ne propter multum studium aliquam incurrisset amentiam, instabat semper, quod idem Fr. Thomas continuaret scripta, et similiter ipse Fr. Thomas respondit: Raynalde, non possum, quia omnia, quae scripsi, videntur mihi paleae' (Statement by Dominus Bartholomaeus de Capuâ, logotheta et protonotarius regni Siciliae, in the *Processus Inquisitionis Factae super Vitâ, Conversatione, et Miraculis recol. mem. fr. Thomae de Aquino*, printed in *Acta Sanctorum, Martii, Tom. I, pp. 712f-713a*).

'Unde post aliquam horam ivit socius ad Magistrum, et, trahens ipsum per cappam fortiter, quasi a somno contemplationis ipsum ultimo excitavit. Qui suspirans dixit: Raynalde fili, tibi in secreto revelo, prohibens ne in vitâ meâ alicui audeas revelare. Venit finis scripturae meae, quia talia sunt mihi revelata, quod ea, quae scripsi et docui, modica mihi videntur, et ex hoc spero in Deo meo quod, sicut doctrinae, sic cito finis erit et vitae' (Evidence given during the Process by the Prior of the Convent at Benevento, extracted from the life of Saint Thomas by Giulielmus de Thoco, O.P., and printed *ibid.*, p. 674c).

A spirited English version of these two passages, with characteristic comment, will be found in Bridges, Robert: *The Testament of Beauty*, Book I. ll. 465-500, particularly the last seven lines, which literally translate from 'Qui suspirans dixit' to the end.

then what will become of America's security? Why, the Red Army will be able to march on Oklahoma dry-shod! Agreeing about the facts, and never suspecting that their identical reading of them may be wrong, the two unsophisticated wayfarers fall to quarrelling, as their train drives into darkness under the Hudson, over the question whether the imminent abolition of the Atlantic is going to be a good thing or a bad thing. They could have spared themselves their quarrel if they had had the imagination to realize that the marshes and the Ocean were incommensurable, and that the integrity of the Atlantic was no more in danger from those forceful and efficient Yankee engineers with their bulldozers than if they had been little children armed with toy spades and buckets. In transforming a patch of the morass into solid earth the engineers had been doing a creditable job, but they had not been miraculously achieving the impossible. They had, in fact, been doing an economic service to their country without jeopardizing her military security. But Man does not find it easy to imagine what he has not experienced, and we have to bear in mind that our pair of rustic Oklahomans have never set eyes on the Atlantic, not to speak of crossing it. If they had ever sailed on its waters or sounded its depths, it would not have occurred to them to think of the Ocean as an annex to the Jersey marshes.

The application of our parable to a current Western spiritual crisis is, of course, to be found in the suggestion that, if only the men of science and the religious authorities could agree in seeing the facts as they were, instead of agreeing in making an identical mistake about them, they might come to agree over the hitherto controversial question whether the facts were to be welcomed or were to be deplored. Either party might then arrive at a just self-confidence in estimating its own prowess and a just humility in recognizing its own limitations, and this psychological reorientation might enable them both to serve God and Man by overcoming their discord and working together in harmony.¹

Science need abandon neither her belief in her mission to give Man an ever-increasing command over Non-Human Nature nor her confidence in her ability to go on winning successes in her own proper field. It could, indeed, be predicted that, with her marvellous enterprisingness and resourcefulness, she would go on reclaiming, for Man's benefit, one patch after another of Non-Human Nature's sterile and formidable slough, but the date could not be foreseen by which she would have converted the whole of this waste land into productive turnip-fields and remunerative building-lots, and the time would never come when she would have made dry land out of the Ocean. It was at this point that a saving humility—the sovereign prophylactic against the fatal sin of

¹ A belief that there is no ground for a collision between Faith and Science is attributed to the Modernists by Pope Pius X in his encyclical 'Pascendi dominici gregis' of the 8th September, 1907:

'Fides . . . id unice spectat, quod scientia incognoscibile sibi esse profitetur. Hinc diversum utrique pensum: scientia versatur in phaenomenis, ubi nullus fidei locus; fides e contra versatur in divinis, quae scientia penitus ignorat. Unde demum conficitur, inter fidem et scientiam nunquam esse posse discidium: si enim suum quaeque locum teneat, occurrere sibi invicem numquam poterunt, atque ideo nec contradicere.'

hybris—might usefully steal over the giantess's mind while she was rejoicing to run her course.¹

Man's Intellect is always in danger of being dazzled by its own triumphs through overlooking the sobering truth that, by comparison with the Soul, the Intellect has an easy task. The field within which the Intellect makes its conquests is relatively narrow, and the objects with which it deals are relatively tractable. A triumphant Modern Western Science and Technology should reflect and confess that, before the expiration of the Upper Palaeolithic Age, Man's Intellect had already fulfilled the essence of its modest task of making Man 'the lord of Creation' by taking delivery of God's gift to Man of 'dominion over the fish of the sea and over the fowl of the air and over the cattle and over all the Earth, and over every creeping thing that creepeth upon the Earth'.²

'The evidence derived both from a study of fossil remains and from a study of primitive races leads to the conclusion that the evolution of human intellectual capacity early reached a relatively advanced stage. . . . It would seem that the major part of the progress in the evolution of the intellectual faculties had been accomplished far back in Palaeolithic times. Those living races which, with all due reservations and qualifications, may be held to represent in mental and bodily characters Palaeolithic races, differ from Modern European Man rather in disposition than in intellect. And it is important to note that it is in the growth of the Intellect rather than in the growth of the other mental faculties that Modern Man is distinguished from his pre-human ancestor. . . . An inquiry into the forces which we must assume to have been at work shows that intellectual capacity was more favoured in the intermediate stage than after Primitive Society had come into being. . . . Within this period, Man descended to the ground, spread, if not into every continent, at least far over the surface of the World, and came to dominate all other living organisms as no species had ever done before. Clearly he was enabled to achieve this result by his [already attained] intellectual powers and by them alone.'³

From that stage upwards in the ascending and accelerating course of Man's scientific and technological progress, Man had never lacked the necessities of material life; all subsequent additions had been superfluities; and these superfluous increments of material wealth and power had not been blessings in themselves; they had been searching tests of Man's character, proving themselves blessings if he used them for good, and curses if he used them for evil.⁴ Such double-edged material gifts had been challenges to Man's spiritual nature; and the challenge had become more formidable with each fresh scientific and technological advance, because each had added momentum to the material 'drive' that goes into Man's moral acts, whether good or bad. Man's apparently boundless ability in mastering his material environment had thus played, in Man's spiritual life, the part played by Mephistopheles in Faust's;⁵

⁵ See II. i. 271-99.

and in this sense only—and it was a negative sense which was at the opposite pole from Marx's—Man's economic progress had been the key to human history.

The truth is that the command over Non-Human Nature, which the Intellect has in its gift, is of almost infinitely less importance to Man than his relations with himself, with his fellow men, and with God. But 'Abstract Reason does not tend to communion, but to unity. In thinking I am related to general truth, to ideas, but not to the Thou of my neighbour';¹ and Man's Intellect would never have had a chance of making Man the palaeolithic Lord of Creation, and never even a possibility of achieving its own existence, if Man's pre-human ancestor had not been endowed with the capacity for becoming a social animal, and if Primitive Man had not risen to this spiritual occasion so far as to school himself in those rudiments of sociality that are the Intellect's indispensable conditions for performing its co-operative and cumulative work.² And, when once Man's Intellect had given him dominion over Non-Human Nature on the face of this planet to a degree that made it certain that Man would be able to keep the Human Race in existence here so long as the physical conditions might continue to allow of the possibility of mammalian life, Man's command over Non-Human Nature ceased, from that time onwards, to have significance apart from providing a test of Man's capacity, and a gauge of his success or failure, in the spiritual field. From that time onwards at any rate, if not from the first moment at which Man's pre-human ancestor had become human, Man's intellectual and technological achievements had been important to him, not in themselves, but only in so far as, by penalizing his moral failures and rewarding his moral successes, they had forced him to face, and grapple with, moral issues which otherwise he might have managed to go on shirking. They had driven him through dry places, seeking rest and finding none,³ as Io was goaded by the ceaseless stings of Hera's gadfly.

Through its unprecedented achievements on its own plane a Modern Western Science had indeed raised moral issues of profound importance, but it had not solved any of these moral problems and had not even made any contribution towards solving any of them, because it had not added anything to Man's knowledge of Man and God, or to his insight into how to deal with either of them. 'The most important questions that Man must answer are those for which scientific knowledge is not enough.'⁴ 'The possession of Reason, of intellectual activity as such, is no guarantee of Truth, Goodness, and true Humanity. The principle of the truly human, of Goodness and Truth, is higher than Reason.'⁵ In spiritual insight and action the higher religions still remained the pioneers; and their unique achievement in this crucial field put them in a light to which a Modern Western Science ought to open its eyes. For

a quarter of a millennium, reckoning back from the year A.D. 1952, a Modern Western rationalism had been deriding traditional religion for its reluctance to drop the flotsam of primitive rites and myths that it had still been carrying along in its current,¹ and this attack had been justified in so far as the ecclesiastical authorities had continued to insist on explaining traditional practices, and formulating traditional beliefs, in the antiquated intellectual terms of an ephemeral Hellenic or Indic exposition of Philosophy.² But, in passing this just judgement on the theologian, the rationalist was exposing himself to the stricture of the Gospels:

'Why beholdest thou the mote that is in thy brother's eye, but considerest not the beam that is in thine own eye? Or how wilt thou say to thy brother: Let me pull out the mote out of thine eye; and, behold, a beam is in thine own eye? Thou hypocrite, first cast out the beam out of thine own eye, and then shalt thou see clearly to cast out the mote out of thy brother's eye.'³

It was not only the fact that, on the spiritual plane, where one inch gained is of greater consequence for Mankind than a mile gained in supererogatory additions to Man's command over Non-Human Nature, traditional religion was still holding the lead; it was also the fact that, in the latest chapter of Western history, in which a Modern Western Society had placed her destinies in Science's hands, she had been as sensationally unsuccessful in things human and divine as she had been sensationally successful in things material. The exercise of humility that was required of a Modern Western Science was, not to lose confidence in her prowess within her own field, but to recognize the bitter truth that, in spite of all her intellectual achievements—past, present, and future—she was spiritually impotent, and that Socrates had taken the right turning at that critical point in his life at which he had abandoned the study of Physical Science in order to seek communion with the spiritual power that informs and governs the Universe.⁴ The Hel-

¹ See the passage from Butler's *Analogy*, quoted in V. v. 670, n. 3.

² Mr. Martin Wight comments: 'What is the criterion of obsolescence in Philosophy? Plato and Aristotle are the two philosophers who have been drawn upon by Christianity most—are they obsolete? In what sense is the Logos doctrine antiquated, in which the Aeschylean doctrine of *πάθει μᾶθος* is not? If one thinks of a moral or intellectual tradition, not in the physico-geographical terms of a silt-laden river, but in the perhaps more accurate and appropriate biological terms of ontogenesis or of a tree putting on rings, then very little (if anything) is seen as antiquated or ephemeral: everything takes its place in a tradition that steadily develops and becomes richer, the new reflecting back upon and giving fresh meaning to the old. This figure of organic growth is the Biblical one (Eph. iv. 13-16).'

The writer of this Study would agree that Man's intellectual equipment is a cumulative heritage that is perpetually being enriched by a continuing process of growth; and, for this very reason, he would submit that each successive stage of Man's intellectual achievement is as ephemeral as the girth of a tree in any particular year, whereas a flash of spiritual insight, like Aeschylus's perception that learning comes through suffering, is perennial because it is complete and perfect in itself. This point is examined further in X. ix. 697-704.

³ Matt. vii. 3-5; cp. Luke vi. 41-42.

⁴ The story of Socrates' conversion is told by Plato, ostensibly in Socrates' own words, in *Phaedo*, 96-97, quoted in III. iii. 186-7.

'This was the line taken by Socrates; and, after him, the school of Aristippus of Cyrene, and later on the school of Ariston of Chios, took up the position that Philosophy ought to confine itself to Ethics, on the ground that Ethics were both a feasible and a useful field of inquiry, in sharp contrast to a Physical Science which [according to this

lenic philosopher's momentous choice had indeed been approved by a Modern Western Christian man of science:

'La science des choses extérieures ne me consolera pas de l'ignorance de la morale au temps d'affliction; mais la science des mœurs me consolera toujours de l'ignorance des sciences extérieures.'¹

In its pursuit of the audacious task for which it has been equipped and commissioned by its Creator, the Human Intellect is indeed perpetually courting the nemesis that is visited upon the sin of hybris.

'It is as true to-day as ever that the Promethean man who thus disturbs afresh the primordial balance of Nature will have to pay for his impiety. Yet he cannot forswear the principle he serves. . . . Never before in the history of Man has the pride and power of the Intellect as a means of superiority over Nature been so proudly asserted as it is to-day. . . . The development of . . . the Scientific Intellect . . . has, more than any other single cause, served to repress the intuitive science of Antiquity which gave ear to the voice of dreams and which honoured the wisdom that tried to discern naturally revealed truths rather than the capacity to accumulate data.'²

From the same angle of vision, we can see the points in which humility and self-confidence were required of the higher religions. The ecclesiastical authorities ought to be confident about the essence, and humble about the accidents, of the faiths of which they were the momentary trustees.

Religion ought to be prepared to surrender to Science every province of intellectual knowledge, traditionally within Religion's field, to which Science might succeed in establishing a title.³ A just humility would

school of thought] was in the first place incomprehensible, while in the second place it could never be of any use even if it could be brought into focus. Physical Science would always leave us just where we were, even if it were to carry us aloft, higher than Perseus, "above the face of the deep and above the Pleiads", to give us a direct physical vision of the whole Cosmos and the nature of Reality, whatever that may be. This scientific enlightenment would not make us any wiser or juster or braver or better, not to speak of its not endowing us with the blessings of strength and beauty and wealth, which are essential for happiness' (Eusebius: *Præp. Evang.*, xv. lxiii. 7 (p. 854 c), reprinted in von Arnim, J.: *Stoicorum Veterum Fragmenta*, vol. i (Leipzig 1905, Teubner), No. 353).

³ Mr. Martin Wight comments: 'But it is just over this establishment of a title that agreement is so difficult to reach. What is Religion to do when a Freudian or a Behaviourist Psychology asserts a title to the province of Moral Philosophy? The history of the past three centuries has abundantly shown that Science like every other field of human activity—like Religion itself—is inherently encroaching: it tends constantly to transform itself into the autonomous creed "claiming sovereign jurisdiction over the whole field" of which you speak on p. 473 above; and is Religion not to defend its own truths? Surely there is here an ineluctable warfare arising out of the Faustian nature of the Western tradition (if not of Man himself), and at best this warfare can only be keyed down to what von Hügel, who grappled with this problem more profoundly perhaps than any other Modern English philosopher, used to call a "costing and fruitful tension".'

The writer of this Study would agree that there was bound to be a tension between Religion and Science, if only because of Science's empirical method of inquiry by a process of trial and error. It was the intellectual glory of a Modern Western Science that it was always willing to put its successive hypotheses to the test of a free and unfettered examination, and to modify or even abandon any hypothesis that might be impugned by the progress of thought and discovery. This intellectual honesty, which was a point

require Religion to confess that, if it was true that on the spiritual plane Science was impotent, it was also true that on the intellectual plane Religion was a babe who was childishly prone to err.¹ A just moral probity and self-respect would require Religion to refrain from putting any stumbling-block in Science's way when Science was practising her own sovereign virtue of intellectual honesty by following the argument faithfully whithersoever it might lead. And a just self-confidence would require Religion to comprehend and proclaim that she could go on surrendering to Science one province of intellectual knowledge after another without impairing her own essence or diminishing the infinity of the Kingdom of God—any more than the volume of the Atlantic could be diminished by successive achievements of American civil engineers in the progressive reclamation of the Jersey marshes. Religion could afford to lose the marshes so long as she retained the Ocean; and, more than that, she would not only suffer no appreciable loss; she would win an appreciable gain by getting rid of an alien slime which, on her hands, was nothing but an encumbrance and a defilement.

Religion's traditional dominion over intellectual ground had been an historical accident, and this accident had been as detrimental to the true interests of the provisional occupier of the vacant slough as to those of the tardily appearing rightful owner. On the Time-scale of the age of the Human Race the Intellect's achievement of making Man the Lord of Creation had been a relatively recent event. In the practical sphere, as we have observed,² this had not been achieved until the Upper Palaeolithic Age, and in the theoretical sphere it had not been achieved until the emergence of the civilizations of the first generation. Down to

of honour among Western scientists, was perhaps the chief single cause of their astonishing success; and this admirable empirical method of inquiry, which the men of science followed, manifestly absolved the layman from any intellectual obligation to accept a new scientific hypothesis unless and until it had established its title by surviving the ordeal of being put to the proof in an exhaustive debate among the scientists themselves. The history of a Modern Western Science over a span of some three hundred years, reckoning back from the year A.D. 1952, did, however, indicate that the empirical scientific method of inquiry usually resulted in course of time in producing agreed and assured additions to scientific knowledge; and at this stage the layman who, up to this point, had been justified in suspending judgement would no longer be justified in rejecting Science's considered and tested findings.

The heliocentric hypothesis proposed by a Modern Western astronomy was a classic example of a new scientific theory which had established its title after the authorities responsible for the policy of the Christian Church had committed themselves to a rejection of it. They would have been better advised if they had merely suspended judgement until a final verdict had been pronounced in the court of Science, within whose intellectual jurisdiction the trial of this hypothesis unquestionably fell; and it should have been relatively easy for the ecclesiastical authorities to leave the last word to the scientists in an astronomical province of scientific inquiry which was manifestly rather remote from the realm of spiritual affairs. The same principles, however, would apply with no less force in a province in which questions of moral conduct were involved, as they were in Science's new province of Psychology. In an encounter with a new psychological hypothesis, as in an encounter with a new astronomical hypothesis, Religion would be justified in suspending judgement so long as the hypothesis was on trial in the court of Science, but it would not be justified in rejecting Science's considered judgement on any point of scientific fact.

¹ This proposition had been pilloried by the Sacred Office in Rome, in the Decree 'Lamentabili' of the 3rd July, 1907, as the fifth point in a catalogue of errors imputed to the Modernists:

'Cum in deposito fidei veritates tantum revelatae contineantur, nullo sub respectu ad Ecclesiam pertinet iudicium ferre de assertionibus disciplinarum humanarum.'

² See pp. 486-7, above.

those comparatively recent dates the technical and speculative activities over which the Intellect had not yet asserted her mastery had been fumblingly performed by her, blindfold, under the aegis of Religion and in Religion's name. Primitive Man's success or failure in hunting, in agriculture, in navigation, had to be an affair of the Heart in default of the Head; and this responsibility of Primitive Religion in a field that was not Religion's own had been taken over from their predecessors by the higher religions when the heavenly waters of Revelation had descended upon the Earth and scooped up the soil from the *cañons* that they had scoured out to make beds for mighty rivers. If we ask ourselves whether, on balance, Religion had lost or gained, in terms of her own intrinsic values, by subsequently relinquishing to Science the intellectual provinces of Cosmogony, Astronomy, Geology, and Biology, we shall answer unhesitatingly that she had been the spiritual gainer, and that she had been threatened with spiritual loss only in so far as she had been tempted to convert herself from an unintentional trespasser into a wilful usurper by resisting Science's legitimate claims.

Religion had been the gainer by parting with her dominion over these works of God's creation because, for Religion, this is obnoxious lumber. Religion's task is to lead Man towards his true end of worshipping God and entering into communion with Him, and Man is always apt to miss his goal by turning aside to worship the creature, through whom God is both manifested and obscured, instead of worshipping the Creator Himself.¹ When Religion associates the works of God with their Maker as objects of worship, she is encouraging a spiritual infirmity to which Man is prone instead of helping him to overcome it; and, in view of this, she ought humbly to confess that, so far from doing her an injury, Science is doing her a service in wresting from her, even against her will, the intellectual flotsam that ever threatens to defeat Religion's purpose by becoming an object of idolatry.² For the adherents of a traditional Christianity it had always been evident that the Jewish and Christian iconoclasts of the last two centuries B.C. and the first three of the Christian Era, who had been branded as 'atheists' by their contemporaries,³ had in reality been the liberators of Religion from the idolatrously worshipped ritual impedimenta of an Hellenic paganism. On the same showing, the ecclesiastical authorities of a later day ought to recognize with humility that a Modern Western Science was likewise a liberator

¹ See pp. 460-3, above.

² 'We ask . . . why Copernicanism has shaken the Christian Church and theology to such a degree that even in the beginning of the eighteenth century the government of the Canton of Zürich strictly prohibited the discussion of this theory. . . . Copernicanism had this effect because the Church did, and had done for centuries, what it should not have done. The Church had mixed up truth-of-God with world-truth. It had established and dogmatically canonised the Biblical world-picture of Antiquity, which, because of its origin, we call the Babylonian world-picture, with its three storeys: the flat plate of the Earth; above it and on the same axis, so to speak, the Sky or Heaven; below it the Underworld. This ancient world-picture is merely the vessel in which the divine revelation is given to Man, but has itself nothing to do with that revelation. The Church and its theology therefore were forced by Science to withdraw from a realm which was not theirs. Natural Science has helped the Church to understand its own truth and essence better than it had understood them in the course of preceding centuries' (Brunner, E.: *Christianity and Civilisation*, first part (London 1948, Nisbet), p. 83).

³ See V. vi. 536, and p. 463, above.

from the idolatrously worshipped theological impedimenta of the higher religions.

A Christian Church which had taken it so hard when a Modern Western Science had relieved it of the load of an outworn Babylonian astronomy might be expected to feel a far more vehement distress, resentment, and impulse towards contumacy if it were to be summoned to stand and deliver the hard-set theology in which a living original Christian faith had been petrified in the act of being translated into terms of an Hellenic philosophy.¹ Yet this Hellenic philosophical terminology itself bore witness to its own contingency and relativity in its presentation of a doctrine which was a Christian theology's central and distinctive mystery; for the Greek word *πρόσωπα*—correctly rendered in Latin as *personae*—which had been used by the Nicene Fathers² to describe the three persons of a Triune Godhead, signified the masks worn by the actors on an Hellenic stage; and masks are only another name for veils that perform to a consummate degree the veil's ambiguous function of concealing a countenance by reproducing a simulacrum of its features in an alien substance.³ In the year A.D. 1952 it might be augured that, in carving out for itself a new province labelled Psychology, a post-Modern Western Science would be imposing upon Christianity the most painful and at the same time perhaps most beneficent of all its acts of liberation by stripping away from a Christian theology some of those anthropomorphic veils that had proved in the past to be the most tenacious of all the barriers between the Human Soul and its Maker.⁴ In performing for Christianity this excruciating service, Science, so far from depriving the Soul of God, would assuredly prove to have brought the Soul one step nearer towards the infinitely distant goal of the journey back towards its Maker on which every creature is perpetually travelling all the days of its pilgrimage on Earth.⁵

Such were the gains that Science might be expected to continue to confer upon a reluctant Religion as a result of successive extensions of the bounds of Science's own domain. It was only human that the authorities who had inherited a responsibility for the churches' traditional organization should wince and repine at acts of liberation and enlightenment when these were imperiously imposed upon them by a Science which was not under their control; yet it was certain that the Soul's spiritual progress and profit could never be purchased at the cost of any set-back or loss to the Soul's Creator; for Science's enlargement of her intellectual client kingdom can never abate, by one jot or tittle, the absoluteness of God's eminent domain.

The gain to Religion from surrendering provinces that were not legitimately hers could be measured by the loss that she had invariably suffered through reacquiring them. In a twentieth-century Westernizing World there was no serious prospect of Religion's emulating past pyrrhic victories of hers by reasserting her dominion over lost provinces of

¹ See pp. 470-1 and 473-4, above.

⁵ 'To Him return ye every one' (Qur'ān x. 4).

intellectual theory, such as Astronomy, but there were conspicuous historical examples of Religion's having stultified and sterilized herself by backsliding into politics. In contrast to Primitive Religion, in which the worship of the human ant-heap by human ants had been inextricably entangled with Man's worship of God, the higher religions had shaken themselves free of politics at their birth;¹ for their earthly parents had been prophets who had broken through the barrier of Man's idolatrous corporate self-worship that had intervened between the Soul and God under the previous pagan religious dispensations. This had been the strait gate² through which the prophets had led their followers into a new vista of spiritual life, and its reclosure had invariably had disastrous spiritual consequences. The classic case had been the tragic counter-transfiguration of Muhammad from a prophet without honour in his own country³ into the successful ruler of a rival oasis-state.⁴

This was perhaps the only instance in which a higher religion had been politically debauched by its own founder; but the tragedy of Islam since the *Hijrah*—which Muslims had taken, with characteristic political-mindedness, as the initial date for their distinctive ecclesiastical era⁵—had also been the tragedy of other higher religions at later stages in their careers.⁶ We have seen the same blight overtaking Judaism and Zoroastrianism when they went into political action against the Hellenic conquerors of the Syriac World; overtaking Imāmī Shi'ism when it was mobilized by the Safawis as a mundane weapon against the Ottoman and Uzbeg Powers; overtaking Sikhism when it turned militant against the Mughal Rāj; overtaking a Medieval Western Christianity when it incarnated itself in a *Respublica Christiana*;⁷ and overtaking the modern Protestant variation of the same Western Christianity in so far as it allowed itself to become the established religion of this or that secular parochial successor-state of the abortive ecclesiastical commonwealth of Pope Gregory VII and Pope Innocent III.

Politics was the province of mundane practical affairs in which the higher religions had implicated themselves with the most conspicuously disastrous results; but other provinces could furnish further illustrations. A censorious Christian critic might point out that Islam had been saddled by her founder not only with the political incubus of the Temporal Power but with the social incubus of Polygamy⁸ and the ritual incubus of the adoration of the fetish animating the Black Stone; and a censorious Muslim critic might retort by counter-charges in kind against Christianity and the other living higher religions. If it was true that Polygamy had been picked up by Islam from the social heritage of 'the Times of Ignorance' in a barbarian Arabia, was it not also true that

⁶ See V. v. 646-712, *passim*.

⁷ See IV. iv. 512-84.

⁸ An apologist for Islam might reply, in defence, that an unlimited polygamy had been the established practice in the social environment into which the Prophet had happened to be born, and that he had reformed this existing social institution, so far as the weakness of the flesh would allow, by restricting the number of a man's lawful wives to four (making a personal exception for himself, and allowing to everybody any number of concubines). This apology would raise the question whether it is expedient to reform an undesirable custom at the price of consecrating it.

the likewise undesirable social institution of Caste had been picked up by Hinduism from the Indic Civilization,¹ and the idolatrous rite of image-worship² by the Mahāyāna from Hinduism and by Christianity from Hellenism? And (our Muslim critic might add) was not the Eucharist itself, which was the distinctive and fundamental sacrament of the Christian Church, a relic of Man's pre-Christian worship of his domesticated food-supply?³

These stones that lay so ready to the hand of a polemical champion of each of the higher religions, if he chose to put his own glass windows in jeopardy by breaking his neighbour's, were so many mutual danger-signals which ought to move the ecclesiastical authorities in all the churches to show the humility that was required of them; and the requirement was that they should humbly renounce dominion over provinces of practical life, and likewise of intellectual theory, in which Religion had no legitimate title to lay down the law.

A Common Endeavour

If Religion and Science could each acquire humility, and retain self-confidence, in the spheres in which, for each of them, self-confidence and humility were respectively in place, they might then find themselves in a mood that would be propitious for a reconciliation; but a propitious state of feeling, though it is an indispensable condition for successful action, is not an effective substitute for action itself; and, if a reconciliation was to be achieved in deed, the parties must seek it through some joint endeavour.

This psychological truth had been recognized in the past by the parties to the encounters between Christianity and an Hellenic philosophy and between Hinduism and an Indic philosophy. In both these encounters, as we have seen, a conflict had been arrested by the pacificatory act of giving theological expression to religious ritual and myth in philosophical terminology; and the impulse to take action had in itself been well inspired; but, as we have also seen, the particular line of action actually taken had, in both these cases, been an aberration which had failed to bring a true and lasting peace because it had taken its cue from a false diagnosis of the relation between spiritual and intellectual truth. It had proceeded on the mistaken assumption that spiritual truth could

¹ See IV. iv. 229-32.

² The votaries of religions which had admitted the use of images into their liturgy might contend—as, indeed, they had contended—that images could be used as aids to the worship of God without becoming objects of worship in themselves. The iconoclast's reply would be that this was a theoretical possibility which had seldom been achieved in practice.

³ A Christian apologist might reply, in defence, that this antique rite of communion with a god incarnate in material food produced by human labour had been the established practice in the social environment in which Christianity had happened to arise. It had survived there as the fundamental sacrament in the worship of Tammuz and his doubles, Adonis and Osiris, and in the Hellenic mysteries of Zagreus, Triptolemus, and Dionysus. Christianity had etherialized this existing ritual institution, as far as the weakness of the flesh would allow, by transfiguring its originally material meaning into a spiritual one. The abortive higher religions from which this sacrament had been taken over by Christianity had already travelled some distance along this road. And was this not the only known avenue to spiritual enlightenment? Were not Man's highest spiritual ideas all imaginative applications of familiar material facts to the mysterious realities of the Spiritual Universe?

be formulated in intellectual terms. In a twentieth-century Westernizing World the Heart and the Head would be well advised to take warning from this historic failure of a previous attempt of theirs to achieve a reconciliation on erroneous lines.

Even if it were psychologically feasible, by agreement, to discard the classic theology of the four living higher religions and to substitute for it a new-fangled theology expressed in terms, not of an Hellenic or an Indic philosophy, but of a Modern Western Science, a successful achievement of this *tour de force* would merely be a repetition of a previous error which would invite the same nemesis. A scientifically formulated theology (if such could be conceived) would be as unsatisfying and as ephemeral as the philosophically formulated theology that was hanging like a millstone round the necks of Buddhists, Hindus, Christians, and Muslims in the year A.D. 1952. It would be unsatisfying because the language of the Intellect is an inadequate medium for conveying the insight that the Soul acquires when it has been 'caught up to the third heaven' and has 'heard unspeakable words, which it is not lawful for a man to utter.'¹ It would be ephemeral because it is one of the virtues of the Intellect not to rest on its oars but ever to be striving to increase its knowledge of the Truth on its own level and to re-articulate the whole body of existing intellectual knowledge in the light of each new acquisition. In a Western World the writer's generation had seen the entire *corpus intellectuale* of Modern Western scientific thought subjected to a revolutionary reorganization as a result of the two discoveries of the theory of relativity and the structure of the atom. A theology expressed in terms of some current system of philosophy or science that was bound, *ex officio*, to be superseded,² would stand con-

¹ 2 Cor. xii. 2 and 4.

² In this passage, as elsewhere in this Study, the writer linked Philosophy with Science, because he believed that every system of philosophy was a *Weltanschauung* derived from the body of scientific knowledge current at the time and place at which the particular system of philosophy had been formulated. Believing this, he believed that philosophies changed, and were bound to change, in response to changes in the field of Science. This belief in the dependence of Philosophy on Science is challenged by Mr. Martin Wight. 'Modern Science', he comments, 'proceeds by the elaboration, testing and discarding of hypotheses; Philosophy does no such thing—least of all does Metaphysics. Thus Newton's hypotheses have now been replaced by Einstein's, because the latter explain observed phenomena more satisfactorily; but there is no sense in which Kant has replaced Plato, or Bergson has replaced Anselm. Their relationship with one another is not a relationship of progress and supersession, but of facets of a single truth, soundings in a single ocean, portraits of a single sitter. Your own copious quotation from Plato in this Study is evidence that philosophies are not "bound *ex officio* to be superseded". "The bickerings of philosophic sects are an amusement for the foolish; above these jarrings and creakings of the machine of thought there is a melody sung in unison by the spirits of the spheres, which are the great philosophers. This melody, *philosophia quaedam perennis*, is not a body of truth revealed once for all, but a living thought whose content, never discovered for the first time, is progressively determined and clarified by every genuine thinker" (Collingwood, R. G.: *Speculum Mentis* (Oxford 1924, Clarendon Press), p. 13). There is no important sense in which Theology expresses itself in terms of "some current system of science": Paley's God the Watchmaker, Whitehead's God the mathematician, and the Modernist churchman's God the evolutionary force, if they would be examples of what you mean, are not serious or significant contributions to Theology. But the association between Theology and Metaphysics is, of course, extremely close; Theology must always borrow its expression in part from the imperishable armoury of philosophical equipment; and every great theologian, even if he seems as revolutionary as Aquinas *vis-à-vis* Augustine, or Luther *vis-à-vis* Aquinas, or Calvin *vis-à-vis* Luther, or von Hügel *vis-à-vis* official Neo-Thomism, or Karl Barth, *vis-à-vis*

demned to as swift a collapse as the house that a foolish man built upon the sand.¹

What then, should the Heart and Head do to be reconciled in the light of the monumental failure of their previous attempt to build a common platform for themselves in the shape of Theology? Was there any opening in the Westernizing World of A.D. 1952 for a combined operation in a more promising direction? At that date the imagination of Western Man was still obsessed by the mounting triumphs of Physical Science, which had recently been crowned by the supreme intellectual achievement of dissecting the structure of the atom. Yet, if it were true, as has already been suggested in this chapter, that a mile gained in the progress of Man's control over Non-Human Nature is of less importance to him than an inch gained in the enhancement of his capacity to deal with himself and with his fellow men and with God, then it was conceivable that, of all Western Man's achievements in the twentieth century of the Christian Era, the feat that would loom largest in retrospect in the epimethean view of Posterity might be the breaking of new ground in the field of insight into Human Nature.

That century was witnessing the ironical spectacle of Man standing appalled in face of his latest intellectual success, and the prospect that was terrifying and dispiriting him had been conjured up, not by anything in his newly won mastery of the atom, but by something in his age-old experience of himself. This experience told him, in accents too forcible to be ignored, that he could not trust himself to refrain from using the 'know-how' of the technique for splitting the atom for his customary purpose of forging a weapon to wield against his fellow men, and his scientific knowledge told him no less plainly that, when a weapon of this unprecedented potency had fallen into an unregenerate Humanity's hands, the wages of the sin of War might be the death of the Race.² Where, in these appalling circumstances, was Man to look for access to the life that is the gift of God?³ A gleam of light might be caught in a passage from the shrewd pen of a contemporary English poet.

No more across the Ocean ships return
Fresh from the ends of Earth, the globe astern,
Homeward for Europe's tiny corner bound,
Tense with the tidings of a world new-found . . .
Yet even so, in spite of every change,
One world remains where Fancy still may range,
Remote, mysterious-sea'd, uncertain-shored,
And only recently by men explored.

Classical Lutheranism, can be seen in retrospect as having taken his place in a melody sung in unison, and as a contributor to *theologia quaedam perennis*.⁴

The writer would agree, of course, that Theology was an expression of Religion in terms of Philosophy, and this was the vice of Theology as he saw it, because he believed, with Collingwood, that Philosophy (like Science) 'is progressively determined and clarified', and therefore also believed that each successive formulation of Philosophy, as well as Science, was ephemeral. The great philosophers had been great in virtue of being also poets and prophets; and it is Plato the poet and prophet, not Plato the philosopher, whose imperishable words are copiously quoted in this Study.

² Rom. vi. 23.

³ Ibid.

A world of phantom shapes, fear-haunted mists,
 Sailed not by seamen but psychologists,
 Without Equator, latitude or Pole,
 The veiled, vague chaos of the human soul.¹

The sudden entry that had been made by the Western scientific mind into this realm of Psychology during the generation in which those lines had been written had been a by-product of two world wars waged with weapons that were capable of producing shattering effects on the Psyche, though their ravages were only the child's play of a pre-atomic Western Science. Thanks to the unprecedented clinical experience provided by these mental derangements that had been inflicted by two collective Western crimes, the Western Intellect had desecrated the subconscious depths of the Psyche and, in the act, had acquired a new conception of itself as a will-o'-the-wisp hovering over the surface of this unplumbed psychic abyss.²

Considering Man's proneness to identify with God Himself any work of God that Man, in the exercise of his puny prowess, has newly discovered or newly mastered,³ it could be augured that the Modern Western scientific mind, after having followed the Hellenic school of philosophy for three Cartesian centuries in mistakenly identifying God with the conscious rational superstructure of the Psyche, might be led astray by its portentous discovery of a psychic underworld into exchanging an Hellenic error for an Indic one and following in turn the Indic school in mistakenly identifying God with the Psyche's subconscious irrational abyss.⁴ Yet it would be as vain for Science to hope to find God in the Subconscious as it would be needless for Religion to fear to lose Him there.

'Behold, the Lord passed by, and a great and strong wind rent the mountains and brake in pieces the rocks before the Lord; but the Lord was not in the wind; and after the wind an earthquake, but the Lord was not in the earthquake; and after the earthquake a fire, but the Lord was not in the fire.'⁵

Nor, again, had the Lord ever been in—in the sense of being contained in, and so being identical with—the Earth from which He had given Man his sustenance, or in the Sky from which He had sent him rain, or in the Sun from which He had blessed him with light and warmth, or in the fire that Man had kindled, or in the crop that he had

¹ Skinner, Martyn: *Letters to Malaya, III and IV* (London 1943, Putnam), pp. 41 and 43.

² In making its own discovery of the realm of Psychology a Modern Western Science might prove not to have been the first Western explorer in this field; it might prove to have been merely rediscovering a realm that had already been explored and mapped in the confessional manual of a Medieval Western Christian Church.

³ See pp. 460-3 and 468-9, above, and p. 725, n. 1, below.

⁴ In the exultation of their intellectual conquest of the psychic realm of the Subconscious, the pioneers of the twentieth-century Western school of Psychology were apt to cry

We were the first that ever burst
 Into that silent sea,

without pausing to consider that Indic minds, following an intuitive line of approach, had anticipated them by some twenty-five centuries. See further, p. 725 with n. 1, below.

5 1 Kings xix. 11-12.

raised, or in the flock that he had bred, or in the tribe whose union had been his strength, or in any mansion of Man's own Psyche—either on its conscious surface or in its subconscious depths.

Twentieth-century Western minds were well enough aware that Man's Reason would serve him, with an unmoral impartiality, for good and evil purposes alike; but, in the exhilaration of their new discovery of the Subconscious, they perhaps needed a seventeenth-century mentor to remind them that this infant prodigy was likewise morally ambivalent.

'Le Cœur aime l'Être Universel naturellement et soi-même naturellement, selon qu'il s'y adonne; et il s'adurcit contre l'un ou l'autre à son choix.'¹

The Subconscious is indeed a child, a savage, and a brute beast which is at the same time also wiser, more honest, and less prone to error than the Conscious Self. The Subconscious is one of those statically perfect works of creation that are the Creator's 'stopping places',² whereas the Conscious Human Personality is an infinitely imperfect approximation towards a Being of an incommensurably higher order, who is Himself the maker of both these diverse but inseparable organs of the Human Psyche. Yet even the least ungodlike of God's creatures falls as immeasurably short of the divine stature of its Maker as the broadest span of the Jersey marshes falls short of the breadth of the Atlantic Ocean; and, when the Human Spirit has both caught the light of Human Consciousness and explored the darkness of the Human Psyche's subconscious depths, it is still as far as ever from having beheld the Beatific Vision of a Creator whose infinite being is never confined to any of His momentary stopping places, and whose ubiquitous presence always reveals itself behind and beyond each of His innumerable works.

'Whither shall I go then from Thy spirit? Or whither shall I go then from Thy presence?

'If I climb up into Heaven, Thou art there; if I go down to Hell, Thou art there also.

'If I take the wings of the morning and remain in the uttermost parts of the sea,

'Even there also shall Thy hand lead me, and Thy right hand shall hold me.

'If I say "Peradventure the darkness shall cover me", then shall my night be turned to day.

'Yea, the darkness is no darkness with Thee, but the night is as clear as the day; the darkness and light to Thee are both alike.'³

If Western minds in the twentieth century of the Christian Era were to have discovered the Subconscious merely to find in it a new object for idolatrous worship,⁴ they would be placing a fresh barrier between themselves and God⁵ instead of seizing a fresh opportunity to draw

¹ Pascal, Blaise: *Pensées*, No. 276, according to Brunschvicg's arrangement.

³ Ps. cxxxix. 6-11, as in *The Book of Common Prayer*.

⁴ See pp. 460-3 and 468-9, above, and p. 725, n. 1, below.

⁵ The worship of the Subconscious would be an impoverishment of the vision of God as Christus Patiens. An incarnate god identified with the subconscious element in the Human Psyche would lose his full humanity and become non-moral (like the Hindu gods and the Olympians) in becoming impersonal (like the deified forces of Nature and their summation in the perfunctory God of the Philosophers).

nearer to Him. The opportunity was there; for, at each previous discovery or mastery of a formerly unknown or untamed creature which Man had duly recognized as being, not the Creator, but another masterpiece of His handiwork, Man had, in the intellectual act of spiritual liberation, won a possibility of learning more about God as well, and of thereby entering into closer communion with Him. Man had always been thus rewarded for this lawful exercise of a dominion over his fellow creatures which had been conferred on Man by a Godhead who was both their creator and his; and an Alexandrian Hellenic philosopher of the allegorizing school—a Jewish Philo or a Greek Hypatia—might have found an intimation of this truth in the aetiological myth of Jacob's wrestling-match with the *jinn* at Peniel¹ and in the fairy-story of the kidnapping of Proteus on Pharos by Menelaus and his men.²

'With a shout we threw ourselves upon him and pinioned him in our arms; and, sure enough, the old fellow started to play his sly tricks. First of all he turned himself into a lion with bushy mane, and next into a serpent, a leopard and a mighty boar; and, before he had finished, he had changed into drenching water and into the towering foliage of a tree. But all the while we held on like grim death without relaxing, till at last the uncanny old fellow grew tired of it.'³

When Proteus was convinced, at last, that he could not wriggle out, he resumed his original form and gave Menelaus the information that he wanted;⁴ and Jacob's mysterious antagonist likewise gave Jacob the blessing for which Jacob asked when the *jinn* was convinced that his human adversary had the strength to hold him, if he chose, till they were overtaken by the breaking of the day. A Philo might have interpreted the *jinn* as a symbol of Nature's potency, with which Man cannot venture to grapple without risk to his own integrity; an Hypatia might have interpreted Proteus as a symbol of the same Nature's infinite variety; but both, if they had struck out this particular line of interpretation,⁵ would have declared, with one accord, that it was Nature, not the

¹ Gen. xxxii. 24-32.

² *Odyssey*, Book IV, ll. 351-570.

³ *Ibid.*, 454-60.

⁴ The price that Man has to pay for this acquisition of a scientific knowledge of Nature is eloquently appraised by a writer in *The Times Literary Supplement*, 17th August, 1951, p. 514:

'Primitive Man, it is to be supposed, did not feel lonely in his environment: however cruel and terrifying it might sometimes be, it was at least something akin to himself, something he could intuitively understand—could influence and propitiate. But on Modern Man the gates of Eden have closed. The more he knows of the world around him the less he understands it. Nature is no longer kind or unkind, no longer amenable to human persuasion, but a soulless problem in higher mathematics; and there are times when one re-echoes in an even deeper sense Wordsworth's lament:

Great God! I'd rather be
A pagan suckled in a creed outworn—
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreathèd horn.'

⁵ Philo does not, in fact, take this line in any of the seven passages in which he offers a symbolic interpretation of this episode of the Book of Genesis (chap. xxxii, vv. 24-32), according to the index of passages, cited by him from the Old Testament, that is to be found in vol. vii of Cohn, L., and Wendland, P.: *Philonis Alexandrini Opera Quae Super-sunt* (Berlin 1896-1926, Reimer, 7 vols.). The passages in question are: *De Ebrietate*, chap. 20 (Cohn and Wendland's edition, vol. ii, p. 185, ll. 11-13); *De Mutatione Nominum*,

God of Nature,¹ that was at grips with the human hero of a philosophic folk-tale. Hypatia would have appealed to the unimpeachable testimony of Proteus' own daughter Eidothea, as evidence that this immortal oracle of exact science was not the Lord God Poseidon, but was merely Poseidon's underling, 'the Old Man of the Sea';² and Philo would have pronounced Jacob to have been in error in inferring, from his antagonist's refusal to reveal his name, that he had 'seen God face to face'.³ Had not Jacob confuted his own conjecture by living to tell the tale and putting it on record that his life had been preserved? For had not God Himself said to Moses: 'Thou canst not see My face, for there shall no man see Me and live'?⁴

*The Fundamental Unity of Truth*⁵

If Science and Religion could seize their opportunity of drawing nearer to God by jointly seeking to comprehend God's protean creature the Psyche in its subconscious depths as well as on its conscious surface, what would be the rewards that they might expect to win if success were to crown such a joint endeavour? In this spiritual adventure the prize would indeed be splendid and the hope indeed be great;⁶ for the Subconscious, not the Intellect,⁷ is the organ through which Man lives his spiritual life for good or evil. It is the fount of Poetry, Music, and the Visual Arts, and the channel through which the Soul is in communion with God when it does not steel itself against God's influence. In this enthralling voyage of spiritual exploration the first objective would be to seek insight into the workings of the Heart; for 'le Cœur a ses raisons que la Raison ne connaît point'.⁸ The second objective would be to explore the nature of the difference between rational truth and intuitive truth, in the belief that each of them is genuine Truth—though each only in its own sphere, and only as far as it goes. The third objective

⁶ Robert Bridges, in *The Testament of Beauty*, Book I, ll. 148-61 and *passim*, has expressed what the writer of this Study is trying to say here.

⁷ Plato: *Phaedo*, 114 c, quoted in V. vi. 168.

⁸ The thesis that Man has become *Homo Sapiens* incidentally to becoming *Homo Faber* has been propounded by Henri Bergson in *L'Évolution Créatrice* (24th ed.: Paris 1921, Alcan), chap. 2, pp. 163-79:

'L'instinct est, par excellence, la faculté d'utiliser un instrument naturel organisé. . . . Mais l'intelligence est la faculté de fabriquer des instruments inorganisés, c'est-à-dire artificiels. . . . Nous tenons l'intelligence humaine pour relative aux nécessités de l'action. Posez l'action, la forme même de l'intelligence s'en déduit. . . . Partons donc de l'action, et posons en principe que l'intelligence vise d'abord à fabriquer. . . . Notre intelligence, telle qu'elle sort des mains de la nature, a pour objet principal le solide inorganisé. . . . Elle est la vie regardant au dehors, s'extériorisant par rapport à elle-même, adoptant en principe, pour les diriger en fait, les démarches de la nature inorganisée. De là son étonnement quand elle se tourne vers le vivant et se trouve en face de l'organisation. Quoi qu'elle fasse alors, elle résout l'organisé en inorganisé, car elle ne saurait, sans renverser sa direction naturelle et sans se tordre sur elle-même, penser la continuité vraie, la mobilité réelle, la compénétration réciproque et, pour tout dire, cette évolution créatrice qui est la vie. . . . L'intelligence est caractérisée par une incompréhension naturelle de la vie.'

⁸ Pascal, Blaise: *Pensées*, No. 277, according to Brunschvicg's arrangement.

would be to seek to strike the underlying rock of fundamental Truth on which rational and intuitive truth alike must be founded. And the final objective, in striving to strike rock-bottom in the psychic cosmos, would be to attain to a fuller vision of God the Dweller in the Innermost. In the present Study we cannot aspire to do more than follow our pair of explorers—if Science and Religion can be imagined as setting out hand in hand—on the first stages of this new quest for the *Visio Beatifica*.¹

The warning, so unfortunately ignored by well-intentioned theologians, that 'it hath not pleased God to give His people salvation in dialectic',² is one of the refrains of the Gospels:

'Jesus said: Suffer little children, and forbid them not, to come unto me; for of such is the Kingdom of Heaven. . . . Verily I say unto you: Except ye be converted and become as little children, ye shall not enter into the Kingdom of Heaven. Whosoever, therefore, shall humble himself as this little child, the same is greatest in the Kingdom of Heaven. And whoso shall receive one such little child in my name, receiveth me. But whoso shall offend one of these little ones which believe in me, it were better for him that a millstone were hanged about his neck and that he were drowned in the depth of the sea.'³

From the standpoint of the Reason, the Subconscious is indeed a child-like creature, both in its humble-minded attunedness to God, which the Reason cannot emulate, and in its undisciplined inconsequence, which the Reason cannot approve.

'The wind bloweth where it listeth, and thou hearest the sound thereof, but canst not tell whence it cometh and whither it goeth.'⁴

Conversely, in the sight of the Subconscious, the Reason is a heartless pedant who has purchased a miraculous but superfluous command over Nature at the sinful price of betraying the Soul by allowing her primordial vision of God to fade into the light of common day.⁵ 'Thou madest him to have dominion over the works of Thy hands; Thou hast put all things under his feet';⁶ yet what an insignificant fragment of God's creation it is that the Reason manages to catch in the clumsy crab-claws

¹ Mr. Martin Wight comments: "These three objectives of "seeking insight", "exploring the difference between rational truth and intuitive truth", and "seeking the underlying . . . fundamental truth" appear to the reader to be objectives in which, as with all human objectives, the Intellect and the Intuition are equally concerned. If this supposed reconciliation between "Reason" and "the Subconscious" means anything at all, it is a reconciliation that must be purveyed or communicated to Mankind in general in some systematized and stated formulation; such a formulation is the proper work of Reason itself; and it will be open to all the criticisms that you level against Theology."—"Indeed it will", would be the present writer's reply, 'and that is why I have set my face (see pp. 494-5, above) against the precipitation of a new theology through a fresh attempt to formulate in the language of Reason the truths of Poetry and Prophecy. I do not accept your postulate that a reconciliation between Reason and the Subconscious must be communicated by the Reason in some systematized formulation. Plato, for example, scrupulously refrained from attempting this. He yokes Reason and Intuition to his winged chariot side by side, without ever trying to disguise either one of them in any trappings that belong to the other. In my belief it is because he drives this pair of horses in double harness that he succeeds in flying so high. I appeal to Plato's example.'

⁵ Wordsworth: *Intimations of Immortality from Recollections of Early Childhood*.

⁶ Ps. viii. 6.

of its categories within the wavering framework of Space-Time! 'There are more things in Heaven and Earth,' exclaims the Subconscious to the Reason, 'than are dreamt of in your philosophy';¹ and she thanks and praises God for having given to her lowly self the mission of defending what the Reason has abandoned.

'Out of the mouths of babes and sucklings hast Thou ordained strength because of thine enemies, that Thou mightest still the enemy and the avenger.'²

Yet in truth the Reason is not, of course, the enemy of God, any more than the realm of the Subconscious is, in truth, out of Nature's bounds; for the Reason and the Subconscious alike are God's creatures. Either has its own appointed field and task, and they need not scandalize one another if they cease to trespass.³ Theology, which is the Reason's misguided attempt to state intuitive truth in terms of intellectual truth, is the counterpart of magic, which is a misguided attempt of the Subconscious to usurp the Reason's task of establishing Man's dominion over Non-Human Nature. These reciprocal trespasses are no doubt partly traceable to a hybris which is one of the symptoms of Original Sin, and which can only be kept in check by an unceasing spiritual travail; but there was another cause of confusion which the Reason and the Subconscious, between them, had it in their power to remove by co-operation.

Owing to the poverty of Man's mental equipment up to date, these two departments of the Psyche had been constrained to use one language to express two kinds of truth relating to different aspects, planes, and dimensions of Reality; and here lay the remediable cause of the insoluble and estranging verbal controversies that had arisen between Science and Religion over, for example, the Real Presence of a *Latens Deitas* in the consecrated elements of bread and wine in the rite of the Eucharist and over the Virgin Birth of a God Incarnate who had been conceived by the Holy Ghost. In a Hellenizing World in the first century of the Christian Era there was a traditional usage of words for describing the spiritual experience of the Soul's communion with God in and through the rite of sacramental eating and drinking. The God who

'bringeth forth grass for the cattle and green herb for the service of men, that He may bring food out of the Earth, and wine that maketh glad the heart of Man, and oil to make him a cheerful countenance, and bread to strengthen Man's heart',⁴

was traditionally described as animating these His creatures when they were eaten by Man in a rite in which Man's aim was to commune with his Maker. In the same world in the same age there was another traditional usage of words for describing the spiritual experience of

¹ Shakespeare: *Hamlet*, Act I, scene v, l. 162.

² Ps. viii. 2, as in *The Book of Common Prayer*.

³ A Catholic friend of the writer's comments: 'Science should have its own field to itself and should recognize that the laws which it finds are God's laws and that He can do with them as He wills. While Science and Revealed Truth are on different planes they will not contradict one another; each can safely affirm what is certainly truth in its own sphere with no fear that they will be at variance. In the past, both Science and Religion have exceeded their limits.'

⁴ Ps. civ. 14-15.

encountering a man through whose personality God's light streamed into his fellow men's souls, not darkly, as through a glass,¹ but undimmed, as through an open window. Such a human soul divine (*θεῖος ἄνθρωπος*),² whose appearance in This World had given light to them that sat in darkness and in the shadow of death,³ was traditionally described as being a Son of God by a human mother.⁴

Does not this mythological use of language aptly express the truth of the Heart?⁵ And, if it does so, is not this the most important of the alternative uses to which words can be put? Which is the more significant truth about bread and wine? The spiritual truth that, in the Eucharist, they bring the Soul into communion with God? Or the scientific truth that they keep a physical organism alive in virtue of such-and-such tissue-repairing and such-and-such energy-giving ingredients? And which is the more significant truth about the birth of a new man into the World?⁶ The spiritual truth that, through the tender mercy of our God, the dayspring from on high hath visited us?⁷ Or the scientific truth that an embryo has been conceived in such-and-such a way by sexual intercourse, and has passed through such-and-such physical metamorphoses between conception and birth? In the realm of spiritual values, bread and wine exist for the sake of the Eucharist, not of the food-supply, and conception and birth take place for the sake of the Incarnation, not of man-power. And, if Science, using the same words in a different sense of her own, declares that the spiritual usage of them is, if literally intended, untrue, and, if symbolically intended, unscientific, Religion can have the last word if she is content to retort that, for her, the scientific meaning is trivial and irrelevant. She does not expose her mythological expression of spiritual truth to any damaging scientific attack unless she stakes the perverse theological claim that her truths are true in the scientific sense as well as in the spiritual.⁸

The first step towards a reconciliation between Religion and Science would be a mutual recognition that either of them has a truth of her

¹ 1 Cor. xiii. 12.

² See Bieler, L.: *Θεῖος Ἄνθρωπος* (Vienna 1935-6, Höfels, 2 vols.).

³ Luke i. 79.

⁴ For the myth of the encounter between the Virgin and the Father of her Child, see II. i. 271-2; V. vi. 267-75; and p. 464, above.

⁵ This question appears to the writer to be answered in the affirmative in the following comment by a Catholic friend of his: 'The revealed truths of the Christian Faith are in some respects about things that we could not know [solely by the light of our human intellectual powers]: Grace, the Trinity, Redemption. A full comprehension of these truths is beyond the powers of our intelligence, and part of their meaning can only be understood in the way of analogy. This will continue to be so as long as men are men. Only God can lift us out of the use of images, for that is our way of knowing. We must not forget the poets, who are among the greatest of men; their way is the way of symbolism throughout. The danger of this way is that the image may be mistaken for the reality behind. The right way of meeting this danger is, not to throw the image away, but to use it only as a means.'

⁶ John xvi. 21.

⁷ Luke i. 78.

⁸ 'All religious propositions are symbolic, but come to be taken literally. For literal language and the language of fact are identical. This is everywhere the trap which lies in the path of the religious consciousness. It mistakes its own utterances for literal statements of fact. Its doom is then sealed. For always in the end it turns out that the alleged facts are not facts, but fictions. And the discovery of this, whether by Science, or Philosophy, or merely by Common Sense, is the triumph of Scepticism' (Stace, W. T.: *Time and Eternity* (Princeton 1952, University Press), p. 132).

own which cannot be taken in the sense of the other truth on the strength of the verbal accident that the same language has to be used for conveying these two different meanings. This would be the first step, but it could not be the last, for, if Truth were not reducible to unity, God would not be accessible to Man; and this would be in contradiction with Man's experience.¹ Moses did not see God's face on Mount Sinai, yet he did come down from the mount with the tables of testimony in his hand;² Elijah did not feel God's presence in the wind or in the earthquake, nor did he see it in the fire, yet he did hear the still small voice³ which spoke to him after the fire and the earthquake and the wind had expended themselves. If Truth is ultimately one, and if the diversity of spiritual and scientific truth should prove not to be reducible to unity by the naïve method of trying to interpret one of the two in the sense of the other, the ultimate unity must be sought on some third plane—distinct from both the planes of truth so far known to Mankind.

This hypothetical underlying unitary truth had so far been beyond the range of Man's spiritual vision; and it seemed unlikely that he would even begin to apprehend it till he had advanced much farther than he had progressed so far in his understanding of both the Reason and the Subconscious. At a date which was perhaps less than six thousand years removed from the date of the first emergence of the earliest of the civilizations, Man was still barely on the threshold of his knowledge of himself; and this dark jungle would be harder for Man's intelligence to penetrate than the great open spaces of Non-Human Nature where the Intellect found itself at home⁴ and where in the past it had overrun one province after another in a continual succession of sweeping conquests. Nor, in the field of self-knowledge, would the utmost intellectual prowess avail by itself to bring Man to his objective; for spiritual truth cannot be divined except through spiritual experience, and the dumb Heart cannot express what it has learnt through suffering till the liberating word is uttered by a prophet inspired with the gift of tongues. But neither the revealing experience nor its prophetic interpretation could be whistled for at the convenience of a hard-pressed generation; and, pending the fuller enlightenment which might come to Man in God's time, but which was not at Man's command, a belief in the existence of bed-rock Truth must rest on the faith which 'is the substance of things hoped for, the evidence of things not seen'.⁵ The grounds for this faith which passes understanding could be indicated in a simile.

Elemental truths might be likened to high buildings whose weight is so crushing that the structure cannot stand without being founded on rock. When, standing on the heights overlooking Sandy Hook, we see on the horizon the sky-line of New York, we can confidently infer from

¹ 'If one sticks to the "commonsense" attitude, of course it seems purely pedantic and sophistical to discuss the relation of poetical to historical truth, but no one can have done more than a trifle of philosophical thought without discovering that there is such a thing as poetic truth, that it is not the same as historical truth, and that the relating of the two is an extremely complicated matter' (William Temple, in a letter quoted in Iremonger, F. A.: *William Temple, Archbishop of Canterbury* (London 1948, Cumberlege), p. 466).

² Exod. xxxiii. 23 and xxxiv. 29.

⁴ See pp. 500-1, above.

³ 1 Kings xix. 12.

⁵ Heb. xi. 1.

our first glance the presence of rock at the distant sky-scrapers' base. On Manhattan Island the rock on which these giant towers are founded crops out on the surface, visible to the eye when we view the *terrain* at close quarters. But what about the high buildings in Chicago? On the shore of Lake Michigan the visible surface of the Earth is composed, not of solid rock, but of softer substance—alluvium or gravel or clay—yet the buildings there tower up to heights that rival the altitudes of their sisters in New York. What is the secret of the Chicagoan architects' apparent achievement of the impossible feat of building Towers of Babel on the sand? The secret is that these high buildings in Chicago rest, not on the visible surface soil—which would indeed be incapable of supporting them—but on concrete piles which are driven down through softer strata till they strike the rock, at whatever depth it may lie. The depth is variable, for the invisible rock underlying Chicago, like the visible rock that crops out in New York, is capriciously irregular in its configuration, so that one pile may strike it at no more than 20 feet below the surface, and another at no more than 70 feet, while a third may have to probe down no less than 200 feet before finding rest for the sole of its foot.¹ In the imagery of this simile, Truth might be likened to a house of many mansions with a rock-based pile supporting each. The buried pinnacle of rock on which rational truth is founded may be situate not very far below the surface, while spiritual truth may be based on the rock-bottom of an abyss; but, however great the difference in the level may be, the foundations of both kinds of truth alike go down to the rock, and at either level it is the same rock, living yet invisible, that bears the weight on its atlantean shoulders.²

If the eye of Faith could thus divine the presence of a Unitary Truth founded on the rock but buried deep below the surface, how were the Heart and the Head to pursue their common enterprise of striving to reach and grasp this hidden treasure? Two points, at least, could be taken as certain: the characteristic and peculiar gifts of both organs must be brought into play if the quest was to have any prospect of success, and this indispensable co-operation would only be possible in virtue of the constant exercise of a mutual charity; 'for we know in part and we prophesy in part,'³ but 'charity never faileth'.⁴

The relation between the two organs of the Psyche might be likened to that between a human herdsman and a powerful and wayward yet domesticable and serviceable animal. Neither man nor beast can truly afford to do without his fellow creature; for the beast remains an aimless wanderer in the wilderness so long as he does not accept human guidance, while the man remains a puny plaything of Nature so long as he

¹ Gen. viii. 9.

² Mr. Martin Wight justly comments: 'This conclusion, and the simile in which it is expressed, is, of course, at odds with the New Testament, whose writers were compelled to assert that the rock had once for all cropped above the surface on the historical soil (1 Cor. x. 4) and had provided the foundation for the building of the Kingdom of God (Eph. ii. 20)—that the Eternal had once for all irrupted into the temporal, the Meta-historical into the historical—and that the "hypothetical underlying unitary truth", which you project "at present beyond our range of vision" (p. 504, above), had once for all appeared in human flesh: "I am . . . the Truth" (John xiv. 6).' Yet the scientific truth explored by the Reason is, in fact, independent of the spiritual truth revealed in Christ.

³ 1 Cor. xiii. 9.

⁴ 1 Cor. xiii. 8.

does not command the beast's services. How are they to co-operate? They will never succeed so long as either imagines that he can dominate the other by sheer force; for the Subconscious, like some camel, mule, or goat, is merely stung into a maliciously obstinate contrariness by a touch of the whip, while, conversely, if the Subconscious wantonly takes the offensive against the Reason in seeking to overwhelm it by some demonic exertion of its own brute strength, it is apt not to break the Will but to steel it. In the everlasting intercourse between the two members of this indissoluble pair of psychic partners, aggression on either side can produce nothing but a mutual frustration. When Mithras has slain his bull, he still has the carcass on his hands and the murder on his conscience. A better way is indicated in a Zen Mahayanian Buddhist parable of the drama of the Soul that is presented in visual form in divers versions of 'the Ten Oxherding Pictures'.¹ In this encounter between beast and man the victory is won in the end not by Hêraklês' muscles but by Orpheus' music.

Riding on the animal, he leisurely wends his way home;
Enveloped in the evening mist, how tunefully the flute vanishes away!
Singing a ditty, beating time, his heart is filled with a joy indescribable!
That he is now one of those who know, need it be told?²

(d) THE PROMISE OF THE CHURCHES' FUTURE

1. *Man's Fellowship with the One True God*

If a generation born into the twentieth century of the Christian Era might dare to look forward to a day when Heart and Head would have been reconciled by a unison of charity, insight, and faith, they might also hope to persuade Heart and Head to concur in a reading of the significance of the Churches' past; and, if our findings on that point were agreed, they would provide a starting-point for entering on the last stage of our inquiry into the relation between churches and civilizations. After having found that churches are not cancers, and that they are no more than incidentally chrysalises, we have been looking into the alternative possibility that they may be a higher species of society. We cannot give our verdict on this issue without asking ourselves what light the significance of the churches' past may throw on the promise of their future.

In embarking upon this necessary yet hazardously speculative quest, we may take courage from a consideration that has already emerged.³ The chronological 'yardstick' that gives the true measure of the churches' past and future is the Time-scale established by a Modern Western Physical Science; and on this Time-scale the species of human society that we have called the higher religions was, at the time of writing, still extremely young. This meant that, in comparing the value of the higher religions with the value of the civilizations and the primitive societies, students of History midway through the twentieth century of the

² Op. cit., English translation of the poem accompanying Picture No. 6 in the first of the two versions of the series that are reproduced in this brochure.

³ On pp. 452-5, above.

Christian Era were entitled, in judging the youngest of the three species, to take account of its potentialities as well as its already harvested achievements. Their inevitably tentative judgement on this basis might be confuted by the future course of events; for of course there was no guarantee in the mere effluxion of Time that promise would be fulfilled in performance. Manifestly, error lay in wait here to ensnare observers born into this generation; yet, considering the circumstances, they must reckon themselves less likely to err by counting chickens before they were hatched than by pronouncing the eggs to be added before there had been time for incubation.

After giving ourselves this encouragement, tempered by this warning, let us ask ourselves what was the feature in a church which differentiated it from both a civilization and a primitive society and which led us to classify churches as a distinct, and higher, species of the genus in which all these three types of society were embraced. The distinguishing mark of churches was not their inclusion of dead and unborn, as well as living, human members, for a membership transcending the living generation was a feature that was common to all species; nor was the distinguishing mark of churches their inclusion of divine as well as human members, for all species of society had in common this feature likewise. The distinguishing mark of the churches was that they all had as a member the One True God—for this feature was shared by the churches with no other species of society but was common to all the churches alike, whether they regarded the personal aspect of the Godhead, through which He enters into a relation of fellowship with His creature Man, as a revelation of His essence or as an avatar, manifested to Man in a form which Man can grasp, of an Ultimate Reality that is beyond Personality. This human fellowship with the One True God, which had been approached in the primitive religions and been attained in the higher religions, gave to these certain vital virtues that were not to be found in either primitive societies or civilizations. It gave power to overcome the discord which was one of the inveterate evils of Human Society; it offered a solution of the problem of the meaning of History; it inspired an ideal of conduct which could be an effectively potent spiritual stimulus for the superhuman effort of making Human Life possible in This World; and it availed to exorcize the peril that was inherent in mimesis when this was oriented, not towards the One True God, but towards one of Man's fellow human creatures.

2. *The Promise of Overcoming Discord*

Discord is inveterate in Human Life because Man is the most awkward of all things in the World that Man is compelled to encounter; and Man has to face Man on two fronts: in the macrocosm as his neighbour and in the microcosm as himself.

'Of all tools used in the shadow of the Moon, men are most apt to get out of order';¹ and the source of this trouble becomes manifest when we put together the two facts that Man is a social animal and that Man is endowed with free will. The combination of these two elements in the

¹ Melville, H.: *Moby Dick*, chap. xlvii.

nature of Man—and both are key-elements in Human Nature—means that in any society consisting exclusively of human members there will be a perpetual conflict of wills; and this human conflict is bound to be more terrible than the blind struggle for life among non-human animals, because 'human passions are always characterised by unlimited and daemonic potencies of which animal life is innocent'.¹ Man is indeed always and everywhere the Faust that has been taken as the type of Western Man by the intuitive genius of Spengler; and, when a Faustian insatiability betrays Man's likeness to his Maker by grasping at infinity, this impact of Man's explosive vein of godlikeness upon his hidebound animal nature must produce some spiritual revolution or enormity² if it is not graced by the miracle of conversion.

Man's conversion is necessary for Man's salvation because his free and insatiable will gives him his spiritual potentiality at the risk of alienating him from God. This risk will not have beset a pre-human social animal not blessed—or cursed—with a spiritual capacity for rising above the level of the Subconscious Psyche; for the Subconscious Psyche enjoys the same effortless harmony with God that its innocence assures to every non-human creature.³ This negatively blissful Yin-state, in which the Psyche 'was without form and void, and darkness was upon the face of the deep',⁴ was broken up when human consciousness and personality were created through a Yang-movement in which 'the spirit of God moved upon the face of the waters'⁵ 'and God divided the light from the darkness'⁶ 'and divided the waters which were under the firmament from the waters which were above the firmament';⁷ for Man's Conscious Self, which can serve as God's chosen vessel for the achievement of a miraculous spiritual advance if it seeks and finds that harmony with its Creator which the Subconscious possesses *ex officio naturae*, can also condemn itself to a lamentable fall if its awareness of being made in God's image intoxicates it into idolizing itself. This suicidal infatuation (*ἄρνη*) which is the wages of the sin of pride (*ὑβρις*)⁸ is a spiritual aberration to which the Soul is perpetually prone in the unstable spiritual equilibrium which is of the essence of Human personality;⁹ and the Self cannot escape from itself by a spiritual regression into the Yin-state of *Nirvāna*. The recovered Yin-state in which salvation is to be found by Man is the peace, not of nerveless self-annihilation, but of taut-strung harmony. Psyche's task is the *tour de force* of recapturing a childlike virtue after having 'put away childish things'.¹⁰

² For the 'revolutions' and 'enormities' that are alternative possible disastrous outcomes of putting new wine in old bottles, see IV. iv. 133-7.

³ For this sense in which the Subconscious is nearer to God than the Conscious Self, see pp. 498 and 501-2, above.

⁴ Gen. i. 2.

⁵ Gen. i. 2.

⁶ Gen. i. 4.

⁷ Gen. i. 7.

⁸ See IV. iv. 245-61.

⁹ This inevitable exposure of a 'high-powered' human personality to the risk of a spiritual disaster, from which the 'low-powered' pre-human Subconscious Psyche is exempt, is a spiritual analogue of the perilousness of a road on which mechanically propelled vehicles have replaced horse-carts and wheel barrows (see III. iii. 209-12). The self-discipline that is called for in the Soul if it is to find salvation is the counterpart of the traffic-control that is required in order to make a speedway safe for life and limb.

¹⁰ I Cor. xiii. 11.

'Except ye be converted and become as little children, ye shall not enter into the Kingdom of Heaven';¹ but the Self has to achieve its childlike reconciliation with God by the manifold exertion of a god-given will to do the will of God and thereby evoke God's grace.

If this is Man's way of salvation he has a rough road to tread; for the mighty act of creation that has made Man *Homo Sapiens* has, by the same stroke, made it mortally hard for Man to become *Homo Concors*, and a social animal that is an accomplished *Homo Faber* must co-operate or perish. The disastrous social consequences of an unresolved moral contradiction which the theologians had called Original Sin were written large on the pages of History.

In virtue of Man's innate sociality, every human society is potentially all-embracing. In a previous context² we have observed that every civilization had demonstrably radiated its influence over all the rest of Mankind; and the feebler radiation of the primitive societies, which is less easy to detect, is not likely to have been less ubiquitous. This constant mutual interpenetration of social influences makes any society unstable and provisional so long as it falls short of being world-wide (as all societies of every species had hitherto fallen short in fact); but here the egocentric pull of every individual human will comes contradictorily and obstructively into play. Down to the year A.D. 1952 no human society had ever yet become literally world-wide on every plane of social activity. A secularized Modern Western Civilization had latterly attained to virtual universality on the economic plane without having achieved any comparable political or cultural success;³ and, after the shattering experience of two world wars in one lifetime, it was uncertain whether an indispensable and perhaps inevitable political unification of the World could come to pass without that grimly familiar 'knock-out blow' that had been the traditional price of oecumenical unity in the histories of civilizations of a less than literally world-wide extent.⁴

In the past this price had always proved prohibitively high; for civilizations which had arrived at political unity by this road had inflicted mortal wounds on themselves in the process; and the unification of a Westernizing World by the familiar method of military force was likely to wreak damage of an unprecedented degree of severity owing to the keying-up of the material 'drive' behind War through the triumphs of a Modern Western Technology.⁵ The relentless advance of Man's command over Non-Human Nature, since the date in the Palaeolithic Age when his technological prowess had made him lord of all creation except himself,⁶ had indeed been steadily accentuating the pressure of its challenge to Man to build for himself a society embracing the entire Human Race. But the ever-increasing urgency of this necessity had been obstinately ignored by the defiant egotism of human wills, and the efforts of civilizations to advance towards the goal of universality had been mocked by their proclivity to fall asunder on the political

¹ Matt. xviii. 3 (see IV. iv. 248-9, and pp. 501-2, above).

² In II. i. 187.

³ See I. i. 35-36.

⁴ This grave question is considered further in XII. ix. 524-36.

⁵ See IV. iv. 141-55.

⁶ See pp. 486-7, above.

plane into sovereign parochial states whose fratricidal warfare had been perhaps the most frequent cause of the breakdowns and disintegrations of civilizations up to date.¹ This self-inflicted calamity had overtaken the Western Civilization in its turn in its Modern Age, when the failure of the medieval attempt to establish a Papal *Respublica Christiana* had discredited the ideal of an oecumenical unity resting on the supremacy of the Church over the parochial states,² and when the success of the recent expansion of the West over the rest of the World had relieved the West from the pressure of hostile neighbour societies which had almost mechanically held a Medieval Western Christendom together.³

The truth is that the unity of Mankind cannot be achieved either by stitching together local communities into a pantheon of tribal deities presiding over a terrestrial conglomeration of parochial states, on the pattern of Cyrus's 'Kingdom of the Lands',⁴ or by purging Society of its primitive divine participants and making Humanity itself the Absolute, as had been attempted by Humanists of a Modern Western school.⁵ In another context⁶ we have already taken note of the paradoxical but profound truth that the most likely way to reach a goal is to be aiming not at that goal itself but at some more ambitious goal beyond it. The unity of Mankind can be achieved only as an incidental result of acting on a belief in the unity of God,⁷ and by seeing this unitary terrestrial society *sub specie aeternitatis* as a province of a Commonwealth of God which must be singular, not plural, *ex hypothesi*.⁸

This is the necessary condition because, without a harmony of wills, Society cannot maintain itself even on the most narrowly restricted tribal range, not to speak of its becoming world-wide, and the only society in which there can be a harmony of wills is one in which two or three—or two or three thousand million—are gathered together in God's name with God Himself in the midst of them.⁹ In a society including the One True God as well as His human creatures, God plays a unique part. He is a party to the relation between each human member and Himself; but in virtue of this He is also a party to the relation between each human member and every other human member, and through this participation of God, breathing His own divine love into human souls, human wills can be reconciled.¹⁰

The great gulf fixed¹¹ between 'the open society' of the Commonwealth of God and 'the closed society' that is exemplified not only in primitive societies but in civilizations, and the spiritual leap without which this gulf cannot be crossed, had been pictured by a Modern Western pioneer philosopher in a passage, referred to in an earlier context,¹² which calls for quotation here.

² See I. i. 33-34.

³ See V. vi. 8.

⁴ See V. vi. 9-16.

⁵ Matt. xviii. 20.

⁶ This reconciliation is not, of course, automatic, and indeed the intervention of the One True God in Man's struggle with himself for the attainment of social unity is a challenge which may evoke in response, not love, but a hate-inspired intolerance (see IV. iv. 222-9, and pp. 430-1, above).

¹¹ On this point see further pp. 558-9, below.

¹² In V. vi. 12.

'L'homme [a] été fait pour de très petites sociétés. Que telles aient été les sociétés primitives, on l'admet généralement. Mais il faut ajouter que l'ancien état d'âme subsiste, dissimulé sous des habitudes sans lesquelles il n'[y] aurait pas de civilisation. . . . Le civilisé diffère surtout du primitif par la masse énorme de connaissances et d'habitudes qu'il a puisées, depuis le premier éveil de sa conscience, dans le milieu social où elles se conservaient. Le naturel est en grande partie recouvert par l'acquis; mais il persiste, à peu près immuable, à travers les siècles. . . . Le naturel est indestructible. On a eu tort de dire: "Chassez le naturel, il revient au galop",¹ car le naturel ne se laisse pas chasser. Il est toujours là. . . . Habitudes et connaissances sont loin d'imprégner l'organisme et de se transmettre héréditairement, comme on se l'était imaginé. . . . Refoulé, impuissant, [l'ancien état d'âme] demeure pourtant dans les profondeurs de la conscience. . . . [et] il se maintient en fort bon état, très vivant, dans la société la plus civilisée. . . . Nos sociétés civilisées, si différentes qu'elles soient de la société à laquelle nous étions immédiatement destinés par la nature, présentent d'ailleurs avec elle une ressemblance fondamentale. Ce sont en effet, elles aussi, des sociétés closes. Elles ont beau être très vastes en comparaison des petits groupements auxquels nous étions portés par instinct. . . . elles n'en ont pas moins pour essence de comprendre à chaque moment un certain nombre d'individus, d'exclure les autres. . . . Entre la nation, si grande soit-elle, et l'humanité, il y a toute la distance du fini à l'indéfini, du clos à l'ouvert. . . .

'De la société close à la société ouverte, de la cité à l'humanité, on ne passera jamais par voie d'élargissement. Elles ne sont pas de même essence. . . . La différence entre les deux objets est de nature, et non plus simplement de degré. . . . Qui ne voit que la cohésion sociale est due, en grande partie, à la nécessité pour une société de se défendre contre d'autres, et que c'est d'abord contre tous les autres hommes qu'on aime les hommes avec lesquels on vit? Tel est l'instinct primitif. Il est encore là, heureusement dissimulé sous les apports de la civilisation; mais aujourd'hui encore nous aimons naturellement et directement nos parents et nos concitoyens, tandis que l'amour de l'humanité est indirect et acquis.

'A ceux-là nous allons tout droit, à celle-ci nous ne venons que par un détour; car c'est seulement à travers Dieu, en Dieu, que la religion convie l'homme à aimer le genre humain; comme aussi c'est seulement à travers la Raison, dans la Raison par où nous communions tous, que les philosophes nous font regarder l'humanité pour nous montrer l'éminente dignité de la personne humaine, le droit de tous au respect. Ni dans un cas ni dans l'autre nous n'arrivons à l'humanité par étapes, en traversant la famille et la nation. Il faut que, d'un bond, nous nous soyons transportés plus loin qu'elle et que nous l'ayons atteinte sans l'avoir prise pour fin, en la dépassant. Qu'on parle d'ailleurs le langage de la religion ou celui de la philosophie, qu'il s'agisse d'amour ou de respect, c'est une autre morale, c'est un autre genre d'obligation, qui viennent se superposer à la pression sociale.²

There can be no unity of Mankind without the participation of God; and, conversely, when the heavenly pilot is dropped by an insensately self-confident human crew, Society inevitably falls into a Time of Troubles—as has been testified, with an impressive conviction, by an

¹ 'Naturam expelles furcâ, tamen usque recurret' (Horace: *Epistulae*, Book I, Ep. x, l. 24).

² Bergson, Henri: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 24-25, 27-28, 288, 293, 297.

accomplished and sceptical Modern Western statesman in the light of the political experience of a lifetime ending in the failure of his attempt to engineer the restoration of a pre-Revolutionary *ancien régime*.

'La décadence des empires va toujours de pair avec les progrès de l'incrédulité. La foi religieuse, qui est la première des vertus, est précisément pour cela la plus grande des forces. Elle seule règle l'attaque et rend la résistance invincible. La foi ne peut pas diminuer chez une nation sans entraîner l'affaiblissement de cette dernière; or, la chute des états ne suit pas une progression arithmétique comme la chute des corps, elle ne tarde pas à conduire au néant.'¹

In this prophetic passage, Metternich was foreboding the 'revolution of destruction' which had duly overtaken the Western World in a subsequent generation. The suffering and shame which Western Man had brought upon himself by the sin of 'totalitarianism'² had been a painful revelation of the truth that human beings cannot live without worshipping something. When they repudiate the worship of the One True God, they swiftly relapse into a worship of Leviathan.

3. *The Promise of Revealing a Spiritual Meaning in History*

When Man is out of fellowship with God, he not only lapses into a discord which is at variance with his innate sociality; he is also tormented by a tragic crux which is inherent in his being a social creature, and which therefore presents itself the more sharply, the better he succeeds in living up to the moral requirements of his social nature, so long as he is seeking to play his part in a society of which the One True God is not also a member. This crux is that the social action in which a human being fulfils himself immensely exceeds in its range, in both Time and Space, the limits of an individual's life on Earth. *Ars longa, vita brevis*³ is a truth that is true of all the social activities of *Homo Faber*. This discrepancy is manifest in primitive societies, and it makes itself felt overwhelmingly in civilizations. Even in the most narrow-verged society the ablest, most energetic, and most fortunate individual cannot influence, or even survey, the action in which he is concerned beyond the close-drawn limits of a horizon which embraces no more than a fraction of the human actor's minimum field of action. Thus history, seen solely from the standpoint of each individual human participant in it, is 'a tale told by an idiot, signifying nothing'.⁴ But this apparently senseless 'sound and fury' acquires spiritual meaning when Man catches in History a glimpse of the operation of a One True God who is both transcendently infinite and intimately loving, and who has the power and the will to take up His human creatures into His own range of action and mode of existence,⁵ in so far as they respond to His challenging call

¹ Metternich, *Le Prince de: Mémoires*, vol. viii (Paris 1884, Plon-Nourrit), pp. 606-7. This passage, which was written in A.D. 1858, was brought to the notice of the writer of this Study by his friend and colleague Sir Charles Webster.

² The twentieth-century Western totalitarian states were 'enormities' in the sense in which the word has been used in IV. iv. 135.

³ *Ὁ βίος βραχύς, ἡ δὲ τέχνη μακρὴ, ὁ δὲ καιρὸς ὀξύς, ἡ δὲ πείρα σφαλὲρ, ἡ δὲ κρίσις χαλεπή* (Hippocrates: *Aphorisms*, i. 1).

⁴ Shakespeare: *The Tragedy of Macbeth*, Act III, scene ii, ll. 22-23.

⁵ The sense in which Man can transcend the dimensions of Space and Time by enter-

to act in This World as partners in His divine work. 'God is not the God of the dead . . . but the God of the living . . . for all live unto Him.'¹ 'For He became man in order that we might be made God.'²

'If it is true that the existence of each individual goes on elsewhere in the Unseen World after he has passed from the stage of This World, there is a curious difference in the value which each individual life here has, according as it is considered in the one or the other of its two contexts. Looked at in its earthly context, it is something which is over in a moment, and counts for almost nothing in comparison with the relatively permanent things on this planet.

Time, like an ever-rolling stream,
Bears all its sons away;
They fly forgotten, as a dream
Dies at the opening day.

Even of our own great-grandfathers few of us know more than the names, and perhaps the place where they mostly lived. England, which abides, is important, but the individual Englishmen are creatures of a day, and perish like summer flies. . . .

'But when we look at the individual life in its other context, the relative importance of things is reversed. Human life may continue on this planet for another million years, but, sooner or later, it must come to an end. From this standpoint it is England which is destined to pass away, and it is the individual whose existence continues for ever. The actor who was on the stage for a brief ten minutes was a transitory appearance, looked at in relation to the play, but the life of the actor goes on long after the play is over.'³

Thus, while a civilization may be a provisionally intelligible field of study,⁴ the Commonwealth of God is the only morally tolerable field of action; and membership in this *Civitas Dei* on Earth is offered to human souls by the higher religions; for, though these divers earthly embodiments of the *Civitas Dei* are, each of them, only partial and imperfect, they do all faithfully represent their original in offering Man membership in a society in which he will find himself in fellowship with God seen through a less dark glass than that which the primitive religions interpose. It was noteworthy that the two 'Indistic' higher religions—committed, though they were, to a philosophy which dismissed the phenomenal life of consciousness and action in This World as an illusion and condemned this illusion as an evil—had nevertheless conceded that an ultimately impersonal Reality manifests itself to Man in personal forms with which he can enter into communion, and they had

ing into communion with God is discussed further—with all diffidence in seeking to approach so great a mystery—on pp. 756–8, below.

³ Bevan, Edwyn: *Our Debt to the Past* (London 1932, British Broadcasting Corporation), pp. 10–11. Cf. eundem: *The Kingdom of God and History* (London 1938, Allen & Unwin), p. 57; *Christians in a World at War* (London 1940, S.C.M. Press), pp. 95–96.

⁴ See I. i. 17–50, and pp. 1–2, above.

brought these personal gods and bodhisattvas within Man's reach on Earth in recurrent terrestrial epiphanies (*avatars*). It was also noteworthy that Islam, which shared with Christianity the Judaic vision of an Ultimate Reality that is a Personal God, but parted company with Christianity in reaffirming Judaism's uncompromising insistence on God's 'otherness' from Man and on His undifferentiated unity, had been drawn, after all, into an approach towards the Christian view by Man's deep need for God's fellowship. As Saint Athanasius had divined, God had to come down to Man's level in order to raise Man to His; and a religion which, in vindicating God's unity, had denied the divinity of Christ, had been constrained to find an equivalent for Christ's crucifixion in the martyrdoms of 'Alī, Hasan, and Husayn, and even (in an extreme form of the Shī'ah) to transfigure these human heroes into incarnations of the Godhead.¹

Man's fragmentary and ephemeral participation in terrestrial history is indeed redeemed for him when he can play his part on Earth as the voluntary coadjutor of a God whose mastery of the situation gives a divine value and meaning to Man's otherwise paltry endeavours; and this redemption of History is so precious for Man that, in a secularized Modern Western World, a crypto-Christian philosophy of History had been retained by would-be ex-Christian rationalists.

'Because they put faith in the Bible and the Gospel, in the story of creation and in the announcement of the Kingdom of God, Christians were able to venture on a synthesis of the totality of History. All subsequent attempts of the same kind merely replaced the transcendent end that assured the unity of the mediaeval synthesis by various immanent forces that served as substitutes for God; but the enterprise remained substantially the same, and it was the Christians who first of all conceived it: namely, to provide the totality of History with an intelligible explanation, which shall account for the origin of Humanity and assign its end. . . .

"The whole Cartesian system is based on the idea of an omnipotent God who, in a way, creates Himself and therefore, *a fortiori*, creates the eternal truths, including those of mathematics, creates also the Universe *ex nihilo*, and conserves it by an act of continuous creation, without which all things would lapse back into that nothingness whence His will had drawn them. . . . Consider the case of Leibnitz. What would be left of his system if the properly Christian elements were suppressed? Not even the statement of his own basic problem—that, namely, of the radical origin of things and the creation of the Universe by a free and perfect God. . . . It is a curious fact, and well worth noting, that, if our contemporaries no longer appeal to the *City of God* and the Gospel as Leibnitz did not hesitate to do, it is not in the least because they have escaped their influence. Many of them live by what they choose to forget.'²

4. *The Promise of Inspiring an Effective Ideal of Conduct*

A human being who, in this life, breaks the bounds of Time and Space by entering into communion with God is transfigured, if the communion becomes habitual, from a savage into a saint.

¹ See pp. 718-19, 731-2, and 733-4, below.

² Gilson, E.: *The Spirit of Mediaeval Philosophy*, English translation (London 1936, Sheed & Ward), pp. 390-1 and 14-17.

'Le sauvage qui est en nous et qui fait notre étoffe première doit être discipliné, policé, civilisé, pour donner un homme. Et l'homme doit être patiemment cultivé pour devenir un sage. Et le sage doit être éprouvé pour devenir un juste. Et le juste doit avoir remplacé sa volonté individuelle par la volonté de Dieu pour devenir un saint. Et cet homme nouveau, ce régénéré, c'est l'homme spirituel, c'est l'homme céleste, dont parlent les Védas comme l'Évangile, et les Mages comme les néo-platoniciens.'¹

Such sainthood is indispensable for the maintenance of societies—even those of the pettiest and simplest and lowest kind—because even the minimum of unselfishness and determination and courage and vision that is required for making social life possible on Earth far exceeds the range of the natural altruism of a social animal.

I will not cease from mental fight,
Nor shall my sword sleep in my hand,
Till we have built Jerusalem
In England's green and pleasant land,²

is a resolution that can be taken only by a soul that, through eyes enlightened by communion with God, sees This World consecrated and illumined by God's indwelling presence. And the courage to abide by this resolution, in the face of disappointment and defeat, can be kindled only by a vision of the invincible action of God which reduces to insignificance the fickle fortunes of a desperate human battlefield.

For while the tired waves, vainly breaking
Seem here no painful inch to gain,
Far back, through creaks and inlets making,
Comes, silent, flooding in, the main.

And not by eastern windows only,
When daylight comes, comes in the light;
In front the Sun climbs slow, how slowly!
But westward, look, the land is bright.³

This ideal of conduct is inspired by the saint's communion with God, and there is no effective alternative stimulus. The ideal of the sage breaks down because it tries to make Man become, not a saint inspired by the grace of a God who is Love, but a very god in himself in virtue of his own spiritual prowess; and for Human Nature this, if it were an attainable goal, would prove an intolerable burden. The moral impracticability of the enterprise is betrayed by the spiritual sterility of the aim. The Stoic or Epicurean philosopher seeks to be an isolationist God Incarnate; the Hinayanian arhat schools himself for the self-annihilation of the Buddha, not for the self-sacrifice of Christ. Such attempts at a withdrawal from the suffering and sorrow of This World without a return cannot bring salvation to Man because they are not truly godlike.⁴

This breakdown of a nobly austere Hellenic and Indic ideal of 'en-

⁴ See V. vi. 132-48, and pp. 391-2, above.

lightened self-interest' proclaimed the bankruptcy of its basely self-indulgent Modern Western caricature; and the writing on the wall of this Circaean 'City of Swine' was clear to read even before the outbreak of a Second World War.

'In A.D. 1933 the state of the World already afforded a crushing refutation of the creed of Humanism which had inspired the march of Western Civilisation for more than four hundred years and which had received its definitive formulation in nineteenth-century England in the apotheosis of "Enlightened Self-Interest".

"The enthronement of this nakedly pagan goddess is announced—to take one out of many examples at random—in the following sentence of a pamphlet which was published by the Society for the Promotion of Christian Knowledge, and which went into its twelfth edition in A.D. 1850:

"It is curious to observe how, through the wise and beneficent arrangement of Providence, men thus do their greatest service to the public when they are thinking of nothing but their own gain."¹

'While formally ascribing to Divine Providence the ultimate credit for this newly discovered beneficence of the Old Adam, the votaries of Enlightened Self-Interest were unavowedly replacing Christianity by a worship of unregenerate Human Nature. And the lie direct, which, in the name of Deism, is given in this passage to the teachings of the New Testament and to the doctrines of the Christian Church, seemed unanswerable in the particular time and place in which the pamphlet was written and disseminated. In mid-nineteenth-century England the uncompromising denunciations of economic acquisitiveness in the New Testament were reverentially but unhesitatingly explained away as Oriental hyperboles, and the ecclesiastical ban upon usury was openly laughed to scorn as a superstition, because the superiority of the children of This World over the children of Light, in practical wisdom, seemed conclusively demonstrated in the eyes of those in authority in that generation. On the other hand in the year 1933, which saw the failure of the World Economic Conference and the World Disarmament Conference, the nineteenth-century proposition seemed as ludicrous a paradox as the Christian view of life, and of human relations, had seemed in the Western World of A.D. 1850. In Victorian England, as in Periclean Athens and in Medicean Florence, Humanism had seemed sufficient unto itself, because Man was then experiencing the momentary sensation of being triumphantly master of his own fate through the power of his own *ἀρετή* or *virtù* or science, without needing the intervention of God either to chasten or to inspire him. By the year 1933 it was once more manifest that, "when they" were "thinking of nothing but their own gain", men were not only quite incapable of serving the public, but were even impotent to manage their own personal affairs to their own personal advantage. So far from being the great constructive driving-force in social life, the myopic pursuit of selfish personal interest was shown to be doomed, *a priori*, to miss its mark. Self-interest had proved, once more, to be a target of human aims on which direct hits could never be registered. This object of human desires could only be attained incidentally by people who stumbled across it on their road towards a transcendental goal of endeavour; and it followed that, if and when self-interest, private or social, was ever successfully

¹ *Easy Lessons on Money Matters for the Use of Young People*, 12th ed. (London 1850, S.P.C.K.), quoted by J. M. Keynes: *Essays in Persuasion* (London 1931, Macmillan), p. 85.

realised in this fortuitous way, it would turn out to be something with no recognisable likeness to the earthly paradise of *Homo Economicus*.

"Thus, as so often before, the so-called paradoxes of Christianity were proved to be truisms, while the children of This World were numbered once again among "the silly people who do not even know their own silly business". They were, in fact, most ludicrously convicted, in this chapter of history, of having sacrificed their own substantial interests to an academic dream. For the histories of the World Disarmament Conference and the World Economic Conference completed the proof that "Enlightened Self-Interest", so far from being an automatic, self-regulating psychological mechanism for making all things work together for Man's good, was nothing more than an intellectual abstraction which had no counterpart at all in the realm of practical life."¹

The association of the words 'enlightened' and 'self-interest' is, indeed, a *contradictio in adjecto* when 'enlightenment' is taken to mean a blindness to everything supernatural and superhuman in Man's vision of the Universe. In such a *Weltanschauung*, in which the Heavenly Light has been 'blacked out', 'enlightenment' does not lead even to the common-sense conclusion that the interest of the individual is inseparable from 'the greatest good of the greatest number'. Within the narrowing moral horizon of a godless universe, in which piety towards the dead has become inept, and providence for the unborn quixotic, a concern for the living generation of his fellow men also ceases to be within the individual's moral capacity. Thus, paradoxically, pure rationalism applied as a rule of conduct leads to the conclusion that the only 'realistic' course is to abandon Society to the irrational play of Chance; and this philosophy of prosaic despair begets a policy of monochronistic hedonism: 'Let us eat and drink; for to-morrow we die.'² *Brevis hic est fructus homullis*.³

Thus a society whose ever more complicated structure depends for its maintenance upon planning on the grand scale may lose the indispensable minimum of moral virtue at the moment when it has attained the requisite degree of intellectual capacity.⁴ It is, no doubt, emotionally abhorrent, as well as intellectually inept, to make irrevocable sacrifices in the hope of unguaranteed rewards; and, since, in terms of worldly results, every human endeavour may be proved by the event to be so much labour lost, Man would paralyse his powers of action altogether if he were ever to succeed in devaluing to zero the moral reward that is intrinsic in doing right, whatever the material consequences. Action is creation; and this godlike activity is possible for God's creatures only in so far as they surrender their wills to their Maker and thereby consecrate their action to the service of an actor whose plan is not subject to the miscarriages that so often overtake the best laid schemes of mice and men. The surrender of Man's will to God was the first and last commandment of a religion whose Founder had chosen this watchword

to be its name; and *islām* was offered for love's sake in the prayer of Saint Ignatius Loyola:

'Suscipe, Domine, universam meam libertatem; accipe memoriam, intellectum et voluntatem omnem. Quidquid habeo vel possideo, mihi largitus es; id tibi totum restituo, ac tuæ prorsus voluntati trado gubernandum. Amorem tui solum cum gratiâ tuâ mihi dones, et dives sum satis, nec aliud quidquam ultra posco.'¹

The evaporation of this prayer out of a desiccated heart had deprived a Modern Western *Homo Economicus* of the faculty which his Nazi Western adversary had aptly labelled *Aktionsfähigkeit*. The self-same 'enlightened self-interest' that had given him the technical skill to build a liner or a sky-scraper or a wireless station or an atom bomb plant had robbed him of the moral power to act on the unselfseeking motives, and to take the long views, which his marvellous technique required of him in order to allow it to bear fruit. An eighteenth-century English Whig landowner, who had put his treasure into the founding of a family, would plant avenues which even his grandchildren would not live to see with the eye of the flesh in the glory of the timber's full-grown stature. A twentieth-century Ministry of Agriculture planted soft wood to replace the hard wood that it felled; and, in this greediness for quick returns, it was advertising its disbelief in its own immortality, however loudly it might shout *Le Roi est mort! Vive le Roi!* The business men who had taken over from the landowners the management of a British Conservative Party had restricted the horizon of politics to the range of their own myopic commercial vision. *Après moi le déluge*, if business is booming today.

In June 1936, at a moment when the Western World was faced with a choice between checkmating Italy's aggression against Abyssinia and condemning itself to wage a Second World War, a British statesman-manufacturer who gave the *coup de grâce* to collective security betrayed an utter unawareness of the issue that was at stake. In Neville Chamberlain's eyes at that juncture, Great Britain's stand in support of the Covenant of the League of Nations was not a far-sighted attempt to avert a political catastrophe by upholding a moral principle; it was a perverse freak of pedantry which, by making bad blood between Great Britain and Italy, threatened to check the incipient recovery from the great depression that had afflicted the Western World in the opening years of that decade. This transitory return of economic prosperity was, for Chamberlain, the supreme reality that dominated his field of vision. 'The National Government . . . was able to point to a recovery which

¹ In *The Spiritual Exercises of Saint Ignatius*, edited by Rickaby, S. J., Joseph (London 1915, Burns & Oates), p. 209, the original Spanish text is given with the following English translation:

'Tomad, Señor, y recibid toda mi libertad, mi memoria, mi entendimiento, y toda mi voluntad, todo mi haber y mi poseer: vos me lo distes; á vos, Señor, io torno, todo es vuestro, disponed á toda vuestra voluntad. Dadme vuestro amor y gracia, que esta mi basta.'

'Take, O Lord, and receive all my liberty, my memory, my understanding, and all my will, all I have and possess: you have given it to me; to you, O Lord, I return it; all is yours; dispose of it entirely according to your will. Give me your love and grace, because that is enough for me.'

exceeded that of any great industrial nation in the World. . . . All around to-day were signs that the national prosperity was still mounting.' This was the leading note of an after-dinner speech, delivered by Chamberlain on the 10th June, 1936, in which he expressed the opinion that the continuance of economic sanctions against Italy on behalf of her victim, Abyssinia, was 'the very mid-summer of madness',¹ and of another address, delivered on the 27th of the same month, in which the same speaker asked whether a political opponent of his would 'suggest . . . that we should expose our people to the risk of those horrors which so shocked us when they were applied to Abyssinia?'²

The Youth, who daily farther from the East
Must travel, still is Nature's priest,
And by the vision splendid
Is on his way attended;
At length the Man perceives it die away,
And fade into the light of common day.³

And, 'where there is no vision, the people perish'.⁴ The epigoni of the paladins push their 'realism' to a point at which 'enlightened self-interest' spells an unheroic self-immolation—in the craven spirit of those Egyptian fallāh-conscripts who, with rifles grounded and bayonets unfixed, used to kneel in orderly ranks with their throats meekly uplifted for the Sudanese Mahdist warrior to cut at his ease.

These poor creatures allowed themselves to be massacred for lack of even that modicum of public spirit that was needful for saving their own skins;⁵ their Mahdist adversary conquered in virtue of a visionary willingness to die for his leader and his faith; and, when this Sudanese strong man armed was overcome physically by a stronger than he,⁶ his vision did not fail him. The 2nd September, 1898, which saw the annihilation of the hosts of the Khalifah of the Mahdi Muhammad Ahmad at Omdurman, 'was the last day of Mahdism, and the greatest'.⁷ The virtue of the barbarian who dies fighting for his tribe against hopeless odds—undismayed by the calculation that, on an 'enlightened self-interested' reckoning, he is sacrificing his life in vain—was exhibited on that day by the aged standard-bearer who charged a battalion armed with magazine rifles,⁸ and by the three survivors out of thirty thousand dead who stood facing three thousand victors, with their arms round the staff of their flag, till Death claimed them likewise.⁹ The same spirit was shown thirty-seven years later by the Amhāra when, in A.D. 1935, they ran to meet certain defeat and death at the hands of a Western aggressor

 τῶν αὐτῶν ὀδυνῶν γευσάμενοισι θανεῖν
 μοῖρ', ἀλλ' οὐ θάνατον τὸν Ἀρήϊον· οὐποτε τοῖον
 τοῖς ἐπιρκοῦσιν δῶρον ἔδωκε Θεός.¹

In a Modern Western social milieu in which the *reductio ad absurdum* of an 'enlightened self-interest' seemed to be extinguishing the vision without which Society cannot endure, the writer's generation had lived to see the example of a primitive barbaric virtue inspire a demonic Neo-Paganism. Fascism and Nazism had been formidable, in their brief hour, in so far as they had succeeded in winning the allegiance of good characters and in appealing to the better side of bad characters; and the touch of moral attractiveness, which was their strength, was due to their melodramatic repudiation of the *laissez-faire*, the utilitarianism and the *surtout pas de zèle* that had been the pedestrian principles of a commercial-minded age of Western history. This militant totalitarianism,² aping the tribalism of Primitive Man, had, of course, been only a pathological exaggeration of a parochial patriotism, caught by the West from a resurgent Hellenism³ at the dawn of the Modern Age of Western history,⁴ which, since this renaissance, had gradually come to be perhaps four-fifths of the effective religion of five-sixths of the people of the

¹ These Greek verses were first published in *The Times*, under a letter from the writer of this Study, on the 22nd April, 1936. The following translation, by G. M. Gatherer Hardy, appeared in *The Times*, under a letter from him, on the 25th of the same month:

Without our arms or art, these men could dare
 War's utmost frightfulness, since men they were,
 And, in close fight, to death untrembling passed,
 Still freemen, battling nobly to the last.
 But we, whose science makes us strong and great,
 Are doomed to share the tortures of their fate,
 Yet not their soldier's grave; the gods in scorn
 Withhold that privilege from men forsworn.

² See pp. 439-40, above.

³ See X. ix. 7-8.

⁴ This reversion, in a Modern Western World, to the principal cult of Hellenic paganism had generally carried with it, as its corollary, an avowed or tacit repudiation of Christianity. At certain times and places, however, this Western Neo-Paganism had had the hardihood to try to turn Christianity to its own account by treating it as if it were an ancestral pagan religion which it was convenient to preserve as an integral part of the social heritage of the secular community—as, in the Athenian city-state, the worship of Demeter and Dionysus and All Souls had been associated with the corporate self-worship of Athena Poliûchus as part-and-parcel of a totalitarian communal life in which there was no distinction between Church and State. This had perhaps been the prevalent attitude towards Christianity in Modern Italy during the century immediately preceding the Counter-Reformation; and, in the same spirit, the Modern French bourgeoisie had shown signs, in the nineteenth century, of reverting to a worldly-wise Catholicism from an 'enlightened' anti-clerical agnosticism. This latter-day movement in France was sketched in A.D. 1929 in the following terms, in a private letter to the writer of this Study, by an eminent French student of French life and politics:

'In my opinion, the renaissance of French Catholicism is closely bound up with the evolution of the French bourgeoisie itself. In 1848 the bourgeois took fright at the Revolution. Until then they had been, at bottom, Voltairians (though this did not

Western World.¹ The hold gained by this Neo-Hellenic corporate self-worship on a majority of ex-Christian hearts was due to its power of inspiring its votaries to give their lives on its behalf. Under the ashen deposit of 'enlightened self-interest' this fire lay hidden, yet unextinguished, in the hearts of Neville Chamberlain's countrymen; and Winston Churchill was able to blow it into sudden flame when the Fascist Powers scattered the ashes, to their own undoing, by assault and battery. When, in the summer of A.D. 1940, a Modern Western 'nation of shopkeepers' woke up to find itself with its back to the wall, it upset all Hitler's calculations, and thereby doomed him to ultimate defeat, by emulating the antique virtue of the Sudanese at Omdurman and the Abyssinians at Lake Ashangi.²

This unconsciously far-sighted folly that could move men to die for their country showed that the Modern Western cult of patriotism—whether in the Apollinean democratic or in the Dionysiac totalitarian vein—was in truth a religious revival in the spiritual vacuum left in human hearts by the evaporation of a higher religion. But the tragedy

prevent them from holding that "religion is wanted for the people"). Towards 1848 they began to say to themselves: "The *curé* is the best support of the *gendarme*." Thus they tended to become Catholics out of social apprehension; but these were Catholics without conviction. Their children, brought up in the Church, accepted the Catholic religion in another spirit towards the end of the century. The younger generation was suffering from the excessive individualism of the age; it sought in the Church a moral armour against anarchy. This Catholicism was of a higher kind, but it was not yet really religious; it was a political Catholicism to a large extent. On the eve of the War (that is, since about 1907) a new phase set in. The younger people, tired of pure intellectualism, found vent in action, in sport. They felt the approach of the War and prepared themselves for meeting it. Their Catholicism took the form of an affirmation of faith, of action, of devotion to their country.'

This movement was carried to extremes by the moving spirit of *L'Action Française*, Charles Maurras, who 'explicitly commended the Catholic Church on the ground that it had de-Christianized Christianity and had thus laid the foundations for a Neo-Paganism devoted to the cult of the sovereign national state'. This audacious attempt 'to press a church which was supra-national in the essence of its being into the service of a militant nationalism which claimed an ultimate and absolute value for itself' drew down upon Maurras' head, in January 1914, a condemnation of his journal, together with several books from his pen, by the Second Congregation of the Index at the Vatican; but, in confirming this decree, Pope Pius X forbore to make it public, in deference to representations from eminent French Catholics who had 'welcomed Monsieur Maurras' left-handed benediction of their faith on the calculation that the force of his personality and the charm of his literary style would propagate the faith in certain quarters in France, particularly among the younger generation, where it had little prospect of regaining a footing under any other auspices'. After a delay that was partly due to the dossier's having been temporarily mislaid in the Vatican archives, the decree of January 1914 was confirmed by Pope Pius XI on the 29th December, 1926, and was published early in 1927. (See Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1929 (London 1930, Milford), pp. 480-1, 483-4, 487-8).

This exploitation of a Catholic Christianity for pagan political purposes was, of course, only one of a number of diverse movements in the life of a nineteenth-century French Catholicism which was at the same time giving birth to great philosophers, great missionaries, and great saints (see IV. iv. 582).

¹ See p. 478, above.

² Churchill's decision in August 1940 to send powerful reinforcements from the British Isles to the British armies in the Middle East at a moment when the Battle of Britain was at its height in the air, when the victorious German armies were massed along the continental shores of the Channel, and when Great Britain was hourly expecting to be invaded on the ground by an enemy against whom she was momentarily defenceless, was an act of imaginative courage that is worthy to rank with the three great Roman deeds that have been compared with one another in this Study in a passage (III. iii. 269) written about six years before the outbreak of the General War of A.D. 1939-45.

of this Neo-Paganism was that its blinkered idealism only availed to replace its self-sacrificing votary's foot on the lowest rung of a ladder which had been scaled, to the summit, by the martyr, the bodhisattva, and the saint whose lead the neo-pagan's forefathers had once followed. A reinstituted worship of Leviathan is not the happy substitute that Frazer holds it to be¹ for the neglected worship of a One True God.

The only heart in which self-interest is truly 'enlightened', and therefore practically effective as a motive for action, is the heart of the saint who identifies his self-interest with the service of God and who therefore sees the field of action from God's angle of vision. He surveys the field from a height at which the authentic lineaments of the everlasting hills are not obscured by the mirage of uncertainty which pervades the landscape when it is regarded from the pedestrian human level. The saint is not paralysed by a horror of seeking unguaranteed rewards at the cost of irrevocable sacrifices, because he is convinced that the standpoint from which human action appears to be the unprofitable pursuit of a will-o'-the-wisp is one that gives a falsifyingly fragmentary vision of Reality. Such godlike enlightenment inspired the confidence and fortitude that Jesus and Socrates and More displayed when they forbore to embrace opportunities held out to them for saving their lives at the price of compromising the truth which it was their mission to proclaim.

'After this, as the duke of Norfolk and Sir Thomas More chanced to fall in familiar talk together, the duke said unto him: "By the mass, Master More, it is perilous striving with princes. And therefore I would wish you somewhat to incline to the King's pleasure; for by God's body, Master More, *Indignatio principis mors est.*"

"Is that all, my Lord?" quoth he. "Then in good faith is there no more difference between your Grace and me, but that I shall die today and you tomorrow." "²

'When Sir Thomas More had continued a good while in the Tower, my Lady, his wife, obtained license to see him; who, at her first coming, like a simple ignorant woman, and somewhat worldly too, with this manner of salutation bluntly saluted him:

"What the good year, Master More", quoth she, "I marvel that you, that have been always hitherto taken for so wise a man, will now so play the fool to lie here in this close filthy prison, and be content thus to be shut up amongst mice and rats, when you might be abroad at your liberty, and with the favour and goodwill both of the King and his Council, if you would but do as all the bishops and best learned of this realm have done. And, seeing you have at Chelsea a right fair house, your library, your books, your gallery, your garden, your orchard, and all other necessities so handsome about you, where you might in the company of me your wife, your children, and household, be merry, I muse what a God's name you mean here still thus fondly to tarry."

'After he had a while quietly heard her, with a cheerful countenance he said unto her: "I pray thee, good Mistress Alice, tell me one thing."

¹ See the passage quoted on pp. 383-4, above.

² Roper, William: *The Life of Sir Thomas More*, edited by E. V. Hitchcock (Early English Text Society, original series No. 197, London 1935, Oxford University Press), pp. 71-72, as quoted with modernized spelling in R. W. Chambers, *Thomas More* (London 1935, Cape), p. 300.

'“What is that?” quoth she.

'“Is not this house”, quoth he, “as nigh heaven as mine own?”

'To whom she, after her accustomed homely fashion, not liking such talk, answered, “Tilly vally, Tilly vally”.

'“How say you, Mistress Alice”, quoth he, “is it not so?”

'“Bone deus, Bone deus, man, will this gear never be left?” quoth she. . . . So her persuasions moved him but a little.¹

'The time has come', in the words ascribed to Socrates at the close of an address to his judges which was nominally a defence but was actually a refusal of a possible avoidance of the death-penalty, 'the time has come for us to go—I, Socrates, to my death, and you to carry on with your lives. Which of these two destinations is the better? That is a riddle which can be read by God alone.'²

τίς οἶδεν εἰ τὸ ζῆν μὲν ἐστὶ καθανεῖν
τὸ καθανεῖν δὲ ζῆν κάτω νομίζεται;³

No human being in this life can answer this question in terms that will guarantee to him, as his dividend, the maximum of worldly advantage; but a Socrates can answer it, in terms that will ensure his own condemnation to death, in the strength of his communion with a God from whose love 'nor height nor depth nor any other creature shall be able to separate us'.⁴

In the light of the truth that a goal can often best be reached by aiming, not at it, but at some more ambitious goal beyond it,⁵ we can now see the explanation of the paradox that, by striving single-mindedly to act as good citizens of the *Civitas Dei*, the saints succeed incidentally in saving the situation for social life in This World within the vastly larger framework of their own spiritual field of activity.⁶ Even a mundane law and order can be effectively established on Earth only on the model of a building that 'we have from God—a house not made with hands, eternal in the Heavens'.⁷

5. *The Promise of Exorcizing the Perilousness of Mimesis*

The Achilles' heel in the social anatomy of a civilization is, as we have seen,⁸ its dependence on mimesis as a 'social drill' for ensuring that the rank-and-file of Mankind shall follow their leaders. In the change over from a Yin-state into a Yang-activity which takes place at the genesis of a civilization through a mutation in the character of a primitive society, the rank-and-file transfer their mimesis from the ancestors⁹ to creative human personalities of the living generation;¹⁰ but the avenue

³ Euripides: *Polyeides*, fragment 2.

⁴ Rom. viii. 39.

⁵ See pp. 388 and 510, above.

⁶ On this point see III. iii. 267–9. The spiritual peril to which a terrestrial embodiment of the *Civitas Dei* exposes itself by such incidental mundane achievements is examined on pp. 545–8, below.

⁷ 2 Cor. v. 1.

⁸ In III. iii. 245–8 and IV. iv. 119–33.

⁹ 'The mass of Mankind plods on, with eyes fixed on the footsteps of the generations that went before, too indifferent or too fearful to raise their glances to judge for themselves whether the path on which they are travelling is the best, or to learn the conditions by which they are surrounded and affected' (Galton, Francis: *Hereditary Genius* (London 1869, Macmillan), p. 197).

¹⁰ See II. i. 192.

thereby opened for a social advance may end in a *ianua leti*,¹ since no human being can be creative except within limits, and even then no more than precariously, and, when an inevitable failure has bred an equally inevitable disillusionment, the discredited leader is apt to resort to force in order to retain an authority that is morally forfeit. In the *Civitas Dei* this peril is exorcized by a fresh transfer of mimesis—this time from the limitedly and precariously creative human personalities who are the ephemeral leaders of mundane civilizations to a God who is the source of all human creativity and whose own divine creativity is infinite.

This mimesis of God can never expose human souls that devote themselves to it to those disappointments and disillusionments that are apt to attend the mimesis of even the most godlike human beings, and that produce, when they do arise, that moral alienation of a restive proletariat from a now merely dominant minority which is one of the symptoms of social decline and fall. The communion between the Soul and the One True God cannot thus degenerate into the bondage of a slave to a despot, for in each of the higher religions, in diverse measure, the vision of God as Power is transfigured by a vision of Him as Love; and the presentation of this Loving God as a Dying God Incarnate is a theodicy which makes the imitation of Christ immune against the tragedy inherent in any mimesis that is directed towards unregenerate human personalities.

In the story of Christ's temptation in the wilderness at the beginning of His Ministry,² and of His Passion at the close of it,³ He is presented in the Gospels as refusing, at the price of the Cross, to exercise a spiritually sterile option of imposing His divine will by an act of power. Let a renegade Dionysus indulge an ungodlike lust for human glory by conquering all the Kingdoms of the World,⁴ and an unedifying animus against his pitifully unsuspecting human persecutor by dealing him, out of the blue, a blasting blow. A divinity who subjugates India and takes his revenge on Pentheus⁵ demonstrates his power of taming men's bodies at the cost of alienating their feelings, while a God who suffers death on the Cross draws all men unto Him.⁶

"The story of the Temptations is, of course, a parable of His spiritual wrestlings. . . . It represents the rejection, under three typical forms, of all existing conceptions of the Messianic task which was to inaugurate the Kingdom of God. Should He use the power with which, as Messiah, He is endowed to satisfy the creature wants of Himself and His human brethren, so fulfilling the hope of a "good time coming" which prophets had presented in the picture of the Messianic Banquet—(cf. e.g. *Isaiah* xxv, 6)? Should He be a Caesar-Christ, winning the kingdoms of the World and the glory of them by establishing an earthly monarchy and ruling from the throne of David in perfect righteousness—(cf. e.g. *Isaiah* ix, 6, 7)? Should He provide irresistible evidence of His divine mission, appearing in the Temple courts upborne by angels, so that doubt would

² Matt. iv. 1-11; Mark i. 12-13; Luke iv. 1-13.

³ Matt. xxvii. 53; John xviii. 36; xix. 11.

⁵ See V. vi. 265-6.

⁴ Matt. iv. 8; Luke iv. 5.

⁶ John xii. 32.

be impossible—(cf. e.g. *Daniel* vii, 13, 14 and *Enoch*)? Every one of these conceptions contained truth. When men are obedient to the Kingdom of God and His justice, everyone will have what he needs for food and clothing (*St. Matthew* vi, 33). The Kingdom of God is the realm of perfect justice where God's righteous will is done (*St. Matthew* vi, 10). The authority of Christ is absolute and can claim the support of the hosts of Heaven (*St. Matthew* xxviii, 18; xxvi, 53). Yet, if any or all of these are taken as fully representative of the Kingdom and its inauguration, they have one fatal defect. They all represent ways of securing the outward obedience of men apart from inward loyalty; they are ways of controlling conduct, but not ways of controlling hearts and wills . . . and the Kingdom of God, who is Love, cannot be established in that way.¹

In the imitation of Christ, this God who is Love draws the Soul towards Himself by evoking a love that is a response in kind to His; and because, in this communion of loves, there is no alloy of coercion, a travail in the Soul which begins as an exercise of mimesis bears fruit in a reception of grace, through which the Soul is enabled to partake of the inward spiritual qualities whose outward visible manifestations it has taken as its rule of life. Instead of ending in frustration, disillusionment, and strife, 'imitation' (μίμησις) here flowers into an 'assimilation' (ὁμοίωσις) of Man's nature to God's.² The 'light caught from a leaping flame', which was imparted to Plato's disciples 'by strenuous intellectual communion and intimate personal intercourse' with the Master,³ now reappears as the gift of the Holy Spirit at Pentecost;⁴ but, instead of being an esoteric initiation within the sanctum of an Academy which none but a properly qualified mathematician may enter,⁵ the pentecostal fire is a grace that God can give to any human soul that truly seeks it.⁶

B. THE ROLE OF CIVILIZATIONS IN THE LIVES OF CHURCHES

(I) CIVILIZATIONS AS OVERTURES

IF the foregoing inquiry has convinced us that the churches embodying the higher religions are diverse approximate projections on Earth of one and the same *Civitas Dei*, and that the species of society of which this Commonwealth of God is the sole and unique representative is of a spiritually higher order than the species represented by the civilizations, we shall be encouraged to go farther in our experiment¹ of inverting the assumption, on which we have tacitly proceeded in previous Parts of this Study, that, in the relation between churches and civilizations, the civilizations' role is dominant and the churches' role subordinate. Instead of dealing with churches in terms of civilizations, as hitherto, we shall boldly make the new departure of dealing with civilizations in terms of churches. If we are looking for a social cancer, we shall find it, not in a church which supplants a civilization, but in a civilization which supplants a church; and, if we have thought of a church as being a chrysalis through which one civilization reproduces itself in another, we shall now have to think, inversely, of the 'apparented' civilization in this genealogical series as being an overture to the epiphany of a church, and of the 'affiliated' civilization as being a regression from this higher level of spiritual attainment.

This finding answers a question which, in an earlier context,² we have been led to raise through noticing an apparent inconsistency in Plato's reading of one of the riddles of human destiny. Which, we have asked ourselves, are the true catastrophes: the breakdowns of civilizations or their births? Our answer now will be that the birth of a civilization is a catastrophe if it is a regression from a previously established church,³ while the breakdown of a civilization is not a catastrophe if it is the overture to a church's birth.

The second of these two interdependent conclusions is, as will be seen, an application to the life of a civilization as a whole, in all chapters of its history and on all planes of its activity, of a truth that has already impressed itself on us in our study⁴ of the political institution in which a disintegrating civilization is apt to embody itself in the penultimate rally before its final dissolution. We have seen that universal states succeed in being creative in so far as they serve beneficiaries other than themselves, and that the beneficiaries of universal states who have made the most fruitful use of their secular benefactors' services have been the churches. We can now see that, in discharging this creative mission of helping churches to come to birth, universal states are acting not simply on their own account but as representatives and agents of the

¹ See p. 420, above.

² In IV. iv. 585-8.

³ On this point see the passage quoted from Metternich's memoirs on p. 512, above.

⁴ In VI, *passim*, but especially in Parts A and B, on pp. 1-52, above.

civilizations embodied in them; and, while their official mandate—which is to avert, and not merely to postpone, the dissolution of a disintegrating society—may be an inherently impracticable task, they may find compensation for a perhaps inevitable failure here in the magnificent success of enabling a dying civilization to complete the fulfilment of its historical *raison d'être*.

If we take, as a test case for the verification of this thesis, the genesis of the Christian Church, and cite the tenuous yet significant evidence afforded by the transference of words from a secular to a religious meaning and usage, we shall find this philological testimony supporting the view that Christianity is a religious theme with a secular overture, and that this overture consisted, not merely in the Roman political achievement of an Hellenic universal state, but in Hellenism itself, in all its phases and aspects.

The Christian Church is indebted for its very name to the technical term employed, in the city-state of Athens, to denote the general assembly of the citizen-body when it was meeting to transact political, as distinct from judicial, business; but, in thus borrowing the word *ecclesia* (ἐκκλησία), the Church gave it a dual meaning which was no part of the original Attic usage but was the reflection of a new political order, in which Athens and all other surviving city-states of a disintegrating Hellenic World had been incorporated into the Roman Empire without losing their identities as units of local government and life on the municipal level. In Christian usage, *ecclesia* came to mean both a local Christian community¹ and the church universal.

When the Christian Church, local and universal, came to be articulated into the two ecclesiastical classes of 'laity' and 'clergy', and when the 'clergy', in turn, came to be graded into a hierarchy of 'orders' in an ascending scale of dignity and authority, culminating in the 'order' of 'bishops', the requisite terms of ecclesiastical administrative art were likewise borrowed from an existing secular Greek and Latin vocabulary.

The 'laity' of the Christian Church was suggestively designated by an archaic Greek word (λαός) which denoted the people as distinct from those in authority over them, with a connotation of amenability to the word of command. In the vocabulary of the Homeric Epic the word had been used of the naïvely loyal *comitatus* of a barbarian war-lord; in a post-Alexandrine Age of Hellenic history it had been revived to serve as a technical term for the naïvely submissive labour force on one of the large-scale agricultural estates which the Hellenic conquerors of the Achaemenian Empire had taken over from a dispossessed Persian landed aristocracy.² The ambivalency in the *nuance*, half-heroic and half-servile, which the word had thus come to acquire by the date of the beginning of the Christian Era, aptly fitted the 'laity' of a church which, on its own spiritual plane, was both militant and authoritarian.

By contrast, the 'clergy' took its name from a Greek word (κλήρος)

¹ When the 'outdoor' Hellenic Civilization gave place to the 'indoor' Orthodox and Western Christian civilizations, the word *ecclesia*, in its local meaning, came to be applied, not only to the local Christian community, but to the parochial building in which it assembled for congregational worship.

² For this Persian landed aristocracy, see pp. 123-4, above.

whose general meaning of 'lot' had been specialized in a juridical sense to mean an allotted share of an inherited estate, and in a political sense to mean an allotted share of a conquered territory. This political usage, which had been borrowed from Spartan conquerors in the Peloponnese¹ by Athenian conquerors in the Archipelago and Macedonian conquerors in Egypt and South-Western Asia, had given the word a rather unfortunate connotation by the time when the Christian Church began to work out its ecclesiastical organization. The Church adopted the word, nevertheless, to mean the portion of the Christian community that God had allotted to Himself to serve Him as His professional priesthood.²

As for the 'orders' (*ordines*) of clergy in the Christian ecclesiastical hierarchy, they took their name from the politically privileged classes in the Roman body politic, which were known as *ordines* both collectively and severally (*ordo senatorius*, *ordo equestris*), to distinguish them from the common run of Roman citizens.

The members of the highest order in the Christian hierarchy came to be known as 'overseers' (*ἐπισκόποι*), and the initial preposition, as well as the literal meaning, of this compound Greek word are likewise to be found in the title (*ἐφόροι*) which had been given in the Spartan body politic to the members of a board of supreme executive officers who were appointed by election but were constitutional despots during their term of office.³

The Christian Church's sacred book—taken over from the Jews and eventually augmented by the addition of an exclusively Christian 'New Testament' to supplement and retrospectively reinterpret 'the Old Testament' of Jewish origin—was presented by the Church as its credentials in the belief that this was the authentic Word of God Himself. In so far as the Bible was not referred to as 'the Books' (*τὰ βιβλία*) *par excellence*, it was designated by a term long since current in the vocabulary of the Roman inland revenue. In the fiscal terminology of a post-Hannibalic Roman Commonwealth the word *scriptura* signified the tax payable for the right to graze cattle on the public lands in the devastated areas in the South of Italy, because an entry in the official register, certifying that a would-be grazier had duly paid his tax, was the warrant that authorized him to make use of the public pasturelands. The Greek equivalent of the Latin *scriptura* was *γραφή*, and in a latter-day Kingdom of Greece at the time of writing there was a district in the Southern Pindus, between the plains of Thessaly and the west coast, which was still known as the Agrapha because the agents of an Ottoman inland revenue—and an East Roman inland revenue in an earlier age—

¹ See III. iii. 53, 57, and 68.

² "The following seems to be the sequence of meanings by which the word *κληρος* arrived at this peculiar sense: (i) the lot by which the office was assigned [as in Acts i. 26]; (ii) the office thus assigned by lot [as in Acts i. 17]; (iii) the body of persons holding the office' (Lightfoot, Bishop J. B., in his edition of Saint Paul's Epistle to the Philippians, 7th ed. (London 1882, Macmillan), p. 247). This usage cannot be traced back to the Old Testament; for, though, according to Num. xviii. 20, God is the *κληρονομία* of Aaron, and, according to Deut. xviii. 2, He is the *κληρος* of the Levites, 'the Jewish priesthood is never described conversely as the special "clerus" of Jehovah, while on the other hand the metaphor thus inverted is more than once applied to the whole Israelite people' (Lightfoot, *op. cit.*, p. 246).

³ See III. iii. 56.

had never succeeded even in inscribing in their registers, not to speak of actually collecting, the taxes due from the wild highlanders in this mountain fastness. As for the two 'testaments' of which the Christian scriptures consisted, they were called *διαθήκαι* in Greek and *testamenta* in Latin because they were thought of as being the equivalents of legal instruments in which God had declared to Mankind, in two instalments, His 'will and testament' for the ordering of Human Life on Earth.

The 'training' (*ἀσκησις*) to which a spiritually ambitious *élite* in the Early Christian Church subjected itself took its name from the physical training of athletes for the Olympian and other international athletic contests that were one of the characteristic expressions of the Hellenic culture; and, when, in the fourth century, training to be an anchorite (*ἀναχωρητής*) took the place of training to be a martyr in the psychological warfare of a Christian Church which had now made its peace with the Roman Imperial Government, the action of this new-model Christian athlete, whose ordeal was to endure the solitude of the desert instead of facing the publicity of the criminal court, came to be designated by a Greek term taken from the technical administrative vocabulary of the country that bred the pioneer Christian hermits. In Augustan Egypt 'anachôrêsis' (*ἀναχώρησις*) had meant withdrawal from productive economic activities in protest against the exactions of the taxation-authorities;¹ in Diocletianic Egypt the same word came to mean withdrawal from the World in protest against mundane human wickedness.²

When these solitaries (*μοναχοί*) had the courage to act on the lessons of their spiritual experience, in common-sense defiance of the literal meaning of their name, by subjecting themselves to the spiritual discipline of leading a common life together without surrendering the spiritual freedom won by withdrawal from the rest of the World, this creative contradiction in terms—a society of solitaries—took its Latin name from a word which, in its previous secular use, had combined the two meanings of a quarter sessions and a chamber of commerce.³

When the originally informal proceedings at the periodic meetings of each of the local Christian communities crystallized into a hard-and-fast ritual, this religious 'public service' (*λειτουργία*) took its name from the nominally voluntary *corvées* which, in a democratic Athenian Commonwealth in the fifth and fourth centuries B.C., had been euphemistically

¹ 'So early as A.D. 20 we hear of the flight (*anachôrêsis*) of tax-payers' (Bell, H. I.: *Egypt from Alexander the Great to the Arab Conquest* (Oxford 1948, Clarendon Press), p. 77).

² We have observed in an earlier context (on pp. 388-91, above) that this withdrawal of the anchorites was not anti-social either in intention or in effect. The anchorites influenced, aided, and, in great emergencies, sometimes actually governed a tottering Hellenic World with a moral authority which they would never have commanded if they had not proved the sincerity of their disinterestedness by insulating themselves physically from their fellow men.

³ The provinces into which the Roman Commonwealth had organized its subject territories had been mapped out into districts corresponding to the principal cities which each province contained; and it had been customary for the provincial governor to go on circuit round these 'county towns', to transact judicial and other public business. During his stay in each 'county town' he expected the leading Roman citizens, resident in that district, to hold a rendezvous with him there to serve as his assessors in court and to assist and advise him in other ways. This rendezvous was known as a *conventus*, and the name came thence to be applied both to the standing organization of Roman residents in each district and to the geographical area itself.

known by that name in order to glose over the truth that they were virtual surtaxes under the guise of 'benevolences'.

In the Christian liturgy the crucial rite was a Holy Communion in which the worshippers achieved a living experience of their fellowship in and with Christ by partaking together of the 'sacrament' (*sacramentum*) of eating bread and drinking wine. This Christian 'sacrament' took its name from a pagan Roman rite in which a new recruit was 'sworn in' to the fellowship of the Roman Army.¹ The Holy Communion which this common participation in the Christian sacrament consummated took its name from a word which, in the previous mundane usage of both its Greek original (*κοινωνία*) and its Latin translation (*communio*), had signified 'participation' of any kind, but, first and foremost, participation in the membership of a political community, for which the current term was coined, in both languages, out of the same verbal metal (in Greek *κοινόν*; in Latin *commune*).

One of the features of the Christian liturgy was a recurrence of its ritual in both annual and weekly cycles. The Christian liturgical week was modelled on a Jewish prototype; and, though the Christian copy had been differentiated from the Jewish original by making the first day of the week the holy day instead of the seventh, the Christian adaptation still followed the pristine Jewish dispensation in retaining the Jewish name for the eve of the Sabbath. In the Greek Christian vocabulary, Friday continued to be called 'the preparation' (*παρασκευή*)—in accordance with a Jewish usage in which this elliptical term explained itself. In the psychological atmosphere of a post-Exilic Judaism, in which a stateless diasporà maintained its *esprit de corps* by a common devotion to the keeping of the Mosaic Law, 'the preparation' *sans phrase* could mean nothing but 'the preparation for the Sabbath'. By analogy it is evident that the inevitable connotation of the word would be, not a liturgical, but a political one in the psychological atmosphere of a pre-Alexandrine Athenian sovereign city-state whose citizens worshipped their own then still potent corporate political power under the name of Athena Poliúchus. In the usage of Thucydides, writing for an Athenian public for whom politics were the breath of life, and whose political-mindedness was being accentuated in the historian's generation by the military ordeal of the Great Atheno-Peloponnesian War, the word *παρασκευή* could be used as elliptically as it was afterwards to be used in the Septuagint to convey, just as unmistakably, an entirely different meaning. Thucydides uses the word to signify what a generation of Englishmen, overtaken unawares by a world war in the year A.D. 1914, learnt ruefully to take to heart as 'preparedness' when they found themselves within an ace of defeat owing to their pre-war neglect to emulate the Germans in building up a stock of armaments to stand them in good stead in a fight for their national existence.

The customary preparation for the congregational performance of the Christian liturgy was, in a Western Christian town or village, the ringing

¹ In the Latin-speaking Church the word *sacramentum* was used from the beginning in the two meanings of sacrament and military oath, according to Harnack, A.: *Militia Christi* (Tübingen 1905, Mohr), pp. 33-34.

of a bell; and in a pagan Hellenic walled city this had likewise been a familiar sound with a well-established mental association. Yet a citizen of an Hellenic city-state—if his ghost could walk in some latter-day Western town on a Sunday morning—would never suspect that the sound that was filling the air was a summons to religious worship; for, to his mind, the ringing of a bell would conjure up the utterly different mental vision of a military patrol going its rounds along the city wall to inspect the sentries.

The change of usage from a secular to a religious meaning can be illustrated by other instances. The 'transgression' (*παράβασις*) which had been a term of art in the Attic 'Old Comedy', in the physical meaning of a parade of the chorus from one side of the theatre to the other, had come to mean, in Christian language, a figurative 'side-step' in the spiritual sense of a sin. Edification (*aedificatio*) had similarly come to mean the figurative 'building up' of virtue in the Soul in place of its original meaning of the construction of a material edifice in brick or stone. The Greek word *πνεῦμα*, with its Latin equivalent *spiritus*, had come to mean 'spirit' instead of 'breath', and the Greek word *σωτήρ* to mean a saviour, not of Society, but of the Soul.¹

The evocation of an inspiringly spiritual meaning out of a crassly material one is an example of a process which, in an earlier context,² we have learnt to know as 'etherialization'³ and to recognize as a symptom of growth. Our foregoing survey of the etherialization of the Greek and Latin vocabulary, in the course of its transference from pagan to Christian use,⁴ has been brief, casual, and nothing like exhaustive; yet,

¹ See V. vi. 175-278.

² In III. iii. 174-92.

³ A comic instance of etherialization-under-misapprehension was recounted to the writer of this Study in A.D. 1928 when he was on a visit to the city of Kovno, which was at that time the *de facto* capital of a sovereign independent Republic of Lithuania. Standing on the bank of the Niemen and gazing across the river's broad expanse, he noticed, on the farther shore, a three-story brick building, with a tower at one end, which looked as if it were new and which made a prominent mark in the landscape. 'Oh, that,' said his cicerone, 'is our brand-new national grain elevator. We are proud of its efficiency; but the peasants who come into the city to market from this side of the river venerate it for a droll reason which I will explain. As these peasants never have any occasion to cross the river, they have never seen that building from nearer than this, and from this distance it looks to them like a church, though as a matter of fact it has been built on the most up-to-date American pattern for a grain elevator, and, if its architecture does have an ecclesiastical air, the effect is quite undesigned. The peasants, though, would never think of that. In fact, it would never occur to them that such a large, handsome, and expensive building as this could be put up for any purpose except the glory of God; so, for the peasants, that imposing pile is now "the church of Saint Levatorius". How did they coin the name, you ask me? Well, you see, that name was pretty well inevitable. When the peasants asked what the building was, they were told, of course, "elevator"; and of course they took it for granted that this was the name of the supposed church's patron saint. So they added a Homeric termination (you realize, I hope, that Lithuanian is the best preserved of all the living Indo-European languages) and dropped the initial "e". That makes "Levatorius". And could any saint have a more convincingly appropriate name? Isn't it a saint's first business to give his protégés' souls a helping hand upwards on their way to Heaven—to serve, in fact, as a spiritual "elevator", if it isn't unpardonable blasphemy to describe traditional Christian aspirations in the telling terms of modern economic apparatus?'

⁴ The evidence of language, which testifies to the part played by Christianity in the etherialization of the Hellenic culture, also reveals that, in this work of semantic metabolism, Christianity had been anticipated by Greek philosophy. For example, the 'self-sufficiency' (*αὐτάρκεια*) which, in a pre-Alexandrine Age, had been the economic objective of sovereign city-states, whose governments approached economics from the standpoint of politics and war, thereafter became the moral ideal of a sovereign Stoic

even so, the handful of Greek and Latin words whose history we have been following range so wide and cut so deep in their interpretation of life as to indicate that Hellenism was an authentic *praeparatio evangelii*, and that, in looking for the *raison d'être* of Hellenism in its service as an overture to Christianity, we have at any rate set our feet on a promising line of inquiry. In this perspective it looks as if a civilization that brings a church to birth and perishes in the creative act does not stultify itself by perishing, but, on the contrary, justifies its existence by carrying out its historical mission at the cost of its own life. The egg-shell has to be broken for the chicken to be hatched, and the mould has to be broken in order to disengage the metal casting; but this sacrifice of the means for the accomplishment of the end is not the brand of failure; it is the seal of success. The egg-shell that remains unbroken is the shell of an addled egg which has miscarried in its purpose of bringing a new creature to life; the casting-mould that remains unbroken is the mould that has been scrapped either because its own pattern has proved faulty or because the injected molten metal has proved base. On the same showing, when the life of a civilization has served as the overture, not to the miscarriage of an abortive church,¹ but to the birth of a living church that has 'shot up and thriven'² and 'grown in wisdom and stature',³ the death of the precursor civilization is not a disaster but a triumph. What looks, on first view, like wasteful incompetence or

sage who towered, politically naked and therefore spiritually free, above the ruins of a city-state sovereignty that had collapsed under the blows of Macedonian war-lords (for this moral autarky of the post-Alexandrine school of Greek philosophy, see V. vi. 132-48 and 149-54). We may also remind ourselves that the word 'organ' (*ὄργανον*) had been adapted by Aristotle to mean a mental instead of a physical tool before, in Christian usage, it relapsed into meaning a physical instrument with the special function of making music in church.

¹ The number of abortive churches has, as we have seen, been large by comparison with the number of those that have been born alive and have grown unwarped. The rudimentary churches created by the internal proletariats of the civilizations of the first generation all failed to come to flower (see opposite Table IV, p. 772, below); and, among the four churches that were alive at the time of writing, those two—namely the Christian Church and the Mahāyāna—to which the Hellenic Civilization had served as an overture were survivors of not less than seven competitors—if we enumerate, as their unsuccessful rivals, the worships of Cybele and Isis, Mithraism and Manichaeism, and the popular religion which was a metamorphosis of the Neoplatonic philosophy. If any or all of these five failures had been successes, Hellenism would no doubt have served as an overture to them as effectively as it did in fact perform that service for Christianity and the Mahāyāna.

These five abortive churches had been defeated in a competition to be the chosen vessel for playing a church's authentic role. There had been other churches, as we have also seen, which, with this spiritual opportunity open to them, had committed spiritual suicide by going into politics. Cases in point were the syncretistic Egyptian Church which had owed its foundation, in the reign of Thothmes III, to a Pharaonic act of state, and whose *ex officio* pontiff Hrihor, the Chief Priest of Amon-Re of Thebes, had tried to step into Pharaoh's shoes when the New Kingdom had sunk to its nadir; Zoroastrianism, Judaism, Nestorianism, and Monophysitism, which had allowed themselves to be used by a submerged Syriac Civilization as weapons in its warfare against a dominant Hellenism; and Imāmi Shi'ism and Sikhism, which had invested their spiritual treasure in the perverse political enterprise of founding a mundane empire. Islam alone had partially succeeded in retrieving a false step into which it had been led in its infancy by its Founder. When a church thus sells its birthright for a mess of pottage it can no doubt sterilize a precursor civilization's creative work, and thereby posthumously render that civilization's death of no avail; but, in such an event, the true failure is, not the precursor civilization's dissolution, but the beneficiary church's repudiation of a heritage that has been bequeathed to it at so great a price.

² Herodotus, Book I, chap. 66.

³ Luke ii. 52.

wanton sabotage turns out to have been a *chef-d'œuvre* of the craftsman's art.

In the shipyard, idly talking,
At the ship the workmen stared:
Someone, all their labour balking,
Down her sides had cut deep gashes:
Not a plank was spared.¹

King Olaf, who has come to feast his eyes on the new craft to which his master-builder, Thorberg Skafting, was to have put the finishing touches, is enraged at the havoc and dumbfounded to hear, from the lips of the master himself, that the hand which has laboured all night to do this thing is Thorberg's own. But this at first sight insensate act takes on the very opposite complexion when, before the King's eyes, the craftsman finishes and vindicates his work by chipping and smoothing the cruelly-gashed planking into lines of a fineness that no shipwright has ever before achieved.

Our test case of the relation between the Hellenic Civilization and Christianity has been summed up, with an admirably judicial precision, by an American scholar writing between the two World Wars:

'Because the greatness of Christianity was not temporal but spiritual, its triumph boded ill for the State. Its final victory was only gained in the later fourth century; in the early fifth the western half of the Empire collapsed, and it is undeniable that the victory contributed to that fall. To the Christians the Empire lived in sin and must die before it could be re-born. It is true that many of them mourned the fall and hoped, and even prayed, that it might be averted; on the other hand few troubled to raise a temporal hand to forestall it. Already the cloud of predestination was darkening the bright new teleological sky: the natural wish to save the State into which they have been born must, like other temporal inclinations—to friendship, self-respect and prosperity—be repressed; for God was apparently ordaining otherwise, and men could only submit humbly to His will. On the other hand it is equally impossible to maintain that Christianity was a symptom of decadence. Ambrose, Augustine, and Bossuet were here more nearly right than Gibbon.² For these three said that Rome had come into being in order that out of it Christianity might spring; and this, because it respects the law of cause and effect, is an evolutionary conception at bottom. . . . Ambrose and Augustine had each, in his own way, outgrown Ancient Civilisation as he found it; each had learnt that Man was in fact something more than Antiquity had supposed.'³

(II) CIVILIZATIONS AS REGRESSIONS

We have been trying to see how History looks if we break with our Modern Western habit of viewing the histories of churches in terms of the histories of civilizations and adopt, instead, the inverse standpoint; and this essay in a reorientation of our historical outlook has led us, in the preceding chapter, to think of the civilizations of the second genera-

¹ Longfellow: *The Saga of King Olaf*, xiii: 'The Building of the Long Serpent.'

² See IV. iv. 58-63, and pp. 696-8, below.—A.J.T.

³ Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), pp. 133-4.

tion as overtures to the living higher religions, and consequently to regard those civilizations, not as failures branded as such by their breakdown and eventual disintegration, but as successes in virtue of their service in helping these higher religions to come to birth—a service which they were able to perform in the strength of their suffering, and which they might never have had an opportunity of performing if they had not fallen into adversity. On this analogy the civilizations of the third generation are presumably to be thought of as regressions from the higher religions that had arisen out of the preceding civilizations' ruins; for, if the mundane miscarriage of those now defunct civilizations ought to be judged to have been redeemed by its auspicious spiritual sequel, then the mundane achievement of the living civilizations in breaking out of their ecclesiastical chrysalises and setting out to live a new secular life of their own ought likewise to be judged on the criterion of its effect on the life of the Soul; and this effect had manifestly been an adverse one.

If we take, as a test case for the verification of this thesis, the eruption of a Modern Western secular civilization out of a Medieval Western *Respublica Christiana*, we may find it illuminating to begin, on the lines of our inquiry in the preceding chapter, by citing the evidence of words, sounds, and acts that had undergone a change of meaning and usage. The change that we were studying in our review of civilizations as overtures to churches was a change from a secular significance to a religious. In a review of civilizations as regressions from churches, the tell-tale change would be a change from a religious significance to a secular one. In taking note of such changes in the particular case of the transition to a secular Modern Western Civilization from a Medieval Western Christian Commonwealth, it will be convenient as far as possible to survey the fortunes of the same words, sounds, and acts in the order that we have followed in tracing the antecedent transition to Christianity from a pagan Hellenism.

In a secularized Modern Western World the 'cleric', whose designation once proclaimed him to belong to that portion of the Christian community that God had allotted to His own special service, had had to surrender his title to the 'clerk' who in England performed the minor office work in a government department or private business concern, and in America served behind the counter in a store.

The Christian Holy Communion, in which the communicants experienced their fellowship in and with Christ, had been implicated in a struggle for equality of rights which, in itself, had been a legitimate quest for justice, but which, at each successive stage in a history that had now run through many chapters, had been waged in ever grosser terms for an ever more material stake. In Bohemia in the fourteenth century of the Christian Era the battle for equality had been opened on sacramental ground; the issue had been between the laity and the clergy; and the stake had been communion in both kinds, which the Utraquists had demanded for the laity as against a clergy which had come to reserve the cup as a privilege for clerks in holy orders. In Holland and England in the Early Modern Age of Western History, and in the Western World

as a whole after the outbreak of the French Revolution, the battle for equality, which by then had long ceased to be fought at the altar rails, had found a new field in a political arena, where the bourgeoisie now demanded a share in the political power that had been exercised under the *ancien régime* by oligarchies, aristocracies, and monarchies. In the twentieth century the industrial working class of a Western Society that had now become literally world-wide was demanding equality in the distribution of economic wealth of which the lion's share had been appropriated by the middle-class authors of an eighteenth-century and nineteenth-century industrial revolution. In this twentieth-century class-war, which was being fought for an economic stake, the militant movement on the anti-bourgeois side had adopted the name 'Communism' to signify that it was fighting for a 'commune' in which there should be a community of worldly goods. Communion in this kind, not communion in the body and blood of Christ, was the connotation that this Latin word had come to have in secular twentieth-century Western minds. The twentieth-century Communists had travelled far indeed from the battle-ground of their fourteenth-century Utraquist forerunners. And, though, in their obsession with a legitimate struggle for economic justice, they had raised the emotional temperature of a political 'ideology' to a religious heat, the authentic leaf that they had torn out of the book of Christianity¹ was as unedifying out of its context as it was salutary in itself.

The change of values registered in this change in the meaning of a talismanic word was a consequence of perversity among the clergy as well as the laity of Medieval Western Christendom. The vanity of a lust for power, that had betrayed the priesthood into turning the eucharist into an esoteric incantation in a liturgical language which had long since ceased to be the living mother tongue of any of their congregations, was exposed in the meaning that had been given to the unintelligible Latin operative words in the Mass in the vocabulary of an alienated English-speaking Christian people. An epoch-making chapter of psychological as well as linguistic history was summed up in the contemptuously blasphemous distortion of *Hoc est Corpus* into 'hocus-pocus'.

This desecration of the Christian sacrament was advertised in a change in the meaning, not only of gabbled ritual words, but of rhythmic instrumental music. The ringing of a bell, which, in Christian ears, had traditionally been associated with a church bell calling the congregation to worship or announcing to them that the operative act in the Sacrament of the Mass had just been consummated by the officiating priest, had come in a twentieth-century North America to be associated with the matter-of-fact business of everyday life. A tolling bell there now signified the approach of a locomotive that was warning the public to beware, not of losing their souls, but of getting themselves run over; a buzzing bell was associated with the mental alertness of an efficient bell-boy in an hotel, who would present himself expeditiously at the door of Room No. 666 as soon as the momentary occupant had pressed the button that set the right bell ringing in the bell-captain's lair.

¹ See V. v. 581-7, and p. 445, above.

The Greek word (πνευματικός) that had been consecrated by Christianity to signify 'spiritual' had been 'released', in the Modern Western vulgar tongues, from its traditional service of conveying 'the wind' that 'bloweth where it listeth',¹ to provide the missing name for the ingenious new Western invention of imprisoning compressed air within 'pneumatic' rubber tires.

The Latin word 'conversion' had likewise been converted from an otiose religious to a practical secular use. This ancient word still 'rang a bell' in Modern Western minds, but in these latter-day mental bell-rooms its associations were no longer with the conversion of souls; in Western Man's swept and garnished house the word would suggest to an industrialist the conversion of coal or falling water into 'power'; to a financier it would suggest the conversion of the rate of interest on a loan to a lower rate than that originally guaranteed to a confiding investor; while to a police detective it would suggest the misappropriation of funds by a financier who had gone beyond the limits of the considerable discretion that the Law allowed him. In this last-mentioned usage, 'conversion' conveyed its meaning to modern Western minds *sans phrase qualifiante*—a nice point of language which distinctly indicated that funds were the commodity in which Modern Western Man had re-invested the treasure that his Christian forebears had once placed in souls.

In the Christian dispensation, 'conversion' had opened the door for 'salvation', but in a Modern Western secular usage this Latin word, too, had been 'released', like its old companion, from its traditional association with souls to serve more practical purposes. 'Salvage' had come to mean the rescue, not of an erring sinner, but of a foundering ship, and what was 'salved' in a twentieth-century Western World was, not a soul by the spiritual ministrations of a priest whose 'cure' was of that kind, but a body by the physical application of an ointment purchased in a shop, while what was 'saved' was, not the soul that had found its way to Heaven, but the money that had been deposited in the bank.

'Salvator'—the substantive coined by the Latin Christian Father Tertullian, at the turn of the second and third centuries of the Christian Era, to represent the Greek word σωτήρ in its application to Christ²—had so far escaped the desecration suffered by the verb from the same Latin root; for, even in ex-Christian Western minds, the predominant association of the word 'Saviour' was still with 'Our Lord'. But in its older Latin rendering, which had been 'conservator', the key word of Christianity had not been spared by sacrilegious hands. In being applied to the 'conservator' of some national museum or public park, or a member of 'The Thames Conservancy Board', the word had been 'converted' to a respectably illicit use; and the American usage of the adjective in the phrases 'a conservative estimate' and 'a conservative figure' could also perhaps pass muster—however great the gulf might be between the caution that was the virtue of a reputable business man and the love that had moved God to become Man in order to become Man's Saviour. It would be difficult, however, to whitewash the political application of the

¹ John iii. 8.

² See V. vi. 374, n. 3.

term which was its most familiar usage in a twentieth-century Western World; for in this context a 'conservative' meant the supporter of a political party whose *raison d'être* was the defence of material vested interests.

As twentieth-century Western students of History watched 'holy day' contracting into 'holiday', and 'the Christmas holidays' bringing with them a commercially profitable boom in retail trade instead of a spiritually regenerating reminder of Man's salvation through God's incarnation, they would realize that they were being carried away by a process of 'dis-etherialization' which was the inverse of what had happened when pagan Hellenic words had been converted to Christian uses; and the same tale was told by the lapse of the word 'news' from meaning 'the good news' (*εὐαγγέλιον*) of the Gospel to meaning the uninspiring output of a commercial newspaper press. In New Mexico the 'know-how' which there had once signified the innocent craft of Zuñi priests¹ had come to signify a lethal technology of atomic warfare that had been worked out at Los Alamos. But words and bell-peals were not the only evidence for the 'conversion' of spiritual treasures into worldly goods by an egocentric Western human nature. This misappropriation was also attested by positive and historic political acts.

'Frederick II had been the ward and pupil of the great Innocent, founder of the Church as a state. He was an intellectual man, and we need not wonder to find in his conception of Empire a reflection of the Church. The whole Italian-Sicilian State which the Popes coveted as their Patrimony of Peter became, as it were, the Patrimony of Augustus for this gifted monarch, who sought to release the secular and intellectual powers that were fused into the spiritual unity of the Church² and to build a new empire based on these.'³

In an earlier part of this Study⁴ we have briefly followed the course of an internecine struggle—waged without compromise between the belligerents and without mercy for a Medieval Western Christian body social that their strife was rending asunder—which a victorious Papacy pushed to the point of 'unconditional surrender'. But this was one of those Pyrrhic victories in which the victor appears, in retrospect, to have been a *felo de se*,⁵ while his victim proves to have been inextirpably hydra-headed.

'Let us grasp the full significance of Frederick's Italian-Roman State: a mighty pan-Italian seignory, which for a short time united in one state Germanic, Roman and Oriental elements—Frederick himself, Emperor of the World, being the Grand Signor or Grand Tyrant thereof, the first and last of these princes to wear the diadem of Rome, whose Caesarhood was not only allied with German kingship like Barbarossa's but with Oriental-Sicilian despotism. Having grasped this, we perceive that all the tyrants of the Renaissance, the Scala and Montefeltre, the Visconti, Borgia,

⁵ IV. iv. 567-71.

and Medici, are down to the tiniest features the sons and successors of Frederick II, the diadochi of this "Second Alexander".¹

Nor was this the end of the monstrous proliferation of hydra heads from Frederick's mortal coils; for the North Italian city-state despotisms² that were multiple replicas of Frederick's abortive oecumenical Caesaro-papacy reproduced themselves, in their turn, on the nation-state scale, in the Transalpine and Transmarine outer circle of an Italianized Western World at the opening of the so-called Modern Age of Western history;³ and these epigoni of the diadochi of Frederick the frustrated despoiler of Pope Innocent III were the successful despoilers of Innocent's successors⁴ when a golden opportunity was offered to them by the folly of a Martin V and a Eugenius IV in crowning Innocent IV's pyrrhic victory over Frederick's natural heirs⁵ with a not less pyrrhic victory over the Conciliar Movement.⁶ A scrutiny of the fundamental political and economic institutions of a secular Modern Western Society reveals that these were plunder from the Papal constitution of a Medieval Christian Commonwealth⁷—like the desecrated altars and dislocated drums of columns that had been built into acropolis-walls at Athens and at Ankara, or like the marble shafts, robbed from ruined temples, that supported the roofs of post-Hellenic basilicas and mosques. With silent eloquence these spoils proclaimed the Christian origin of a Western Civilization that had forfeited its title to its Christian name.⁸

If, in this sense, the secular civilization of the Modern Western World was an emanation of the spirit of Frederick II Hohenstaufen, what had been the source of the demonic power in virtue of which a would-be empire-builder who had been frustrated in his own lifetime had succeeded in producing this amazing posthumous effect? The riddle receives its answer when we remind ourselves of the reason why the Emperor Frederick II came so much nearer than his grandfather Frederick I to achieving their dynasty's arch-ambition. The abiding aim of the Hohenstaufen line was, within Ottonian bounds, to make a belated reality of an abortive Carolingian attempt to revive the Roman Empire in Western Christendom as it had been revived in Orthodox Christendom, two generations before Charlemagne's day, by the genius of Leo Syrus. What was it that nerved Frederick I Hohenstaufen to ignore the twin portents of Charlemagne's and Otto I's successive fiascos? What motive impelled him to make a third essay in an enterprise in which his two greatest predecessors had so signally failed? And what was it that gave his grandson the hardihood to renew the struggle in which his

⁴ See IV. iv. 576-8.

⁵ See ibid. 566-8.

⁶ See ibid. 571-6.

⁷ See ibid. 539-43. Mr. Martin Wight comments: "The most striking instance of this that I have come across is that the Papacy 'invented', not only diplomacy and international finance, but also the National Debt.

"The system of exchanges adopted in the Middle Ages originated chiefly in the nature of the papal revenues, which, due from all parts of the World, were to be transmitted to the Curia from every separate country; but it is equally worthy of remark that the system of national debt by which we are even now enveloped, and which maintains so important an influence on the operations of commerce, was first fully developed in the States of the Church" (Ranke, *History of the Papacy*, Bk. iv, § 2, *ad init.*).¹

⁸ See I. i. 32-34.

grandfather, in his turn, had been worsted? The grandfather had been inspired by the Caesaro-papal 'absolute' conception of the Imperial prerogative¹ that had been enshrined in the Justinianean *Corpus Iuris*² of a latter-day Constantinopolitan Roman Empire; for, in the Western Christendom of Frederick I's day, this treasure, which had recently been disinterred at Bologna,³ had still been an exciting new discovery.⁴ The grandson was inspired by the more vivid and convincing experience of inheriting the throne of the Sicilian 'successor-state' of an East Roman Empire⁵ in which Leo Syrus and his successors had succeeded⁶ in reasserting the Constantinian Roman Imperial ideal of 'Caesaro-papism' in the 'real life' of public administration, and not just in the lecture rooms of academic professors of a rediscovered Justinianean *Summa*.

It will be seen that the monstrous birth of a Modern Western secular civilization from the womb of a Medieval Western *Respublica Christiana*, which had been made possible by the mistakes and sins of the Medieval Western Church, was made practicable by the renaissance of the Hellenic institution of an 'absolute' state in which Religion had been a department of Politics. It will also be seen that, in Western Christendom, this renaissance of Hellenic political 'absolutism' was not achieved without external aid. Charlemagne's native Western attempt to revive the Roman Empire had been a fortunate failure; Frederick II Hohenstaufen's audacious repetition of Charlemagne's enterprise was a sinister posthumous success because the *Stupor Mundi Occidentalis* was able, in his Sicilian hereditary dominions, to draw upon the credit of East Roman statesmen who had duly performed the feat—an enterprise beyond Charlemagne's powers—of resuscitating the Constantinian Roman Imperial régime.

When a civilization of the third generation breaks its way out of a body ecclesiastic, is a renaissance of the 'apparented' civilization of the second generation the invariable and indispensable means by which this unhappy delivery is accomplished? If we look at the history of the Hindu Civilization, we shall find there no parallel to the resuscitation of an

¹ See IV. iv. 347-50.

² See pp. 265-8, above.

³ After the irruption of the Lombards into Italy in A.D. 568, Bologna had been the north-westernmost outpost of a Constantinopolitan Roman Empire *in extremis* for the best part of two centuries before its incorporation into the body social of Western Christendom through the conquest of the Exarchate of Ravenna by the Lombards in the course of the quarter of a century ending in A.D. 751.

⁴ See IV. iv. 557. The renaissance of a Justinianean Roman law in a Medieval Western Christendom is examined further in X. ix. 30-31.

⁵ Frederick's 'Oriental-Sicilian despotism', as Kantorowicz calls it, was, of course, a 'successor-state', not only of the East Roman Empire, but of the Arab Caliphate as well, since the greater part of the East Roman dominions west of the Straits of Otranto which Frederick's Norman predecessors had conquered in the eleventh century of the Christian Era had previously been reconquered by the East Romans from North-West African Arab *conquistadores* who, in the ninth and tenth centuries, had overrun a Lombard Apulia and an East Roman Sicily (see IV. iv. 343-4, 356-7, and 401-2). In Sicily the descendants of the Arab conquerors had not been dislodged by a Norman military conquest that had deprived them of their political ascendancy in the island; and they exercised a potent cultural influence over their new Western Christian barbarian masters. In its political aspect, this Arab influence was in harmony with the Byzantine, since the imperial tradition of the Caliphate, like that of the East Roman Empire, had descended through a Constantinian, Diocletianic, and Sasanian channel from an Achaemenian fountain-head.

⁶ See IV. iv. 346-7, 352, and 592-693.

'absolute' Hellenic polity which was achieved first in Orthodox Christendom by native political genius, and then in Western Christendom on the strength of a Byzantine *fait accompli*. Hindu history records no corresponding revival of the Empire of the Mauryas or the Empire of the Guptas. When we turn, however, from India to China, and look at the history of the Far Eastern Civilization in its homeland, we do here find an unmistakable and striking counterpart of the Byzantine revival of the Roman Empire in the Sui and T'ang revival of the Empire of the Han.¹

This Far Eastern renaissance of the universal state of an antecedent civilization is, indeed, the classic case; for by comparison even with the East Roman Empire, not to speak of 'the Holy Roman Empire', the Sui and T'ang Empire stands out as a solid success; and this success was due, as we have seen,² to a command of the administrative means required for achieving the political objective. Not only the political tradition but the administrative personnel of the Han Empire had survived the interregnum between the dissolution of the Sinic Civilization and the emergence of its Far Eastern successor. It had found asylum in the great cultural citadel which a disintegrating Sinic Civilization had provided for itself by expanding southwards up to the southern watershed of the Yangtse Basin and over it to the seaboard. The Confucian civil servants who reappeared in strength towards the close of the sixth century of the Christian Era, to administer a politically reunited South and North of China as a resuscitated Sinic universal state, surpassed their eighth-century Byzantine equivalents in cultivation and efficiency, as well as in numbers, in the measure in which the sub-continental citadel of Sinism between the Hwangho-Yangtsekiang watershed and the south coast of China surpassed in extent the ring-wall of the city of Constantinople, which was Hellenism's narrow-verged citadel during the interregnum between the dissolution of the Hellenic Civilization and the emergence of an Orthodox Christendom. As for Charlemagne's abortive 'Holy Roman Empire', the administrative reason for its failure³ was that, in the West in Charlemagne's day, there was not even an exiguous remnant of the former Roman civil service for a would-be empire-builder to enlist.

In the light of this disparity in the amount and in the value of the initial assets in these three different undertakings, it is not surprising that the renaissance of the Sinic Civilization in the Far Eastern World should have gone farther than the renaissance of Hellenism in either a Western or an Orthodox Christendom. For the purposes of our present inquiry it is significant that the civilization of the third generation in whose history the renaissance of its predecessor of the second generation had been carried to the greatest lengths should likewise have been the most successful in its generation in shaking itself free from the trammels of the church which its predecessor had brought to birth.

¹ See pp. 19-21, above.

² On pp. 370-2, above. See further X. ix. 20 and 665-7.

³ There was, of course, an economic reason as well (see II. ii. 345; IV. iv. 322-3 and 490).

The Mahayanian Buddhism that had bidden fair to captivate a moribund Sinic World as thoroughly as a moribund Hellenic World had been captivated by Christianity had reached its zenith in the Far East at the nadir of the post-Sinic interregnum;¹ but it had swiftly declined thereafter to a level of nonentity to which Christianity had never yet sunk either in Orthodox Christendom or in the West.

On this showing, we must conclude that the 'renaissance' of a dead civilization spells a 'regression' from a living higher religion, and that, the farther the revival is pushed, the greater the backsliding will be; but we may still be challenged to show why, even if this inverse variation were to prove to be a 'law' of History, it should be deplored as a catastrophe rather than be applauded as a triumph. Our judgement must indeed seem paradoxical to a Far Eastern Confucian civil servant or to a Western rationalist technician who believed in his heart that 'Man makes Himself'² and that, in Man's competent conduct of Mankind's proper business,³ the episode of the rise and fall of the higher religions had been a disturbing and discreditable interlude.

The reply to this challenge is *Respice finem*; for renaissances, as we shall see when we study them more closely,⁴ are apt to unfold themselves progressively by resuscitating elements of the life of the 'apparented' civilization in a chronological order that is the inverse of their historical sequence in their original appearance. A process of resuscitation which starts with the revival of a universal state that had been the last achievement of the antecedent society's dominant minority goes on to resuscitate the philosophy in which an imperial civil service had been schooled, and thence to resuscitate the styles of politics, architecture, sculpture, and literature that, in the history of the 'apparented' civilization, had been in vogue in earlier ages, until the pageant of a dead civilization's history has been dramatically re-deployed in reverse order on a living civilization's stage. This evocatory exercise of the imagination is manifestly bound to expose those souls that indulge in it to a risk of derangement through being distracted by a pursuit of incompatible ideals.

In Far Eastern history the tension produced by this inner psychic discord had from time to time sought relief in the outward form of a persecution of adherents of the Mahāyāna—or, at any rate, of followers of the Buddhist monastic way of life—by the secular public authorities at the instigation of the champions of Confucianism. The most extensive and persistent of these persecutions had occurred, as might be expected, during the second and less prosperous chapter of the T'ang Dynasty's three-centuries-long tenure of power—at a time when the Confucian scholar-administrators were beginning to feel less secure in the saddle and therefore less inclined to go on tolerating the persistence in their midst of a parvenu alien religious life which was a standing

⁴ In Part X, *passim*, in vol. ix.

challenge to the restored Confucian régime. These major persecutions had been inflicted in A.D. 845 and subsequent years.¹ But, even before the evocation of a ghost of the Sinic universal state by the Sui Dynasty in A.D. 589, there had been a persecution of the kind in A.D. 446² in a To Pa Eurasian barbarian 'successor-state' of the defunct Han Empire in Shansi which had sought to disguise its vulgar origin under the archaizing name of 'Wei'. At first sight it is surprising to find the Mahāyāna exciting the hostility of an ex-barbarian Power which had won its certificate of cultural respectability, and thereby made its political fortune, through its own conversion to the Mahāyāna in the preceding chapter of its history.³ On a closer view we can see that the revulsion against the Mahāyāna which declared itself in 'Wei' in A.D. 446 in an act of political coercion was the reverse side of a renaissance of the pre-Buddhist pagan Sinic culture which, in the 'Wei' Principality, reached its climax in the last decade of the fifth century of the Christian Era in the pedantically thoroughgoing Sinomania of the 'Wei' prince Hiao Wên-ti.⁴

In the Western World, in contrast to the course of the corresponding renaissance in Orthodox Christendom and in the Far East alike, the universal state of the antecedent civilization had never been successfully resuscitated; the failure had been most signal when Frederick II Hohenstaufen had drawn upon Leo Syrus's Byzantine achievement in a last attempt at retrieving Charlemagne's Austrasian failure; and, in consequence, the political renaissance here had cut its way back behind the oecumenical last act of Hellenic political history till, in the hands of Frederick II's fourteenth-century Italian diadochi and sixteenth-century Transalpine epigoni, it had arrived at a resuscitation of the parochial patriotism which had been both the strength and the weakness of the Hellenic Civilization at the culmination of its growth and on the eve of its breakdown. 'There is high tension and hard encounter between the Christian Faith and any form of civilization';⁵ and Modern Western Man's attempt to combine an ancestral Christianity with a resuscitated Hellenic idolization of a parochial political community had set up a tension in Western souls which had become all but intolerably high by the middle of the twentieth century.

'Europe's infatuation for the Greeks and Romans dates from the sixteenth century, when she began her great political and military reorganisation. She admired them in all things—even those arts in which the Middle Ages had excelled them—because they taught her how to organise armies, how to wage wars, and how to build up great states.'⁶

From the sixteenth century onwards the West had been seeking all the time to realize simultaneously a pagan Hellenic ideal of political

⁶ Ferrero, G.: *Peace and War*, English translation (London 1933, Macmillan): 'Paganism and Christianity', p. 194.

absolutism which, in the course of Hellenic history, had eventually choked the seeds of an Hellenic ideal of individual liberty, and a Christian ideal of individual liberty which was a corollary of a Christian belief in the value of every human soul in the sight of God;¹ and each of these two incompatible movements had been carried to a climax in the French Revolution.²

'We live in a state of permanent disharmony. The family, social life, manners and morals bear the stamp of Christianity; politics and war draw their inspiration from the classic and pagan tradition; law, literature, philosophy, art, and history are subjected to the competing influence of both. . . . What is the State? An end or a means? . . . Paganism and Christianity have each given a clear and definite answer. Paganism said that it was an end; Christianity replied that it was a means.'³

¹ Mr. Martin Wight comments on the original draft of this passage: 'Paganism came nowhere near the combination of political fanaticism and spiritual coercion which is the essence of a Modern Western "totalitarianism", for these are characteristic of a post-Christian Neo-Paganism—of the transfer of the religious "drive" and exclusive claims of Christianity to a debased secular creed, as you suggest on p. 554, below—which is indeed the supreme evidence, up to date, of a civilization of the third generation being a regression. Conversely it is very disputable whether Christianity can make an exclusive claim to the ideal of individual liberty. It certainly provided the milieu in which the Hellenic seed of individual liberty was able to germinate and come to flower in the Western Civilization; but in Eastern Christendom it did the reverse, and provided the milieu for the flowering of the older bulb of sacred monarchy, in which the unbiased reader of the Old and New Testaments and of the Fathers would be much more likely to see the natural political expression of Christianity than he would be likely to see it in any form of individual liberty. Christianity, in fact, seems capable of accommodating itself to any political régime: all that it asserts is that every political régime must be *responsible* to God, or (as Ferrero says) that the state, whether monarchic or democratic, is a means, not an end.'

'Indeed, are you not here evading the question whether "the ideal of individual liberty" is not precisely a feature of Modern Western secular civilization, i.e. of regression? Western Christendom, like Eastern Christendom, knew nothing of "individual liberty" except marginally in the Medieval Western city-state cosmos.'

The writer's answer to Mr. Wight's question would be that, in his belief, the Modern Western—in contrast to the Medieval Western—ideal of individual liberty on the secular plane had been derived from a Christian, not from an Hellenic, source. As he saw it, the Late Modern Western ideals of political and economic liberty were secularized versions of an Early Modern Western ideal of religious liberty for the individual conscience, and this ideal of liberty on the plane of religious practice and conviction had been inspired by the Christian belief in the value of every human soul in the sight of God, inasmuch as this belief could be taken to imply that no human authority—neither a church militant on Earth nor any secular potentate—had a right to intervene between an individual human soul and the God who had created it and had undergone an Incarnation and a Crucifixion for its sake. The writer agreed that this deduction from a universal and unquestioned Christian belief about the relation between human souls and God had not been drawn in Western Christendom before the Early Modern Age and had not been drawn in any of the other Christendoms independently at any time; but he would submit that it was a legitimate deduction and that, whether or not its legitimacy were admitted by other students of History, the deduction had at any rate been made in an Early Modern Western Christendom as a matter of historical fact.

While the writer of this Study thus held that the Modern Western ideal of individual liberty had a Christian root, he would agree that its severance from its Christian root, and its 'counter-transfiguration' into a secular ideal of individual liberty on the political and economic planes, had indeed been symptoms of regression; and in his view this secularized version of a Christian ideal was not only regressive; it was also untenable. In repudiating a religious sanction for individual liberty which had been provided by a Christian belief in the value of each and every soul in the sight of God, a post-Christian Modern Western *homo democraticus* had reduced his pretension to individual liberty *ad absurdum*; for the claims that were now being put forward by this *homunculus* merely in his own right, and no longer in God's name, could not stand against the claims of a totalitarian state to sacrifice the individual liberty of any and every *homunculus* on the altar of an idolized corporate humanity, the great beast-god Leviathan.

² See Ferrero, *op. cit.*, pp. 196-7.

³ *Ibid.*, p. 199.

The spiritual weapons, plucked from an Hellenic charnel house, with which Modern Western Man had brought to the ground the Hildebrandine *Respublica Christiana* had been as destructive as the material weapons with which Cromwell's soldiers had once shattered the west window of Winchester Cathedral.

'When ye shall see the abomination of desolation, spoken of by Daniel the Prophet, standing where it ought not (let him that readeth understand), then let them that be in Judaea flee to the mountains.'¹

Nevertheless, there is a bow in the cloud.² At Winchester, on the morrow of the Puritan iconoclast's deed, it must have looked as if a mighty work of Medieval Christian art had been utterly destroyed; and in truth it had been damaged beyond all possibility of reinstatement in its inimitable medieval pattern. Yet the broken and scattered fragments were pieced together again, by the piety of a later generation, in a labour of love that—sheer disorder though it might have suggested to the eye of the original artificer—was in truth a new pattern,³ fraught with unpremeditated beauty and letting in unforeseen light in the sight of eyes open to the self-revelation of a God who makes all things new.⁴ A boy once watched, spell-bound, while this miracle of creation conjured out of destruction⁵ was being lit up by the level radiance of a setting summer sun; and a man could catch a glimpse of the spiritual meaning of this visual allegory as he recalled it in his mind's eye in after-life, in the light of his generation's experience of a forty years' wandering in the wilderness. If the same sunlight could thus shine again through the same glass in a new pattern offering a fresh vision, might not the eternal and unchanging incorporeal light of the Beatific Vision again illuminate men's souls in a society that had been broken and remade by the sufferings of a Time of Troubles?

C. THE CHALLENGE OF MILITANCY ON EARTH

(I) CAUSES OF REGRESSION

IN the preceding chapter we have observed that a secular civilization that breaks out of a body ecclesiastic is apt to win its way with the aid of elements in the life of an antecedent civilization that it brings back to life; but, if we have seen here how an insurgent civilization takes advantage of its opportunity, we have still to see how the opportunity arises; and evidently this 'beginning of evils'¹ is to be looked for, not in the resourcefulness of the erupting civilization, but in some weak point, or false step, of the church at whose cost the eruption is achieved.

One formidable crux for a church is manifestly inherent in a church's *raison d'être*. A church is militant on Earth for the purpose of winning, or recapturing, This World for the *Civitas Dei* not by extinguishing life on Earth but by transfiguring it;² and this means that a church has to deal with secular as well as spiritual affairs and to organize itself on Earth as an institution, since this was the only method so far discovered by Man for managing mundane human relations on any scale beyond the narrow range of direct personal intercourse between one human being and another.³ The gross institutional integument with which a church thus finds itself compelled to clothe its ethereal nakedness, in order to do God's business in a recalcitrant environment, is as incongruous with a church's spiritual nature as the alien shell that is appropriated by a hermit crab; and it is not surprising to see disaster overtaking a terrestrial outpost of the Communion of Saints which, in This World, cannot do its own proper spiritual work without being drawn into grappling with secular problems and finding itself forced to attack these with institutional tools.

The most celebrated tragedy of the kind is the history of the Hildebrandine Papacy; and in another context⁴ we have observed how Hildebrand was dragged over the precipice by an apparently inevitable concatenation of causes and effects. He would not be a true and loyal servant of God if he did not throw himself, with all his might, into the spiritual task of trying to reclaim the Western Christian clergy from the sexual and financial corruption in which they were wallowing in his day; he could not reform the clergy if he did not effectively organize the Church; he could not effectively organize the Church without vindicating her lawful authority over the clergy in matters ecclesiastical; he could not do this without arriving at a demarcation between the respective jurisdictions of Church and State; and, since the field of the Western Christian clergy's activity in Hildebrand's day included some ground that was indisputably secular, and much ground that was debatable, besides the ground that was admittedly ecclesiastical, Hildebrand was led, by

¹ Thucydides, Book II, chap. 12.

³ See III. iii. 223-30.

² See V. vi. 149-68.

⁴ In IV. iv. 552-4.

a sequence of steps in which each step seemed to be necessitated by the preceding one, from inspiring a spiritual revival in Christian souls to engaging in a conflict with 'the Holy Roman Empire' which carried the Church right into the arena of power politics and was fought out, by force of arms, in successive rounds of ever-increasing intensity and embitterment, over a period of two centuries, with eventual results that were disastrous alike for a Medieval Western Christendom's two master institutions, the Papacy and the Empire, and, worst of all, for Western Christendom itself.

This tragedy of the Hildebrandine Western Church is a prominent, though by no means unparalleled, example of spiritual regression precipitated by a church's becoming entangled in mundane affairs and committed to secular modes of action unintentionally, and indeed against its will, as an incidental consequence of its doing its own business. There is, however, another broad road leading to the same spiritually destructive worldliness which is more frequented, more characteristic, and more insidious. A church incurs the risk of falling into a spiritual regression in the very act of living up to its own standards by striving sincerely to do God's will on Earth. For the will of God is partially expressed in the righteous social aims of the secular mundane societies, and these mundane ideals are apt to be achieved incidentally in a religious society very much more successfully than they ever have been, or can be, achieved in a mundane society which aims at these objects direct, and at nothing higher. This is a necessary consequence of one of the laws of life that we have observed in other contexts¹—the principle that the most likely way to reach a goal is to be aiming, not at that goal itself, but at some more ambitious goal beyond it—and, in the history of the Church Militant on Earth, two classic examples of the working of this law were the achievements of Saint Benedict and of Pope Gregory the Great.²

Both these saintly souls were bent upon the spiritual aim of promoting the monastic way of life in the West, and Gregory was also devoted to the further purpose—as unworldly as the other—of giving light to them that sit in darkness³ by bringing the heathen within the Christian Church's fold. Yet, as a by-product of their spiritual work, these two unworldly men of action performed economic prodigies that were beyond the powers of secular statesmen. Gregory incidentally saved from starvation the urban proletariat of Rome at a moment when the Constantinopolitan Government of an expiring Roman Empire was quite incapable of doing its duty by a derelict imperial city which, at the turn of the sixth and seventh centuries, was an exposed Western outpost of a once oecumenical Power whose frontiers had contracted till its centre of gravity now lay in Anatolia. And Gregory not only responded to the urgent challenge of an immediate economic emergency within the walls of the city that was the seat of his bishopric; in the same power of the same spirit, he and his hero Benedict between them laid, without intending it or knowing it, the firm religious foundations on which the

¹ See pp. 388 and 510, above.

² See III. iii. 265-9 and IV. iv. 184-5.

³ Luke i. 79.

immense edifice of a Medieval and a Modern Western economic life was subsequently erected. This incidental economic handiwork of two single-minded servants of God would be praised by Christian and Marxian historians alike with united voices, albeit with discordant minds. Yet, should these praises become audible to Benedict and Gregory in an Other World, these saints would assuredly recall, with a pang of misgiving, their Master's saying: 'Woe unto you when all men shall speak well of you';¹ and their misgiving would certainly turn to anguish if they were enabled to revisit This World and to see with their own eyes the ultimate moral consequences of the eventual economic effects of their immediate spiritual endeavours during their life on Earth.

The disconcerting truth is that the incidental material fruits of the spiritual labours of the *Civitas Dei* on Earth are not only certificates of its spiritual success; they are also snares in which a spiritual athlete who has been touched by the sin of pride, or has perhaps merely rested sluggishly on his oars,² may be trapped more diabolically than an impetuous Hildebrand is ruined by the spiritual disaster of entanglement in politics and war. In the medieval chapter of the Benedictine story, the Cistercian spiritual pioneers who founded their abbeys in a wilderness among the foothills of the Yorkshire Moors could hardly have foreboded that, in sacrificing themselves by seeking out this forbidding material environment, they were imperilling their successors' souls.

Was not the physical hardship of marooning themselves in this bleak landscape almost beyond endurance, even for a mortified monk? Was it not an edifying spiritual exercise to undertake, in faith, the humanly impossible task of making the desert rejoice and blossom as the rose?³ How could they have foreseen that they were giving the initial impetus to a wool industry and a metallurgical industry that would go from strength to strength till, seven hundred years from then, these economic exercises of aspirants to a spiritual prize would make England 'the workshop of the World'? How could they have foreseen that, within only three hundred years, a mounting material wealth that was the almost inevitable reward of spiritual virtue would be tempting their abbots to break their rule, in the spirit and even in the letter, by building massive meat-kitchens in their abbatial quarters as a witness against themselves? Or that, within four hundred years, the discredit brought upon the Order by such conspicuous sins against its professed ideals would be seized upon by a covetous laity as an excuse for despoiling the monasteries as Israel had spoiled the Egyptians? The unfolding tale had taught Posterity that material riches which can be harvested with impunity by saints who neither seek them nor value them nor notice them may be the undoing of clerics of common clay who covet them for their own sake and pursue them to the neglect of their spiritual calling.

'The gulf which appeared between abbot and convent was largely caused by the accumulation of wealth. As time went by, the estates of the

¹ Luke vi. 26.

² For these two alternative ways of incurring nemesis, see IV. iv. 245-61.

³ Isa. xxxv. 1.

monasteries became so enormous that the abbot found himself almost fully occupied in the administration of his lands and in the various responsibilities which this entailed. A similar process of division of estates and duties was taking place at the same time among the monks themselves. . . . Each monastery was divided into what were practically separate departments, each with its own income and its own special responsibilities. The officer in charge of each department was known as an 'obedientiary'. To him certain sources of income were assigned; he had his own household and servants; and the burden of his office was such as to occupy a very large part of his time. . . . Any monk of average intelligence and ability could count on receiving some form of office in due course, and . . . would spend a good many years of his monastic life in the administration of his department. . . .

As Dom David Knowles says: "Save in monasteries such as Winchester, Canterbury and Saint Albans, where strong intellectual or artistic interests existed, business of this kind was the career which absorbed all the talent of the house". . . .¹ For such as had administrative gifts, but were not blessed with any property on which to exert them, the monasteries, with their vast estates, offered much scope."²

Of such it is written that 'he . . . that received seed among the thorns is he that heareth the word; and the care of This World, and the deceitfulness of riches, choke the word, and he becometh unfruitful'.³ Yet the monk who has fallen out of the running in the race for a spiritual crown by degenerating into a successful man of business does not exemplify the most deadly form that spiritual regression can take. The worst temptation that lies in wait for citizens of the *Civitas Dei* in This World is neither to plunge into politics nor to slide into business but to idolize the terrestrial institution in which a Church Militant on Earth is imperfectly though unavoidably embodied. If *corruptio optimi* is *pessima*, an idolized church is the one idol that is more pernicious than the idolized human ant-heap that men worship as Leviathan.⁴

A church is in danger of lapsing into this worst of all forms of idolatry in so far as she lapses into believing herself to be, not merely a depository of truth, but the sole depository of the whole truth in a complete and definitive revelation of it.⁵ For the value of a vessel is proportionate to the value of its contents, and, if the contents are believed to be inestimably precious, the guardians of the vessel may rate so high the adventitious sacrosanctity of a paltry alabaster box that, rather than break it, they may sacrilegiously refrain, when their testing time comes, from using the spikenard for the divine purpose for which it has been entrusted to their keeping by God.⁶ The idolization of an ecclesiastical institution may be the outcome of a laudably prudent determination to preserve a divinely revealed truth by making sure that its earthly integu-

⁴ The idolization of institutions has been discussed in IV. iv. 303-423.

⁵ See Niebuhr, Reinhold: *Faith and History* (New York 1949, Scribner), pp. 238-40 and 242.

⁶ Mark xiv. 3-9. Cp. Matt. xxvi. 6-13; Luke vii. 36-50; John xii. 1-9.

ment shall be tough enough to outlast any mundane institution that might jeopardize the revelation by crushing its container. Yet, if the maker of the iron vessel falls down and worships his handiwork when it has duly proved itself more than a match for the colliding vessel of clay, it were better for him that he should never have purchased this material security for his spiritual treasure at so ruinous a moral cost.

A church is prone to set her feet on this easiest and sheerest of all the descents of Avernus when she has suffered some heavy blow, and particularly prone if the stroke has been struck by the members of her own household—who are proverbially a man's most grievous foes,¹ though their intimacy with their victim also makes them his shrewdest critics. The classic exemplar of this perhaps least readily retrievable form of regression had been the Counter-Reformational Tridentine Roman Catholic Church as non-Catholics saw her.² For four hundred years already, down to the time of writing, she had been standing on guard, in a posture that was as rigid as her vigilance was unrelaxing, massively armoured with the helmet of the Papacy and the breastplate of the hierarchy, and continually presenting arms to God in the recurrent rhythm of an exacting liturgy. In justification of her stand, this steel-clad figure could quote Scripture:

'For we wrestle not against flesh and blood, but against principalities, against powers, against the rulers of the darkness of This World, against spiritual wickedness in high places. Wherefore take unto you the whole armour of God, that ye may be able to withstand in the evil day, and, having done all, to stand.'³

The subconscious purpose of this heavy institutional panoply in which the Tridentine Church had encased herself was assuredly a determination to outlast the very toughest of the contemporary secular institutions of This World—above all, the upstart civilizations of the third generation. In the twentieth century of the Christian Era a Catholic critic of the Reformation could argue with force, in the light of four hundred years of Protestant history, that a Protestant impatience of even the lighter equipment of pre-Tridentine Catholicism had been premature. Yet that verdict, even if cogent, would not prove either that the casting off of impedimenta would always be a mistake or that the Tridentine multiplication of them had not also been an error. Institutional armour is possibly an indispensable means of survival for a Church Militant on Earth, but it is none the less certainly a mundane embarrassment which makes the Church Militant by that much spiritually inferior to the Kingdom of Heaven, where 'they neither marry nor are given in marriage, but are as the angels',⁴ and where each individual catches God's spirit from personal communion with Him, 'like light caught from a leaping flame'.⁵

The awe inspired by the spectacle of Tridentine Catholicism in the heart of a twentieth-century Christian observer of a different persuasion

¹ Matt. x. 36, following Micah vii. 6.

² Catholics, of course, did not admit that their devotion to their church amounted to an idolization of her.

³ Eph. vi. 12-13.

⁴ Mark xii. 25.

⁵ Plato's Letters, No. 7, quoted in III. iii. 245, and on p. 525, above.

was tempered by reminiscences of an Assyrian 'corpse in armour' standing magnificently but not invincibly at bay in the breach at Nineveh in 612 B.C.¹ and of long since extinct giant reptiles which had 'swelled and hardened up to their doom'² by assiduously reinforcing their carapaces, plate upon plate, till they had condemned themselves to stagnate 'awash in pools where water would bear some of their otherwise crushing weight.'³ In the museums of a latter-day Western World the fossilized bones of the dinosaurs and the cap-à-pie steel carapaces of fifteenth-century Western men-at-arms bore concordant witness that 'there is no armour against Fate';⁴ and the same truth was advertised in the spectacle of a derelict Great Wall of China and of desolate termite-built towers of Babel that would surpass the Great Pyramid in massiveness and the Empire State Building in height if translated into human dimensions, scale for scale.⁵

'A social pattern no longer open to change has, in fact, quite unconsciously signed its own death warrant. Just at the very moment when the system seems most perfected, when the structure seems most complete, and when inner peace and harmony seem to give the way of life a kind of perfection, the cracks in the structure make their appearance, the fission becomes evident, and the changes so long resisted precipitate a cataclysm.'⁶

The verdict⁷ upon the idolization of an institution, ecclesiastical or secular, is: 'Whosoever will save his life shall lose it.'⁸

We have now laid our finger on some of the causes of regression from higher religions to vain repetitions of secular civilizations, and in each case we have found that the calamity is precipitated, not by a *saetva necessitas*⁹ or any other external force, but by an 'Original Sin' which is innate in a terrestrial Human Nature.¹⁰

⁷ Mr. Martin Wight comments: 'A Roman Catholic critic would reply to you here, in words that you so often quote, "Respicere finem". The whole of the foregoing passage is anticipation: it has not yet come true. Is it not the fact that the Roman Church is incomparably more vigorous and influential in the twentieth century than at any time since the Council of Trent? Whereas in 1870 it inscribed the Infallibility of the Pope among its dogmas, at the apparent nadir of its fortunes, as an act of defiance, in 1950 it was able still further to scandalize a secular Western World by adding the dogma of the Assumption of the Virgin as an act of self-confidence. Is it not equally likely, at the time of writing, that the Roman Church in its Tridentine panoply will be the only Western institution capable of challenging and withstanding the neo-pagan totalitarian Communist state, and is not this borne out by the particular fear and hatred with which Moscow regards the Vatican? If this be so, the figure of the dinosaur's carapace will be less apt than that of a long and successfully sustained siege, and the Tridentine phase of Catholic history may appear in retrospect like the Churchillian phase of British history from the fall of France to D-Day. You prejudice the outcome. "Respicere finem".'

A Catholic friend of the writer's comments on the same passage: 'The odd thing about the post-Tridentine and twentieth-century Catholicism, surely, is its eternal youth—the wonderful sprouting of new orders and congregations of both religious and lay folk: the "Jocists", the Grail, the "Pays de Mission" priests in the banlieue of Paris, the Society of the Divine Word (Pater Schmidt and the Chinese cardinal). Even at the time of the Counter-Reformation itself there had not been such a flourishing of mystics.'

(II) THE BOW IN THE CLOUD

(a) AUGURIES OF SPIRITUAL RECOVERY

If regressions from higher religions are effects of Original Sin, are we driven to conclude that, since Original Sin is reborn into This World at the birth of every new-born child,¹ such regressions are inevitable? If they are, this would mean that the challenge of militancy on Earth was so prohibitively severe² that no church would ever be capable of standing up to it in the long run; and that conclusion, in turn, would drive us back towards the view that the churches are good for nothing better than to serve as ephemeral chrysalises for vainly repetitive civilizations.³ Is this the last word? Before we resign ourselves to a suggestion that God's inflowing light is doomed to be perpetually overwhelmed by an uncomprehending darkness, let us cast our eyes back once again over the series of spiritual illuminations brought into the World by the epiphanies of the higher religions; for these chapters of past spiritual history may prove to be auguries of spiritual recovery from the regressions to which a Church Militant is prone.

We have noticed⁴ that the successive milestones in Man's spiritual advance that are inscribed with the names of Abraham, Moses, the Prophets, and Christ all stand at points where a surveyor of the course of secular civilization would report breaks in the road and breakdowns in the traffic; and the empirical evidence has given us reason to believe that this coincidence of high points in Man's religious history with low points in his secular history may be one of the 'laws' of Man's terrestrial life. If so, we should expect also to find evidence of the working of a converse 'law' that the high points in secular history coincide with low points in religious history, and that the religious achievements that accompany mundane declines and falls are therefore not merely spiritual advances but are also spiritual recoveries. They are, of course, presented as recoveries in the traditional version of the story.

'The call of Abraham', for example, which the recent discoveries of our Modern Western archaeologists have enabled us to locate, in our chart of secular history, as a spiritual accompaniment to the secular catastrophe of the downfall of the Empire of Sumer and Akkad, is presented in the Hebrew legend as a sequel—which was God's opening move for the redemption of Mankind from the consequences of the Fall of Adam—to a defiance of God by the self-confident builders of a mundane Tower of Babel.⁵ The mission of Moses which, in the same secular chart, appears as an accompaniment of the comparable secular calamity of the break-up of 'the New Empire' of Egypt, is presented in the legend as a move to rescue God's Chosen People from a spiritually unpropitious enjoyment of the flesh pots of Egypt in her heyday by

¹ 'Ethics, like backbones, come out of non-existence into existence *de novo* in each individual development' (Huxley, Julian: *Evolutionary Ethics*, the Romanes Lecture, 1943, reprinted in Huxley, T. H. and J.: *Evolution and Ethics*, 1893-1943 (London 1947, Pilot Press), p. 107.

³ This view has been examined on pp. 392-419, above.

⁴ On pp. 423-5, above; see also pp. 701-2 and 762, below.

⁵ Gen. xii. 1-6, against the background of Gen. xi.

exposing them to the spiritually fortifying experience of hungering and thirsting in the wilderness.¹ The Prophets of Israel and Judah, whose *floruit* is located by the secular historian in the Time of Troubles of a broken-down Syriac Civilization, were moved by a compelling concern (which, in their own belief, was a divine command) to preach to their countrymen a repentance from the spiritual backslidings into which Israel had lapsed when he had broken out of the wilderness into a land flowing with milk and honey which had not yet been blighted by Assyrian militarism. The Ministry of Christ, whose Passion, as a secular historian sees it, is fraught with all the anguish of an Hellenic Time of Troubles, is presented in the Gospels as an intervention of God Himself for the purpose of extending to the whole of Mankind a covenant previously made by God with an Israel whose epigoni in Jesus' generation had alloyed their spiritual heritage with a Pharisaic formalism, a Sadducean materialism, an Herodian opportunism, and a Zealot fanaticism.

On this showing, four blazing outbursts of spiritual illumination had been sequels to spiritual eclipses besides having been accompaniments of mundane disasters, and we may surmise that this sequence of spiritual recoveries had been something more than a happy chapter of accidents. In another context² we have observed that physically hard environments are apt to be the nurseries of mundane achievements, and, on this analogy, it is to be expected that spiritually hard environments will have a correspondingly stimulating effect in the field of religious endeavour. A spiritually hard environment may be defined as being the atmosphere of 'the city of swine'³ in which the Soul's spiritual aspirations are swamped by material well-being. This Circe's magic is too much for the general run of Mankind; and in such adverse spiritual circumstances a majority is apt to find its way, like Odysseus' shipmates, into the sorceress' pigsties. Yet all is not lost; for the miasma of worldly prosperity that stupefies the mass will provoke spiritually sensitive and strenuous souls into an utter defiance of the charms of This World. Even on the relatively low level of barbarian virtue, the fortitude of a single hero may avail, as Odysseus showed, to save the situation; and at the level of the higher religions the failure of the priest is the signal for the prophet.

We have noticed, in passing,⁴ the classic case of the early Christian martyrs who bade defiance to the bourgeois comfort and security of a Trajanic, Hadrianic, and Antonine Age by insisting on sacrificing their lives for a moral punctilio. Their spiritual heroism outraged pagan contemporaries who would fain have made believe that a transient 'Indian Summer' was not October but June, yet were uneasily aware that the Christian martyrs' apparently fantastic *contemptus mundi* was inspired by a devastating insight. The same insight was displayed by Saint Francis of Assisi when he revolted, in disgust and alarm, against the empty life of luxury that his purse-proud father had provided for him,

¹ See II. ii. 24-25.

² In II. ii. 31-73.

³ Plato: *Respublica*, 369B-372D, cited in II. i. 193, n. 1, and II. ii. 23, n. 2.

⁴ In IV. iv. 60-61.

and raised the rebel standard of Holy Poverty against a bourgeois prosperity that, in the Medieval Western Christendom of his day, was still only in its budding infancy. Saint Francis' father was the prototype of the commercially successful Western business man who was to inherit the Earth in the course of the next seven centuries; and, in an epoch in which *Homo Economicus Occidentalis* was thus going from strength to strength, it exasperated him to hear the Franciscan repetition of Saint Gregory's cry: 'Behold, the World that commands our love is fugitive!'¹ Yet, some eight hundred years after Pietro Bernardone's day, the apparently boundless vista of material progress, that had displayed itself as alluringly as ever to a twelfth-century Umbrian clothier's nineteenth-century English and American successors, had been effaced by the grimly different prospect that Saint Gregory had once depicted.

'To-day there is on every side death, on every side grief, on every side desolation; on every side we are being smitten, on every side our cup is being filled with draughts of bitterness. Yet the lusts of the flesh so blind our spirit that even a world that has turned bitter still charms us. We pursue it as it flees from us; we cling to it as it collapses; and, since we cannot arrest its collapse, we are sinking with it while we hold on to it in its fall. Once upon a time this world could hold us by its sheer attractiveness; to-day this poor world is so riddled with such fearful afflictions that the World itself now drives us into the arms of God.'²

Saint Gregory had divined that souls alienated from God by mundane prosperity might be reconciled to God by the agony of seeing an earthly paradise turn to dust and ashes. As the light of common day faded away into the darkness of night, the clouds of glory might shine out again. Was the experience of sixth-century Rome an augury for a twentieth-century world? In the twelfth-century springtime of Western mundane prosperity the vision of Saint Francis had been out of range of the spiritual capacity of *l'homme moyen sensuel*, as the vision of the martyrs Nereus and Achilles had been in the second-century 'Indian Summer' of Hellenism. But might not the pelting blows of mundane adversity avail to strike the scales from off the eyes of the grandchildren of Silas Lapham,³ as dumb sermons in stones had once opened the eyes of Gregory's congregation to the truth which the pastor of their souls was preaching to them among the ruins of Imperial Rome? If the Palaeo-Paganism of the aeon of human history before the epiphany of the higher religions had never been able to extinguish a spark of True Religion that lay smothered in pagan souls,⁴ and if the crashing fall of the civilizations of the second generation had stimulated this long-hidden spiritual fire to burst out into a blazing flame, was it likely that a latter-day Neo-Paganism would be capable of putting out the conflagration?

This 'vain repetition of the heathen'⁵ lacked the stability and the

¹ 'Ecce mundus qui diligitur fugit' (Saint Gregory the Great: 'Sermo Habita ad Populum in Basilicâ Sanctorum Nerei et Achillei, Die Natalis Eorum', in *Homiliae Quadraginta in Evangelia*, No. xxviii (Migne, J.-P.: *Patrologia Latina*, vol. lxxvi, col. 1212), from which other sentences have been quoted in IV. iv. 60-61).

² Saint Gregory, op. cit., partly quoted already in loc. cit.

⁴ See pp. 759-68, below.

⁵ See pp. 446-7, above.

staying-power of its palaeo-pagan prototype, in the measure in which it surpassed a Palaeo-Paganism in driving-force; and in this last respect the difference between these two generations of Paganism was great indeed. The Neo-Paganism was a high-powered enormity¹ charged with the spiritual potency of higher religions whose place this Abomination of Desolation had sought to usurp; and this spiritual force was much greater than that of a pristine pagan Human Nature; for, if it is true that 'human passions are always characterised by unlimited and demonic potencies of which animal life is innocent',² this is true *a fortiori* of human passions reinforced by a powerful higher religious inspiration.

On the morrow of a Second World War, this daemonic goad was threatening to drive a Westernizing World into the supreme public crime and catastrophe of physical self-destruction through a third world war waged with atomic weapons; but this appalling prospect was merely the unveiling of a goal towards which a secularized Western Society had been heading ever since it had erupted out of a medieval *Respublica Christiana*. This terminus of the broad road along which he was travelling had not caught the eye of Modern Western Man during the deceptive interlude of prosperous mundane progress that had begun with the ending of the Western Wars of Religion and had continued until August 1914. Secular-minded Westerners who had lived and died in those halcyon generations had imagined that their utilitarian version of Neo-Paganism, in which all 'enthusiasm' was anathema, was the impregnable essence of their agnostic faith, whereas in reality this low temper was no more than a temporary reaction against the effervescent ferocity of the Wars of Religion. In the Western 'Age of Reason' this ferocity had been driven underground without being eradicated from Western souls; and it was to erupt again, with a force accumulated through a long repression, in the ensuing 'Age of the Wars of Nationality and Ideology'.

After a Second World War a world that was being secularized in the process of being Westernized was faced with a choice between two alternative possibilities. One possibility was that the vicious momentum of a Neo-Paganism that had run away headlong with the bit between its teeth might carry a Westernizing World over the precipice that had been the bourne of all other civilizations known to History; and in that event the flame of Religion might flare up again out of the wreckage as it had once burst out of the ruins of a Hellenized World. The other possibility was that neo-pagan souls might be smitten with a creative contrition, as well as with an unnerving dismay, by the revelation of the destructive powers and impulses which their reactionary religion had evoked in them, and that they might seek salvation—and haply find it—by turning again to the divers higher religions in which their fathers had received partial revelations of the Beatific Vision.³ In the catastrophic event, Man would be relieved of further spiritual responsibility at the cost of

¹ The particular sense in which the word 'enormity' is used in this Study has been defined in IV. iv. 133-7.

² Niebuhr, R.: *The Nature and Destiny of Man*, vol. i (London 1941, Nisbet), p. 191, quoted on p. 508, above.

³ See pp. 442-3, above, and pp. 716-36, below.

physical annihilation; but if he took the alternative and less melodramatic course he would have to abide a bout of those perplexing and tormenting questions that are the salt of spiritual life.

In returning to Religion, would a neo-pagan soul be finding her way back out of the broad way that leadeth to destruction into the narrow way which leadeth unto life?¹ Or would she be merely burying herself in a blind alley? Should she hearken to a voice saying, 'See, I have set before thee this day life and good, and death and evil',² and to an oracle declaring 'Except a man be born again, he cannot see the Kingdom of God'?³ Or should she be influenced by the jibes of Mephistopheles pointing out that, whether or no a man can enter the second time into his mother's womb and be born,⁴ a baby kangaroo is certainly not entering into the Kingdom of God⁵ when it creeps back into the cosy physical *Nirvāna* of its mother's pouch. Was the still small voice luring the Soul into a sluggard's *Faulbett*,⁶ or was it calling it to Eternal Life? That was the fateful question to which Mankind would have to find its answer, if Mankind survived.

(b) POSSIBILITIES OF SPIRITUAL GROWTH

Would a return to Religion be a signal spiritual advance? Or would it be an abject and inept attempt at an impossible evasion of the hard facts of Life as we know it? Our answer to this question will partly depend on our estimate of the possibilities of spiritual growth in This World.

In a previous chapter⁷ we have touched upon the probability (as it appeared to be on the morrow of a Second World War) that the literally world-wide expansion of a secular Modern Western Civilization would translate itself into political form at no distant date through the establishment of a universal state which would fulfil at last the ideal of a polity of this species by embracing the entire habitable and traversable surface of the planet in a commonwealth that would have no physical frontiers because it would have no neighbours. In the same context⁸ we have considered the possibility that, within some such literally oecumenical mundane framework, the respective adherents of the living higher religions might come to recognize that their once rival forms of worship were so many alternative approaches to the One True God along avenues offering divers partial glimpses of an identical Beatific Vision. The differences between the divers religions, and between the divers sects of each religion, which had so long been stumbling-blocks for faith and targets for the sceptic's arrows, might then prove to correspond to differences between divers psychological types of Human Nature which required a diversity of spiritual means and methods if they were to arrive at an identical spiritual goal.⁹ We threw out the idea that, in this light, the historic living churches might eventually give expression to the unity in their diversity by growing together into a single terrestrial

Church Militant. Supposing that this were to happen, would it mean that the Kingdom of Heaven would then have been established on Earth? In a Westernizing World in the twentieth century of the Christian Era, this was an inevitable question, because some kind of earthly paradise was the goal of most of the current secular ideologies. If this question were to be answered in the affirmative, that would, in the writer's belief, be a misconception which would give Mephistopheles an opening for sarcasm and Mankind an occasion for disillusionment. In the writer's belief, however, the true answer was in the negative, and this for several reasons.

One manifest reason was exhibited by the nature of Society and the nature of Man. Society is nothing but the common ground between the fields of action of a number of personalities;¹ and human personality, at any rate as we know it in This World, has an innate capacity for evil as well as for good. This meant, as we have often observed,² that, in any terrestrial society, unless and until terrestrial Human Nature should undergo a moral mutation which would make an essential change in its character, the possibility of evil, as well as of good, would be born into the World afresh with every child, and would never be wholly ruled out as long as that person remained alive. The challenge, ordeal, struggle, and drama of Man's spiritual life repeat themselves in the experience of each single soul—in contrast to the impersonal accumulation and transmission, from one generation to another, of Man's scientific knowledge and technical 'know-how'.³ This was as much as to say that the replacement of a multiplicity of civilizations and a diversity of higher religions by a single Church Militant on Earth would not have purged Human Nature of Original Sin; and this moral limitation on the possibility of perfection in This World had a political implication which limited the possibility still further. So long as Original Sin continued to be an element in terrestrial Human Nature, there would always be work in This World for Caesar to do; and, since the labourer is worthy of his hire,⁴ and thankless tasks command high salaries, there would still be Caesar's things to be rendered to Caesar, as well as God's things to God.⁵ Human Society on Earth would not be able wholly to dispense with institutions; and, since institutions are relations between human beings that extend beyond the narrow range of a direct personal intercourse in which love can make regulation superfluous,⁶ an institution can never be founded entirely on the voluntary basis of the individual's will to make it work. If it is to be a going concern, it must be reinforced by habit and be backed, in the last resort, by the sanction of force. In fact, institutions are perfect reflections of the moral imperfection of Human Nature; and these social products of Original Sin would always have to be administered by a secular arm.

A state of society in which this secular power would be subordinated to the ecclesiastical would be a higher and a happier dispensation than a 'Caesaro-papal' absolute régime in which there would be no dis-

⁶ See I. i. 454-5.

inction between the Church and the secular community; but to subordinate the secular power would not be to eliminate it; and, if the Church did seek to eliminate the State altogether, she would be defeating her own highest purposes; for Caesar *gleichgeschaltet* would live on underground in the constitution of his ecclesiastical supplanter, and a prison-house of totalitarianism that had been broken open by the Church's emancipation from the State would be reconstituted through the Church's false step of usurping the State's place instead of being content simply to vindicate her own. In looking into the causes of regression,¹ we have seen the Hildebrandine Church drawn into the arena of power politics—with tragic consequences for Western Christendom as well as for the Church herself—merely through a dispute over the line of demarcation between the ecclesiastical and the secular domain; and we have seen the Tridentine Church exposing herself to a risk of incurring the doom of Lot's wife through putting too much of her treasure into her concern to save her life as a terrestrial institution.²

The historic tragedy that had overtaken a Medieval Western Christian Church as the penalty for fighting Caesar with mundane weapons gave some inkling of the fate that a church would bring upon herself if she were to go to the length of stepping outright into Caesar's blood-empurpled shoes; and so, even if a united and concordant Church Militant were to have won a fully world-wide allegiance and to have entered into the heritage of the last of the civilizations, the Church on Earth would not be a perfect embodiment here on Earth of the Kingdom of Heaven. The Church on Earth would still have sin and sorrow to contend with as well as to profit by as a means of grace in a world where learning comes through suffering, and she might find herself unable, for a long time to come, to divest herself entirely of her historic panoply of ecclesiastical institutions. Some residue of her ancient institutional armaments would remain indispensable to her so long as she had to go on struggling for mundane survival; but a still necessary incubus would none the less inevitably still weigh her down—as

¹ On pp. 545–50, above.

² Mr. Martin Wight comments: 'On p. 549, above, your criticism of the Tridentine Church is that it has encased itself in "institutional armour". But institutional armour is not a weapon peculiar to Caesar: as you say above on p. 545, a church has to act and exist institutionally as well as a secular society. To this extent, therefore, the Church is not "fighting Caesar with his own weapons" in the implied sense of weapons to which she is not herself entitled. But further: the characteristic weapons of the Tridentine Church have been: (i) the tightening up of dogma, from the Creed of Pius IV down to the definition of 1950; (ii) the Holy Office and the Index, for the suppression of heresy; (iii) the founding of new orders [of religious], of whom the Jesuits (though chronologically they are just pre-Tridentine) are the most important. Now, none of these were "Caesar's weapons". Indeed the relationship is exactly the reverse: (ii) and (iii) are weapons which have made such a strong impression on Caesar that in his new totalitarian mood he has set about imitating them for his own purposes, in the shape of secret police, censorship, storm-troopers, and stakhanovites. It is therefore rather a case of Caesar fighting the Church with the Church's weapons (compare what you say above, on p. 554). And, if you reply that the Church had no business to use weapons like the Inquisition and the Index in the first place, that is a point certainly on which Christians will legitimately differ (and I will tend to agree with you); but are not (i) and (iii) the appropriate, indeed the ultimate, weapons of any Church?'

As regards (i), the writer of this Study would refer to what he has said about Theology in previous chapters of this Part.

Christian was oppressed, till an advanced stage of his painful pilgrimage, by the burden of sin that still lay bound upon his back.

A socially victorious Church Militant, contemplating this forbidding prospect, might hear the insidious voice of Mephistopheles whispering 'defeatism' in her ear. 'I suspect you are beginning to realize,' the tempter might insinuate, 'that your victory is an illusion. It could never, of course, have been anything else; for, after all, you had set yourself, hadn't you, an impossible task. "Thy Kingdom come! Thy will be done in Earth as it is in Heaven!" Why, that is the very definition of just what is inherently unattainable. Who lives in Rome must do as Rome does; and in This World, which is Mankind's concentration camp, there are only two alternative practicable courses of action for Man to choose between (a prisoner is lucky to have a choice, even if only between two extremes). Man can either put the whole of his treasure in This World, or can withdraw his last farthing from his terrestrial banking account. Bet your life on This World, and you can throw yourself wholeheartedly into the satisfying enterprise of turning a prison-yard into an earthly paradise; give up This World as a bad job, and you can detach yourself from mundane entanglements with a no less satisfying singleness of mind. In either of these directions there is an open road, but surely you can see that there is no middle course. If you had paid more attention to History, you would have observed that the whole of this very tricky *terrain* had been reconnoitred long ago by earlier pioneers. The way of detachment has been surveyed—yes, and traversed too—by Epicurean, Stoic, and Buddhist philosophers; the trail leading towards an earthly paradise has been blazed by those practical men of action who have discovered the secret of tapping organized collective human power. The facts are public knowledge, yet you have light-heartedly ignored them. What levity! What impudence! You have been just asking for disillusionment. No wonder you are down in the mouth!'

In this Mephistophelian attack on the ideal of a Church Militant on Earth the one true statement is that the topic is familiar ground. We have explored it already¹ in surveying the alternative ways of life—the ways of Archaism, Futurism, Detachment, Transfiguration—that present themselves to souls challenged by the disintegration of a mundane society, and we have discovered that there is no salvation for the Soul in seeking either an earthly paradise or a *Nirvāna*. Salvation is to be sought and found in a transfiguration of This World by an irradiation of the Kingdom of God—an intellectual paradox which is an historical fact. The truth is that This World is neither a kingdom for Leviathan nor an irreclaimable spiritual wilderness, but a province of the Kingdom of God. It is a rebellious province which has been betrayed by the sin of pride into ungratefully and unlawfully declaring its independence and has thereby brought upon itself the self-imposed penalties of misrule and distress; but this act of rebellion has neither invalidated God's sovereignty nor alienated His love, and He is concerned to re-inaugurate His rule—not because He has any need of this insignificant province's products and revenues, but because His compassion for His creatures

¹ In V. vi. 49-168.

makes Him yearn to redeem them from their self-inflicted sin and suffering.

'How think ye? If a man have an hundred sheep, and one of them be gone astray, doth he not leave the ninety and nine, and goeth into the mountains, and seeketh that which is gone astray? And, if so be that he find it, verily I say unto you, he rejoiceth more of that sheep than of the ninety and nine which went not astray. Even so, it is not the will of your Father which is in Heaven that one of these little ones should perish.'¹

The human shepherd has to rescue his lost sheep by an act of power in which the dumb animal plays a purely passive part; but God's human flock has gone astray, not by innocent misadventure, but by a rebellious act of will which a repressive act of power could override but not reverse. Man's rebellion against God can only be extinguished by a conversion of the rebel's heart.

'I say unto you that . . . joy shall be in Heaven over one sinner that repenteth, more than over ninety and nine just persons which need no repentance.'²

God's province in This World has to be reclaimed by a divine king who wins the sinner's heart by becoming incarnate and by dying for him on the Cross; and Christ's work has to be followed up by representatives of a Church Militant that is in the World yet not of it.

'The direct identification of the Church, as an organised institution taking its part in the process of history, with the Kingdom of God . . . is just as bad theologically as the view which regards the Church as a mere instrument in preparation for the Kingdom of God. The only wholesome view is one which regards it as being constituted as the Church by the powers of the Kingdom of God within it, and yet as being always composed of people still citizens of This World; so that those powers manifest themselves partially and fitfully, and the historical Church is a mixed body.'³

In mundane history the device of dual citizenship had been a stroke of genius that had made unity in diversity practical politics at the cost of putting an exacting psychological strain on the citizen who had to reconcile his two allegiances. This had been the *arcanum imperii* of the Roman Commonwealth and of every parochial federal state in the Hellenic and in the Western body social. In the divine government of the *Civitas Dei* the same method had been used for the higher purpose of bringing back a dissident province into conformity with God's will through a voluntary return of rebel souls to their pristine allegiance; and the tension was proportionately greater in the souls of God's human agents who, in order to do His will by serving Him in His work of reclamation through love and not through force, had to live, so long as they were on duty in this arduously pacific campaign, as citizens of This World and of the *Civitas Dei* simultaneously.

The citizen of This World who has deliberately repudiated his

allegiance to God, or has never been aware of being the lawful subject of a heavenly sovereign, can make the best of This Life under the consoling illusion that he is living in the best of all possible worlds; but the citizen of This World who is loyal to his higher allegiance is bound in consequence to feel—and to suffer through feeling—that, in working for God in This World during a spiritual Time of Troubles that is coeval with terrestrial history, he is living and breathing in an element that is not native to his soul—like a diver working at sea-bottom on the salvaging of a foundered ship, or like the denizen of a Mediterranean *dólina*¹ who, in the fantasy of a Platonic myth, one day finds his way up to the true surface of the Earth.

‘In my belief the Earth is of a vast order of magnitude, and only a tiny fraction of it is accounted for by the habitat of those of us who live between the Straits of Gibraltar and the eastern end of the Black Sea (τοὺς μεχρὶ Ἡρακλείων στηλῶν ἀπὸ Φάσιδος). We live round this [Mediterranean] sea like ants or frogs round a pond; and no doubt there are many other human societies living in many other similar localities in other parts of the World. All over the World there must be many such *dólinas* of divers forms and sizes, in which water, fog and air have collected. The Earth itself, though, stands clear in that clear sky which contains the stars and which goes by the name of Aether in the standard vocabulary of the astronomers. The *colluvies* that is perpetually collecting in the Earth’s *dólinas* is the Aether’s sediment. We denizens of the *dólinas* imagine, in our ignorance, that we are living on the Earth’s surface, as some denizen of the bottom of the Sea might imagine that he was living on the Sea’s surface and might suppose that the Sea was the Sky because he could see the Sun and the rest of the stars through the water. I am assuming, of course, that he is too sluggish and feeble ever to have been able to reach the surface, emerge, poke his head out of the Sea into our habitat, and behold how much clearer and lovelier this is than his own; I am also assuming that he has never heard of our habitat at second hand. Well, we are in precisely the situation of my imaginary inhabitant of the Sea. Living, as we live, in a *dólina*, we imagine ourselves to be living on the Earth’s surface, and we call the Air the Sky, under the illusion that this Air is the medium—which can only be the Sky—through which the stars are travelling in their courses. The reality, though, is the same in our actual case as in my imaginary one. We are too feeble and sluggish to be capable of making our way out into the stratosphere; but, if anyone *could* reach its upper limit—for instance, by contriving to fly—and could then poke his head out, he would see the counterpart of what fish see here when they poke their heads out of the Sea and behold our habitat. If he had the stamina to endure this beatific vision, he would recognise that these are the true Sky and the true Light and the true Earth.’²

This Platonic conceit is an apt simile of Life on Earth. An earth-bound citizen of This World is the unsuspecting prisoner of his inferior habitat; an involuntary citizen of This World who is at the same time a conscious and active citizen of the *Civitas Dei* is like the fish which has put its head out into the Air or the flying man who has put his head

² Plato: *Phaedo*, 109.

out into the Aether. The soldier serving in the Church Militant on Earth knows that This World is a spiritual battlefield that is not his spiritual home.

'It is written of Cain that he founded a commonwealth; but Abel—true to the type of the pilgrim and sojourner that he was—did not do the like. For the Commonwealth of the Saints is not of This World, though it does give birth to citizens here in whose persons it performs its pilgrimage until the time of its kingdom shall come—the time when it will gather them all together.'¹

If we adopt this Augustinian Platonic *Weltanschauung* as our own and attempt, in the light of it, to envisage terrestrial history *sub specie aeternitatis*, what significance shall we find in the idea of progress in This World?

In the Age of the Civilizations, progress, in so far as human minds had entertained this idea at all, had often been identified with the progressive improvement of some terrestrial institution: a tribe, a city-state, an empire, a church, a system of knowledge or 'know-how', a school of art, a code of morals. If this conception of the meaning of progress were credible to the pilgrim-citizens on Earth of the *Civitas Dei*, they would indeed be of all men most miserable,² since they are aware that, in a terrestrial life infected with Original Sin, neither souls nor institutions can carry progress to perfection, and are also aware that, whatever may be the ultimate destiny of souls, institutions are earth-bound creations of Man in an imperfect world whose limitations they can never transcend.³ We have seen, in fact, that the idolization of institutions is an intellectual and spiritual error that entails the nemesis of social disaster, and that the self-inflicted penalty for this perversity is the greater, the nobler the institution that is sacrilegiously taken as a substitute for the One True God.⁴ The last word on all institutions had been pronounced in the verdict on one master-institution which the Gospel attributed to Christ: 'And he said unto them: The Sabbath was made for Man, and not Man for the Sabbath.'⁵ Man was not made for the Sabbath or for any other institution because Man was made for God. 'Thou hast made us for Thee, and our heart is unquiet until it finds rest in Thee.'⁶ The touchstone of the value of an institution is whether it helps or hinders Man to find his way back to his Maker, and an institution will become an obstacle to Man's true end of glorifying God and enjoying Him forever if it is taken as being an end in itself instead of being used as the mere means that is all that it truly is.

But, if institutions are means and not ends, what is the significance and the purpose of the social heritage, far transcending the temporal and spatial limits of any single human life on Earth, which institutions

¹ Saint Augustine: *De Civitate Dei*, Book XV, chap. 1, quoted in V. vi. 366.

² 1 Cor. xv. 19.

³ If the writer of the Book of Revelation had been the denizen, not of a circum-Mediterranean Roman Empire, but of a twentieth-century Westernizing World, his wishful thought in chapter xxi, verse 1, would assuredly have been 'there were no more institutions' instead of 'there was no more sea'.

⁵ Mark ii. 27.

⁶ 'Fecisti nos ad Te, et inquietum est cor nostrum donec requiescat in Te' (Saint Augustine: *Confessions*, Book I, chap. 1).

embody, preserve, and transmit? All men of good will feel that it is God's will that, in their transit through This World, they should spend themselves in labouring for other human beings, living in distant places or destined to be born at remote future dates, whom they will never meet in the flesh; their only means of serving these unknown brethren of theirs is to make their mark for good on Man's social heritage by leaving some institution better than they found it; and they not only feel that this terrestrial duty is compatible with their allegiance to the Kingdom of God; they feel that they would be traitors to the *Civitas Dei* if they held back from playing their part in establishing its rule in the form of a terrestrial Society in an imperfect world through which they are making their brief pilgrim-passages. Is there any solution of this apparent contradiction?

A first step towards resolving it is to remind ourselves that in This World, as in the rest of the Kingdom of God, all spiritual reality, and therefore all spiritual value, resides in persons; for this means that a social heritage which alienates souls from God and leads them to disaster, when it is idolized as an end in itself, has a legitimate use and a genuine value in so far as it is dedicated to a beneficent service for individual human beings in their brief lives on Earth. Improvements in this social heritage, which register social 'progress', are to be estimated and valued according to their effect in increasing the possibilities for individual human beings in This World to live good lives. In taking this as the criterion of progress, the adherents of the higher religions will have the suffrages of any pagans who are innocent of Leviathan-worship; but, whereas a good pagan will work for an improvement in material opportunities for individual human beings through an enrichment of the social heritage in terms of mundane values, the pilgrim-citizen on Earth of the Kingdom of God will work to enrich the social heritage in terms of spiritual values in the hope of thereby helping God to create opportunities for souls to come nearer to doing His will during their transits through This World.

Servants of God will be aware that spiritual progress, in this sense, will incidentally bring mundane progress in its train. 'Seek ye first the Kingdom of God and His righteousness, and all these things shall be added unto you.'¹ They will also be aware that, on the principle of Solomon's Choice, the mundane progress that will be made in this incidental way will be far greater than the utmost that could be attained by aiming direct at a mundane goal.² But they will never lose sight of the truth that, in praying for progress in This World in the words 'Thy Kingdom come, Thy will be done in Earth as it is in Heaven', they are praying for a progressive increase in the means of grace within the reach of souls during their service in a Church Militant on Earth that will never be a perfect embodiment of the Kingdom of Heaven—though, in this refractory terrestrial province, it is the Kingdom's lawfully commissioned and effectively serving representative. The Lord's Prayer, prayed with this intention, gives an answer, in the form of a spiritual act, to our perplexing question how, if spiritual progress in Time in

¹ Matt. vi. 33. Cp. Luke xii. 31.

² See pp. 388, 510, and 546-8, above.

This World means progress achieved by individual souls during their brief passages through This World to the Other World, there can be at the same time such a thing in This World as spiritual progress taking place over a Time-span far longer than that of individual lives on Earth—a span running into the thousands of years that had been taken by the historical development of the higher religions from the rise of Tammuz-worship and the generation of Abraham to the Christian Era.

This historical evidence for progress did not necessarily invalidate the Christian view that there was no reason to expect any change in unredeemed Human Nature so long as human life on Earth went on. It was conceivable that, till the face of this planet should cease to be physically habitable by Man, the endowment of individual human beings with natural goodness, and their infection with Original Sin, might remain about the same, on the average, as they had always been so far as human knowledge went. The most primitive societies known to Modern Western anthropologists in the life or by report¹ presented examples both of natural goodness and of innate wickedness that were on a spiritual par with those presented in the histories of the highest mundane civilizations and highest religious societies that had yet come into existence. There had been no perceptible variation in the average sample of Human Nature in the past; there was no warrant in the evidence of History for expecting any great variation in the future either for better or for worse. The likewise Christian hope of a spiritually new species of personality, of which the first-fruits² had already been manifested in Christ and in the Saints, might never receive fulfilment in a regeneration of Mankind in the mass—even in the vastly prolonged possible aeon of life on Earth which was the scientific setting of this Christian hope in the minds of latter-day Western philosophers.³ Yet, even if this hope of a future spiritual mutation of terrestrial Human Nature, which was authorized by Christian doctrine and by a post-Christian Western scientific *Weltanschauung* alike, were never to be realized, the past history of religious revelation would still bear witness that an unregenerate Human Nature was nevertheless a field in which there might be spiritual progress in Time extending over an unlimited number of successive generations of Human Life on Earth; for this history bore witness to the opportunity that, in despite of the spiritual imperfection of Human Nature, was offered to souls, by way of the learning that comes through suffering, for attaining to a closer communion with God, and becoming less unlike Him, during their brief individual transits through this mortal life.

What Christ, with the Prophets before Him and the Saints after Him, had bequeathed to the Christian Church, and what the Church, by virtue of having been fashioned into an incomparably effective institution, had succeeded in accumulating, preserving, communicating, and transmitting to successive generations of Christians, was a growing fund of illumination and of grace: 'illumination' in the sense of a

¹ Pater W. Schmidt's views on the religion of Primitive Man are touched upon on pp. 759–68, below.

² 1 Cor. xv. 20; Col. i. 18.

³ See III. iii. 232–5, and p. 453, above.

'revealed discovery' of the true nature of God and the true end of Man in both This World and the Kingdom of Heaven, and 'grace' in the sense of an 'inspired will' to attain to a closer communion with God in the *dóline* of This World. The founders of the other living higher religions, and the followers of their founders, had made their divers contributions, in diverse measure, to the growing spiritual heritage of Mankind on Earth. In this matter of increasing spiritual opportunity for souls in their passages through this earthly life, there was assuredly an inexhaustible possibility of progress in This World.

If we accept this interpretation of the meaning of 'progress', it raises one last question. Were the spiritual opportunities given by Christianity and the other higher religions indispensable conditions for a soul's 'salvation' through a saving conformation of its personal will to God's will in the course of the soul's passage through Life on Earth?

If the answer to this question were in the affirmative, then the innumerable generations of men who had never had access to the illumination and grace conveyed by Christianity and the other higher religions would have been born and have died without a chance of the salvation which is the true end of Man and the true purpose of Life on Earth. Such a sacrifice of past generations for the sake of Posterity might be conceivable, however repugnant, if we believed that the true purpose of Life on Earth was, not the preparation of souls for another life, but the establishment in This World of an ant-like human society whose improvement was an end in itself without regard to the spiritual, or even material, welfare of 'man-power' whose *raison d'être* was to furnish fodder for Mars' war-machine and fuel for Moloch's furnace. If progress were to be taken as meaning the social progress of Leviathan and not the spiritual progress of individual souls, then it would be, perhaps, conceivable that, for the gain and glory of an inhuman body social, innumerable earlier generations should have been doomed to live a lower life in order that a higher life might subsequently be lived by successors who had entered into their labours in order to be sacrificed in their turn on the altar of an idolized collective human power that, on this view, would be the paramount end to which all human lives were, and ought to be, equally subservient. This nightmare view of human destinies might be conceivable on the hypothesis that individual souls existed for the sake of Society, and not for their own sake or for God's, but such a belief is not only repugnant but is inconceivable as well when we are thinking in terms of the history of Religion, in which the progress of individual souls through This World towards God, and not the progress of Society in This World, is the end in which the supreme value is found. Worshipers of the One True God who believed that He had revealed His power to Man as being a self-sacrificing love could not consistently believe that God's method, unfolded in Man's history, of imparting illumination and grace to men on Earth in successive instalments, beginning at a very recent date in the terrestrial history of the Human Race, and even then vouchsafed only gradually in the course of generations and centuries, could have entailed the consequence that the vast majority of souls born into This World so far,

who had had no share in this spiritual opportunity, had, on that account, been spiritually lost.

If we believe that the true end of Man is 'to glorify God and fully to enjoy Him for ever',¹ we must believe that this glorious opportunity of attaining to communion with God and beholding the Beatific Vision had been open to every creature that had ever been raised by God to the spiritual stature of Humanity. A human being may be defined as a personality with a will of its own capable of making moral choices between good and evil, and it was impossible to believe that Man's Creator, who had manifested His power as Love Incarnate, would ever have endowed any human creature with the capacity to alienate himself from God by willing evil without also placing within his reach means of grace sufficient to enable him to reconcile himself with God by willing 'Thy will be done'. God's provision of effective means of salvation for human souls on Earth did not have to wait for God's progressive self-revelation; for the altar dedicated 'to the Unknown God' which caught Saint Paul's eye at Athens had always been visible in every pagan human heart to the eye of a God whose own merciful providence had placed it there.

'God that made the World and all things therein . . . hath made of one blood all nations of men for to dwell on all the face of the Earth . . . that they should seek the Lord if haply they might feel after Him and find Him—though He be not far from every one of us.'²

The spiritual operation of the grace of an Unknown God on souls ignorantly worshipping Him might be likened to the physical effect of the Gulf Stream on the material life of Man on the Atlantic seaboard of Europe. The genial climate that an ever-flowing Gulf Stream was perpetually bringing with it had made it possible for Primitive Man to work his way along the Atlantic Riviera of the Old World, from Gibraltar to the North Cape, up to latitudes in which, beyond the range of the Gulf Stream's influence, he would have found himself unable to gain any foothold at all; and thereafter, in the medieval phase of Western history, the same still unknown physical benefactor had made it also possible for a life that was not just bare life, but a good life,³ to be lived in the same high latitudes by Man in process of civilization. All these human beneficiaries of the Gulf Stream had lived and died in ignorance of the Gulf Stream's existence, not to speak of its provenance. Yet the denizens of European coastlands that would have been uninhabitable, if they had not been laved by a current making across the Atlantic from the Gulf of Mexico, did not have to wait to benefit from its effect until they had detected its operation and traced it to its source as a consequence of their tardy discovery of the New World. Their ignorance did not impair the effectiveness of the Gulf Stream's operation during the aeons in which they supposed (so far as they thought about their situa-

¹ Answer to Question 1 in the Larger Catechism agreed upon by the Assembly of Divines at Westminster with the Assistance of Commissioners from the Church of Scotland . . . and approved Anno 1648 by the General Assembly of the Church of Scotland.

² Acts xvii. 24 and 26-27.

³ See Aristotle: *Politics*, Book I, chap. 1, § 8.

tion at all) that they were living at the World's End—in their unawareness of the presence, on the farther side of a temporarily estranging sea, of another hemisphere whose unsuspected radiation, through the medium of the intervening Ocean, was the one thing that, all this time, had been making life possible for them in their northerly habitat. If the goodness of God's creatures reflected the goodness of God Himself, believers in God might feel confident that the children of the age-long 'Days of Ignorance' would be mustered in the Communion of Saints, in fellowship with the heirs of a latter-day Promise, at the time when the Kingdom of God would gather all its pilgrim-citizens together¹—a time which is Now in the Eternity of I AM.²

But, if men on Earth had not had to wait for the recent advent of progressively revealed higher religions in order to become eligible, during their lives on Earth, for being received into the Kingdom of Heaven, then what difference had the advent on Earth of the higher religions really made? The difference—and it was a momentous one—surely was that, under the new dispensation, a soul which did make the best of its spiritual opportunities in This Life would be advancing farther towards communion with God and towards likeness to God under the conditions of life on Earth than had been possible for souls that had not been illuminated, during their pilgrimage on Earth, by the light of the higher religions. A pagan soul, no less than a Christian, Buddhist, Muslim, or Hindu soul, would have ultimate salvation within its reach; but a soul which had been offered, and had opened itself to, the illumination and the grace that the higher religions conveyed, would, while still in This World, be more brightly irradiated with the light of the Other World than a pagan soul that had attained salvation, with God's help, through making the best, in This World, of the narrower opportunity here open to it during its earthly pilgrimage. The soul that had lived on Earth under the new dispensation could attain, while still on Earth, a greater measure of Man's greatest good in This Life than could be attained by any pagan soul in this earthly stage of its existence.

This enlargement of the spiritual opportunity offered to souls for spiritual progress in This World during their transits from birth to death had been the aim, the effect, and the test of the historical progress of Religion in This World as manifested in the epiphany of the higher religions. Their pacific conquests might, and almost certainly would, bring with them incidentally an immeasurable improvement in the material, as well as the spiritual, welfare of individual human beings during their lifetimes on Earth; but a spiritual progress in This World was the boon for which Christians were asking when they prayed 'Thy will be done in Earth as it is in Heaven'; and a salvation that was within reach of all men of goodwill—sons of ignorance as well as witting heirs of the Promise—who made the most of their spiritual opportunities on Earth, however narrow these opportunities might be, was the grace for which Christians were asking when they prayed 'Thy Kingdom come'.

In praying this prayer, they were not asking for a millennial mundane

¹ Saint Augustine, quoted on p. 561, above.

² Exod. iii. 14; John viii. 58.

felicity in an earthly paradise that had been more aptly named 'the City of Swine'¹—though it was certain that even a distant approximation to the establishment of the Kingdom of Heaven on Earth would have the incidental effect of ridding terrestrial human life of the ordinary social evils—the scourge of war and the cancer of class-conflict—which, down to the time of writing, had been the bane of Man in Process of Civilization. In praying 'Thy Kingdom come, Thy will be done', Christians were asking, not for social welfare, but for spiritual trouble that would remain unabated even if all current social problems were to be solved.

This truth had been made manifest in an apparent paradox in the lives of the Saints. It was notorious that saints suffered from an acute and painful sense of sin with which *l'homme moyen sensuel* was not afflicted, and that this conviction of their own sinfulness was apt to increase *pari passu* with their spiritual progress. The explanation, of course, was not that the Saints were in fact more sinful than ordinary sinners, and not that the Saints simulated—out of over-scrupulosity, affectation, or hypocrisy—a conviction of sinfulness which they did not genuinely feel. Their judgement on themselves was utterly sincere and was also fully justified; for, high though their spiritual performance might tower above the level attained by the rest of Mankind, their standard of spiritual endeavour dwarfed the ordinary human standard to a far higher degree. The gap between ideal and achievement was, indeed, of a different order of magnitude in the Saints and in other human souls on Earth; for, in catching a glimpse on Earth of the Beatific Vision, the Saints had taken the measure by which the highest flights of terrestrial Human Nature fell short of God's perfection. The Saints' superhuman intuition of their own unworthiness of God was the seal of their sainthood and the inspiration of their spiritual prowess; but it was also the source of a spiritual agony which the unsaintly majority of Mankind could never experience.

The Saints were 'the successors of the Christ of the Gospels, who imitate[d], with an originality of their own, though this only imperfectly, what He [had been] to perfection';² and the agony that was their portion had been suffered, *a fortiori*, by their Master.

'Then came to Him the mother of Zebedee's children with her sons, worshipping Him and desiring a certain thing of Him. And He said unto her: What wilt thou? She saith unto Him: Grant that these my two sons may sit, the one on Thy right hand and the other on the left, in Thy kingdom. But Jesus answered and said: Ye know not what ye ask. Are ye able to drink of the cup that I shall drink of, and to be baptised with the baptism that I am baptised with?'³

If God and Man were united in one person, the tension between the two natures would be so ineffably severe that a crucified man would be the only kind of man that an Incarnate God could be. So great is the

² 'Les continuateurs et les imitateurs originaux, mais incomplets, de ce que fut complètement le Christ des Évangiles' (Henri Bergson, in a saying published in Lou Tseng-tsiang, Dom Pierre Célestin: *Ways of Confucius and of Christ* (London 1948, Burns Oates), p. 115).

³ Matt. xx. 20-22; cp. Mark x. 35-38.

cost of 'the creation of a new species composed of one unique individual'.¹ Creation spells agony because learning through suffering is the only means of spiritual transfiguration.

At this cost, can any human being be made a son of God in the course of his passage through a world which is 'une machine à faire des dieux'?² Perhaps the spiritual achievement manifest in a transfigured soul on Earth 'could not have been attained all at once for the aggregate of Mankind'.³ Certainly the transfigured soul's 'desire is with God's help to complete the creation of the Human Species and to make of Humanity what it would have been from the beginning if it had been capable of constituting itself definitively without the help of Man himself'.⁴ But, since Man cannot become what God wills him to be save by willing God's will with a will of his own, we cannot conceive of Man in This World overcoming sin through a mutation of Human Nature that would render the Soul incapable of sinning; for without a capacity for sin there can be no freedom of moral choice and no possibility of learning through suffering; and a creature that could neither choose between right and wrong nor make spiritual progress through the spiritually perilous exercise of moral responsibility would be less, not more, than human and less capable of becoming godlike than Man was as men knew him in their sinful selves. A proneness to sin—*O felix culpa*⁵—was the spiritual price that Life had paid for becoming human, as mortality was the physical price that it had paid for an organic evolution beyond the limitations of the amoeba. The creation of the Human Species would be completed in a terrestrial Communion of Saints who would be free from sin, not because they would be incapable of it, but because each soul, in its passage through This Life, would be co-operating with God, at the cost of sore spiritual travail, in transfiguring its human nature with the help of God's grace; and, since without God's help this spiritual achievement was beyond the power of Man, the means of grace obtained, accumulated, transmitted, and increased in the spiritual warfare of the Church Militant on Earth was the pearl of great price in Man's social heritage—the earnest of a hope, given to Man by God, that Sin, like Death, might be, not expunged, but conquered.

ANNEXES

VI. A, ANNEX

TABLE OF TYPES OF ENDINGS OF UNIVERSAL STATES

Type I

(Illustrated in the histories of the Yucatec, Arabic Muslim, Hittite, Central American, Chibcha Andean, Hindu, and main Orthodox Christian civilizations)

Act I: The breakdown of the civilization, precipitating a Time of Troubles.

Act II: The successful invasion of the disintegrating civilization by an alien society before the disintegrating civilization has succeeded in stemming its Time of Troubles by establishing an indigenous universal state.

Act III: One or other of two alternative sequels:

A. A direct incorporation of the social tissue of the invaded civilization into the aggressive civilization's body social (the fate suffered by the Yucatec Civilization at the hands of the Mexic,¹ by the Arabic Muslim at the hands of the Iranic Muslim,² and perhaps also by the Hittite at the hands of the external proletariat of the Minoan World as an incidental effect of a post-Minoan Völkerwanderung³).

B. A utilization—unintended on both sides, yet effective nevertheless—of the aggressive alien civilization's act of aggression in order to provide the invaded society with a universal state of alien workmanship in lieu of one made by its own hands (the *tour de force* achieved by the Central American Civilization, which found its universal state in the Spanish Viceroyalty of New Spain;⁴ by the Chibcha province of the Andean World,⁵ which found its universal state in the Spanish

¹ See I. i. 123-4; IV. iv. 105-6; V. v. 42 and 89.

² See I. i. 68-72, 119, 124, and 387-8; II. ii. 77 and 392; and IV. iv. 112-13. The Arabic Civilization had, however, latterly re-emerged from the body of the Iranic Civilization, like Jonah from the belly of the whale (see IV. iv. 113-14 and 115), and seemed to be moving, like the Iranic Civilization from which it had extricated itself, towards incorporation into the body social of the Western Civilization.

³ See I. i. 93 and 114; II. ii. 79; IV. iv. 108-12.

⁴ See I. i. 120; IV. iv. 105-6; V. v. 357 and 525.

⁵ The Chibchas' domain lay within the latter-day frontiers of the Latin American Republic of Colombia (see IV. iv. 103). Like their southern neighbours the Karas in what was to become the domain of the Republic of Ecuador, the Chibchas were, culturally as well as geographically, on the fringe of the Andean World. Though by the time of the Spanish conquest in the sixteenth century of the Christian Era the Chibchas had become masters of the goldsmith's art, and had even established a monetary currency of gold disks (see Joyce, T. A.: *South American Archaeology* (London 1912, Lee Warner), pp. 40-41 and 24), they appear still to have been ignorant of the much more important art of irrigation (see op. cit., p. 39), which was the economic basis of the Andean Civilization in its birthplace in the valley-bottoms along the Peruvian coast (see I. i. 121, 122, 322-3, and 334; II. ii. 34). The Chibchas revealed their cultural inferiority

Viceroyalty of New Granada; by the Hindu Society, which found its universal state first in the Mughal Rāj and then in the British Rāj;¹ and by the main body of the Orthodox Christian Society, which found its universal state in the Ottoman Empire²).

Act IV: One or other of two alternative sequels to Alternative *B* in Act III:

A. A direct incorporation of the submerged society into the body social of the alien society that has provided it with its universal state, through the break-up of this universal state into 'successor-states' that gain admission to the comity of states into which the incorporating society's body politic is articulated. (At the time of writing this seemed³ to be the destiny of the Central American and Chibcha Andean societies since the conversion of the corresponding portions of the former Spanish Empire into the Republics of Mexico and Colombia. At the same date it looked as if the Hindu Society would go the same way, now that, in A.D. 1947, a Hindu universal state, which had found its second avatar in the British Rāj, had broken up into two 'successor-states'—the Indian Union and Pakistan—both of which had shown their desire to be members of a Western comity of states by remaining within the British Commonwealth and joining the United Nations Organization.)

B. A break-up of the alien universal state—producing a perceptible social interregnum occupied by rudiments of the normal creative achievements of the internal and the external proletariat (the triumph of a universal church and a *Völkerwanderung*), but overtaken and overlaid, before these rudiments have had time to develop, by the incorporation of the mortal remains of the defunct universal state into the body

to their contemporaries in the heart of the Andean World by their persistence in the practice of human sacrifice, after this had been almost completely suppressed within the bounds of the Inca Empire (see Joyce, *op. cit.*, pp. 28–29 and 162)—an indigenous Andean universal state under whose rule the Chibchas, unlike the Karas, had not been brought. In the Chibcha province of the Andean Civilization, as in the rest of its domain, this civilization was already in decline by the time when the Spanish *conquistadores* arrived on the scene; but, while in other parts of the Andean World a universal state had already been established by the Incas, the Chibcha province, like the Central American World, was then still in its Time of Troubles. The Spaniards found the peoples of what was to be Colombia, like those of what was to be Mexico, in the throes of a destructive fratricidal warfare among the local states, with the local principality of Bogotá winning its way towards a regional domination such as was all but achieved in Central America by the Aztec principality of Tenochtitlan (see Joyce, *op. cit.*, pp. 13–17). In both cases, the imminent universal state was provided by the alien invaders after they had overthrown the native militarists on the eve of their final triumph.

¹ See II. ii. 77 and 131; IV. iv. 96–98; V. v. 53, 54, and 304–5.

² See II. ii. 77 and 177; III. iii. 27; IV. iv. 2, 68, 76, and 346, n. 2 (on p. 347); V. v. 105 and 107; V. vi. 298–300.

³ This tentative form of expression seemed advisable in this case in view of the recent re-emergence of the Arabic Muslim Society as a separate social entity after no less than three hundred years of incorporation in the body social of the Islamic Muslim Society under the Ottoman régime (see IV. iv. 113–14). Indeed, the revolution that broke out in Mexico in A.D. 1910 and that was still in progress at the time of writing might prove to have marked the beginning of a similar re-emergence of the Central American Civilization from the body social of the Western Society, into which it had been incorporated by force of Spanish arms at about the time when the 'Osmanlis had been successively conquering 'Irāq, Syria, Egypt, the Yaman, and the Barbary States. Moreover, the upheaval that was already taking place in Mexico might prove to be merely the first of a series which might eventually extend into part or the whole of the domain of the Andean Civilization as well (notwithstanding the contrary view expressed in IV. iv. 80–81).

social of another alien civilization. (This seemed at the time of writing to be the destiny of the Orthodox Christian population that had once constituted the Ottoman Millet-i-Rum. The first step taken by all the Orthodox Christian 'successor-states' of the Ottoman Empire had been to organize themselves on the basis of a Modern Western nationalism and to seek admission to the Western comity of states.)¹

Type II

(Illustrated in the histories of the Andean, Babylonian, Syriac, and Indic civilizations, the Western medieval city-state cosmos, and the Far Eastern Civilization in Japan)

Act I: The breakdown of the civilization, precipitating a Time of Troubles.

Act II: The foundation of an indigenous universal state (the Empire of the Incas in Andean history, the Neo-Babylonian Empire in Babylonian history, the Achaemenian Empire in Syriac history, the Mauryan Empire in Indic history, the Napoleonic Empire in the history of the Western medieval city-state cosmos,² the Tokugawa Shogunate in the history of Japan).

Act III: The overthrow of the indigenous universal state, through the successful intrusion of an alien civilization, before the exhaustion of the rally which the foundation of the indigenous universal state has inaugurated (the overthrow of the Inca Empire by Spanish *conquistadores* from Western Christendom; of the Neo-Babylonian Empire by the Achaemenian agents of the Syriac Civilization; of the Achaemenian and Mauryan Empires by Macedonian conquerors from the Hellenic World; of the Napoleonic Empire by the ferment of Modern Western political ideas of which the French empire-builders themselves were the principal disseminators; of the Tokugawa Empire by the impact of a Western Civilization equipped with the armaments of the Industrial Age).

Act IV: One or other of three alternative sequels:

A. A direct absorption of the invaded society into the intrusive alien society's body social (the fate of the Western medieval city-state cosmos, which was reabsorbed into the main body social of the Western Civilization as a result of the Napoleonic Empire's meteoric rise and fall).

B. A utilization of the aggressive alien civilization's act of aggression in order to replace the invaded society's overthrown indigenous universal state with an alien substitute and thereby allow the universal state phase of the history of the invaded society to complete its course. (The universal state phase of Babylonian history, begun under the indigenous

¹ For this ending of the Ottoman Empire, see IV. iv. 76-78 and 188-9; V. v. 294-302 and 520.

² For this historical function of the Napoleonic Empire, see V. v. 619-42.

Neo-Babylonian Empire, was continued under the alien Achaemenian Empire and was completed under the alien Seleucid Monarchy;¹ the universal state phase of Andean history, begun under the indigenous Empire of the Incas, was completed under the alien Spanish Viceroyalty of Peru.²)

C. Persistent and eventually successful efforts on the part of the invaded civilization to expel the intrusive civilization from the whole of its domain (the eventual expulsion of Hellenism from both the Syriac World and the Indic World).³

Act V: Sequels to the alternative courses *B* and *C* in Act IV:

A. The sequel to Act IV, Alternative *B*, appears to be the incorporation of the invaded society into the body social of an intrusive society that has provided it with a continuation of its indigenous universal state. (The inheritance of the mortal remains of the Babylonian Society was contested between the Syriac and the Hellenic Society, and in this contest the Syriac Society was the victor;⁴ the remains of the Andean Society appeared to have been incorporated into the body social of the Western Society since the conversion of the Spanish Viceroyalty of Peru into the Republics of Bolivia, Peru, and Ecuador.⁵)

B. The sequel to Act IV, Alternative *C*, is the reintegration and resumption of the indigenous universal state that has been overthrown before the completion of its course by the irruption of an intrusive alien civilization (the resumption, in the Syriac World, of the Achaemenian Empire in the new shape of the Arab Caliphate;⁶ the resumption, in the Indic World, of the Mauryan Empire in the new shape of the Guptan Empire⁷).

Act VI: The sequel to Act V, Alternative *B*: A break-up, in due course, of the reintegrated indigenous universal state, producing a social interregnum occupied by the normal creative achievements of the internal and external proletariats: the triumph of a universal church and a *Völkerwanderung* (mass-conversions to Islam and inroads of Eurasian, Afrikanian, and Western Christian barbarians at the break-up of the Arab Caliphate;⁸ mass-conversions to Hinduism and inroads of Eurasian barbarians at the break-up of the Guptan Empire⁹).

¹ See V. v. 123 (especially n. 2) and 370.

² See I. i. 120; IV. iv. 79-80 and 103.

³ See I. i. 75-77 and 85-86; II. ii. 285-8 and 371-2; V. v. 125-8; V. vi. 210-11.

⁴ See I. i. 79-81 and V. v. 370.

⁵ See I. i. 119 and V. v. 524-5. At the time of writing this opinion could be no more than tentative, for the reasons given above on p. 570, n. 3. The then still apparently sluggish native peasantry of Bolivia and Peru might prove one day to be charged with the same explosive force that had already erupted from a corresponding social stratum in Mexico.

⁶ See I. i. 76-77. The Achaemenian Empire had an abortive alien heir in the shape of the Seleucid Monarchy, and the Arab Caliphate an abortive indigenous precursor in the shape of the Sasanian Empire.

⁷ See I. i. 85-86. The Mauryan Empire had a succession of abortive alien heirs in the shapes of the Bactrian Greek Empire and the Kushan Empire, and the Guptan Empire an abortive precursor in the Andhra Empire.

⁸ See I. i. 72; V. v. 128 and 242-8.

⁹ See I. i. 85; V. v. 137-8 and 276-9.

Type III

(Illustrated in the histories of the Hellenic, Sinic, Sumeric, and Russian Orthodox Christian civilizations).¹

Act I: The breakdown of the civilization, precipitating a Time of Troubles.

Act II: The foundation of an indigenous universal state (the Roman Empire in Hellenic history, the Ts'in and Han Empire in Sinic history, the Empire of Sumer and Akkad in Sumeric history, the Union of Muscovy and Novgorod in Russian history).

Act III: A collapse of the indigenous universal state as the result of a fresh collapse of the disintegrating society (the collapse of the Roman Empire in the third century of the Christian Era;² the collapse of the Prior Han Dynasty just after the beginning of the Christian Era;³ the downfall of Ur-Engur's (*alias* Ur-Nammu's) dynasty *circa* 2026 or 1962 B.C.;⁴ the bout of anarchy in the early years of the seventeenth century of the Christian Era which is known as 'the Time of Troubles' in the Russian historical tradition⁵).

Act IV: A restoration of the prostrate indigenous universal state by one or other of two alternative means:

A. By self-help (the restoration of the Roman Empire by Illyrian marchmen, of the Han Empire by the Posterior Han Dynasty, of the Empire of Sumer and Akkad by Amorite marchmen).⁶

B. By self-help reinforced by the reception of an alien civilization. (The restoration, by the new dynasty of the Romanovs, of an empire which the House of Rurik had failed to save from collapse, corresponds to the restoration of the Prior Han Empire by the Posterior Han;⁷ the new feature is the subsequent reception of the Western Civilization by Peter the Great in order to enable the restored Russian universal state to hold its own in a Westernizing World.)

Act V: Sequels to the alternative courses *A* and *B* in Act IV:

A. A break-up, in due course, of the restored universal state, producing a social interregnum occupied by the normal creative achievements of the internal and external proletariats: the triumph of a universal church and a *Völkerwanderung* (mass conversions to Christianity and inroads of North European, Eurasian, and Afrasian barbarians at the break-up of the Roman Empire;⁸ mass-conversions to the Mahāyāna and inroads of Eurasian barbarians at the break-up of the Han

¹ It seemed probable, in the light of the information accessible at the time of writing, that the endings of the Minoan and the Mayan universal states likewise conformed to this type, but the evidence was still insufficient to warrant more than a tentative opinion in either case.

² See IV. iv. 8; V. v. 219 and 649-50; V. vi. 207 and 291.

³ See V. vi. 295.

⁴ See V. vi. 297, and the Note on Chronology, x. 171-2 and 212.

⁵ See V. vi. 311.

⁶ For references to previous passages touching on these restorations, see nn. 2, 3, and 4 on this page.

⁷ See V. vi. 311-12.

⁸ See I. i. 41-42 and 62-63; V. v. 80 and 220-2.

Empire;¹ inroads of Eurasian barbarians and Kassites and Hittites at the break-up of the Empire of Sumer and Akkad²).

B. A break-up, in due course, of the restored universal state, producing a perceptible social interregnum, but overtaken and overlaid, before the interregnum has had time to produce its normal phenomena, by a further stage of the progressive incorporation of the dissolving society into the alien society to which it has been deliberately assimilating itself since the restoration of its universal state (the decay and downfall of the Tsardom, after the exhaustion of the tonic of eighteenth-century Western 'enlightened Monarchy', and its prompt replacement by the Union of Soviet Socialist Republics as a vehicle of the nineteenth-century Western social gospel of Marxism).³

Type IV

(Illustrated in the history of the Egyptiac Civilization)

Act I: The breakdown of the civilization, precipitating a Time of Troubles (at some time between the end of the Fourth Egyptiac Dynasty *circa* 2500 B.C. and the fall of the Sixth Dynasty *circa* 2200 B.C.).

Act II: The foundation of an indigenous universal state (the Egyptiac 'Middle Empire').⁴

Act III: A break-up, in due course, of the universal state, producing a social interregnum occupied by the normal creative achievements of the internal and external proletariats: the triumph of a universal church and a Völkerwanderung (mass conversions to the Osirian Church⁵ and the occupation of Lower Egypt by the Hyksos barbarians⁶).

Act IV: A premature termination of the social interregnum, before it has run its normal course, and before the dissolution of the moribund

¹ See I. i. 88; V. v. 140 and 272-4.

² See I. i. 105-6 and 111; V. v. 263-4.

³ The decay of the Tsardom might be dated from the failure of the reforms, carried out in the eighteen-sixties, to bring and keep Russia abreast of the Western World. This failure was brutally but effectively proclaimed in the assassination of the Tsar-Liberator Alexander II in A.D. 1881; and the consequent reversion of the Imperial régime to a policy of repression in the tradition of Tsar Nicholas I was powerless to avert the downfall of the Tsardom in A.D. 1917; but the long impending interregnum had no sooner arrived than it was brought to an end by the establishment of the Soviet régime. In one aspect, this régime unmistakably represented a further step in the process of Westernization. Under the inspiration of a Western 'ideology' the Russian Communists ploughed deep where Peter the Great's hoe had merely scratched the surface of the ground. Peter had been content with Westernizing his professional soldiers and administrators; the Communists set themselves to Westernize the masses by making them literate and training them in a Modern Western industrial technique. At the same time, the policy of the Russian Communists was equivocal. Though Marxism was a Western creed, it was a revolutionary one which, in its Western homelands, was directed against the Western *ancien régime*; and on Russian ground and in Russian hands it might be brought to bear, not merely against the latest phase of the Western Civilization, but against the West as such, in all its manifestations, as the Western Romantic movement had been turned to account, in the nineteenth century, by the Russian Slavophiles (for this ambiguity in the policy and character of Russian Communism, see III. iii. 200-2 and 364-5; V. v. 181-7; and IX. viii. 133-6 and 807-8).

⁴ In the course of the Middle Empire we can descry a slight and transient crisis between the decease of the Twelfth Dynasty and the subsequent series of soldier emperors (see V. vi. 207).

⁵ See I. i. 140-4 and V. v. 149-50.

⁶ See I. i. 105, 106, and 137, and V. v. 266.

society has had time to work itself out, by a sudden fanatical restoration of the indigenous universal state (the Egyptiac 'New Empire').

Act V: The maintenance of the restored universal state—and, with it, of the reanimated civilization—for a term comparable in length to the reanimated civilization's original span of life. (In Egyptiac history, the restored universal state displayed an extraordinary tenacity.¹ When the Eighteenth Dynasty, which had founded 'the New Empire' in the sixteenth century B.C., lost its impetus after a run of more than two hundred years, its task was taken over in the fourteenth century B.C. by a series of soldier emperors² reminiscent of those that, in the history of the original Egyptiac universal state, had taken over the Twelfth Dynasty's task in the eighteenth century B.C. When the régime of the soldier emperors of the Nineteenth and Twentieth Dynasties, after having kept 'the New Empire' in being for another two hundred years, was eventually worn out,³ in its turn, by its own superhuman efforts expended in victoriously stemming, first the Hittite assaults upon the dominions of the Empire in Syria,⁴ and then the avalanche of barbarian invaders that descended upon the northern borders of Egypt itself in the post-Minoan Völkerwanderung,⁵ the ecclesiastical power stepped into the breach laid open by the ultimate collapse of the secular power, and thereby tided the restored Egyptiac universal state over a critical moment in its history.⁶ Some three hundred years later, a persistent, and all but successful, attempt to re-establish the restored Egyptiac universal state, up to the frontiers once attained by it under the Eighteenth Dynasty, was made by the Ethiopian marchmen of the Egyptiac World from Napata;⁷ and, in the long series of successive alien dominations over the northern half of the Egyptiac World, for which the failure of the Napatan adventure in the seventh century B.C. opened the way, it proved impossible for any alien invader to keep his seat for long unless he could bring himself to overcome or dissemble his pride as a conqueror and his contempt for the conquered so far as to be willing to sit on the throne of the Pharaohs in the guise and insignia of a legitimate wearer of the Double Crown.⁸ Thus the simulacrum, at least, of the restored Egyptiac universal state—and, with it, the substance of the Egyptiac culture—was maintained until the conversion of both the inhabitants of the Nile Valley and the Roman Imperial Government to the Syro-Hellenic syncretistic religion of Christianity;

¹ See I. i. 137-9.

² See II. ii. 113.

³ See IV. iv. 422.

⁴ See I. i. 113-14; II. ii. 113; and IV. iv. 110-11.

⁵ See I. i. 93 and 100-1; II. ii. 113; IV. iv. 85 and 422; V. v. 237, 269, 290, and 352; and V. vi. 207.

⁶ See II. ii. 116, n. 1; IV. iv. 421 and 515-17; p. 190, n. 1, above; and p. 692, below.

⁷ See II. ii. 116 and V. v. 268.

⁸ The Ptolemies and their successors the Roman Emperors had the intuition to conceive of this policy and the tact to put it into effect; and at Constantinople in the fifteenth century of the Christian Era, during the last phase of a Palaeologan restoration of an East Roman Empire which had been a restoration of the Roman Empire, the Egyptiac Double Crown was brought out of a lumber room to lend a show of dignity to a shadow emperor's head (see XIII. x. 51-52). The Assyrians made no attempt at conciliation. The Achaemenidae never succeeded in retrieving the effects of Cambyse's personal breach, in his treatment of a conquered Egypt, of the Dynasty's rule of consideration for the traditional institutions of their subjects (see V. v. 704, n. 2, and 705, n. 2).

and this conversion, through which the dissolution of the Egyptiac Society was at last consummated, was separated by a Time-span of more than two thousand years¹ from the date in the sixteenth century B.C. at which an Egyptiac Society, at that time apparently *in extremis*, had been given its surprising new lease of life by the sudden uprising of Amosis against the Hyksos.)

Type V

(Illustrated in the history of the Far Eastern Civilization in China)

Act I: The breakdown of the civilization, precipitating a Time of Troubles.

Act II: The foundation of a universal state by intrusive barbarians with a tincture of alien culture (the imposition of a universal state on the Far Eastern Society in China through the completion of the conquest of the Sung dominions by the Mongols² in A.D. 1280).

Act III: A sudden fanatical replacement of the semi-alien universal state, before it has run its normal course, by an indigenous universal state (the expulsion of the Mongols from China by the Ming³).

Act IV: The maintenance of the universal state—and, with it, of the civilization—beyond the term at which it might have been expected to give place to an interregnum, through the transfer of the universal state from enfeebled indigenous to vigorous barbarian hands instead of its breaking up and being replaced by a bevy of barbarian successor-states (the transfer of rule over an undivided China from the Ming Dynasty to the Manchus in the seventeenth century of the Christian Era).

Act V: The transformation of the unexpired universal state into one of the parochial states of an alien society (the admission of China to the Western comity of states after the Chinese Revolution of A.D. 1911⁴ and the subsequent transfer of her cultural allegiance from the Western Civilization to the Russian⁵).

¹ See I. i. 139.

² For the tincture of Far Eastern Christian culture which the Mongols had acquired before their conquest of China, see II. ii. 237–8; III. iii. 451; V. v. 309 and 348.

³ See II. ii. 121; V. v. 3–4, 54, and 348.

⁴ As was signified in the symbolism of the flag which the Chinese Republic devised for itself, this successor of the Manchu Empire claimed to be the heir of the latter in its capacity of universal state, though at the same time the Revolution of A.D. 1911, in which the Republic came to birth, was an indigenous Chinese uprising against barbarian rule—partly in the tradition of the uprising against the Mongols which had brought the Ming Dynasty into power four and a half centuries earlier, and partly under the inspiration of the alien political creed of Western nationalism.

⁵ Whether the incorporation of the main body of the Far Eastern Society into the body social of a Communist World was to be the last chapter of its history, or whether it might one day extricate itself again and re-enter on a distinct life of its own, was a question that, at the time of writing, seemed likely to remain inscrutable for a long time to come.

VI. B (i), ANNEX

THE ROLE OF THE BYZANTINE ELEMENT IN MUSCOVY'S HERITAGE

WHILE the writer was revising his draft of the chapter to which this Annex attaches, he had the benefit of comments and criticisms from B. H. Sumner, the Warden of All Souls College, Oxford, and from Prince Dmitri Obolensky, the Reader in Russian and Balkan Medieval History in the University of Oxford, on the question of the degree to which the course of Muscovite History was affected by the influence of the Byzantine element in the Russian Orthodox Christian cultural heritage.

B. H. Sumner's opinion on this question is set out in the following passages of a letter of his, dated the 25th January, 1951, to the writer of this Study:

'I find the build-up and development of the Muscovite state in the fifteenth and sixteenth centuries very difficult to analyse, but, from what I have read of those two centuries from the Russian side, I should say that the most effective and practical influences in building up centralized administration and government came from autochthonous Russian developments of the semi-feudal conditions of Moscow and the other Russian principalities (shot through with a strong nationalist colouring), combined with some Tatar influence, but with little Byzantine influence. I do not think, for instance, that either Ivan the Great or Ivan the Terrible regarded themselves as successors of the Byzantine emperors, or that they and their civil servants, *boyars*, diplomats, &c., had any idea of "oecumenical" pretensions. It is true that Ivan the Terrible, for instance, claimed to be Tsar "Autocrat", Gosudar, and appointed by God, combining plenitude of power both *vis-à-vis* his subjects and as against any other states, but he never claimed to be the successor of the *Basileus*, or to be "oecumenical" or "Tsar of the Orthodox Christians of the whole World" (that was the expression used by the Patriarch of Constantinople in a letter to Ivan in A.D. 1561, but not by Ivan). I don't think that it could be held that Ivan the Great and Ivan the Terrible and the civilians in Russia held that there had been any *translatio imperii*, or made any claim over all Christians or all Orthodox.

'Such claims, implicitly or explicitly, had appeared from the end of the fifteenth century onwards, bound up with the idea of Moscow as the Third Rome, but, at any rate at that time, this idea, which admittedly had its origins in writings of certain monks, continued to be confined to certain ecclesiastical circles in Russia, with occasional echoes from Constantinople. It is striking, I think, that the official historiography of the sixteenth century in Russia, which was built up by the Tsars, does not lean at all towards Byzantium: both in the chronicles and in Russian diplomacy of the time the emphasis is all on the heritage of Kiev, not at all on the heritage of Byzantium. That, of course, was because of the continuous struggle for the Russian western lands against Lithuania-Poland.

'From about A.D. 1470 onwards, for more than a century, Moscow had a whole series of overtures, either from Rome or from the Emperor, or

both, linking together an anti-Turkish alliance, re-union of churches, recognition of Moscow as the heir of the Byzantine Empire, and elevation of the Metropolitan of Moscow to the patriarchal dignity. It is, I think, significant that the Russians in reply were always silent as regards the inheritance of the Byzantine Empire, or coronation of the Tsar as "the Christian Tsar". What the Russians were interested in was their claims against Lithuania-Poland and their struggle for an exit to the Baltic, and not the Balkans or the Ottomans: hence the failure of Western overtures for an anti-Turkish alliance and of Western attempts to win the Russians for this by dangling before them the lure of the Byzantine heritage.

Thus, the conception of Moscow as "the Third Rome", or of Muscovy as the inheritor of the "oecumenical" role of Byzantium, was, in my view, of no practical importance and of very little theoretical or emotional importance among the governing class in Muscovy in the late fifteenth, sixteenth, and seventeenth centuries. Its appeal was in the main limited to certain ecclesiastical circles in Muscovy—and, in a sense, to needy Orthodox in the Ottoman Empire in quest of money from Moscow. It is quite true that the idea of Muscovy as the sole possessor of the pure Orthodox Christian faith after the Council of Florence and the capture of Constantinople was a stock-in-trade element in Muscovite national pride during these centuries, and it fostered Muscovite exclusiveness and xenophobia. But this line is not the same as stepping into the shoes of Byzantium by aspiring to an "oecumenical" role.

'Much later, when the Russians had advanced far southwards and were strong enough to challenge the Turks, then the idea of the liberation of the Orthodox, and sometimes that of some form of resurrected Orthodox empire at Constantinople, became prominent, and increasingly so in the nineteenth century. Even so, I think that the influence of the messianic ideas of the Slavophiles and Dostoevsky and their typicalness can be exaggerated, and that the "oecumenical" and messianic elements in Russian nineteenth-century thought ought not to be read back into earlier centuries as being then powerfully creative and proof of a strong and continuous Byzantine heritage.'

In a note communicated to the writer of this Study on the 1st June, 1951, Prince Dmitri Obolensky expresses the same view.

'Neither the successive Russian governments of the sixteenth century nor, on the whole, contemporary Russian writers and historians seem to have taken the theory of "Moscow the Third Rome" very seriously; for the Muscovite rulers from Ivan III onwards, Moscow was much more the "Second Kiev" than the "Third Rome". I would agree here with Humphrey Sumner. Some recent historians have, rightly, it seems to me, "played down" the importance of the theory of "Moscow the Third Rome" in the development of Russian sovereignty. See, for example, G. Olšr: "Gli ultimi Rurikidi e le basi ideologiche della sovranità dello Stato russo", in *Orientalia Christiana Periodica*, vol. xii, Nos. 3-4 (Rome, 1946), pp. 322-73.'

It will be seen that Sumner and Obolensky agree in making three points: In the first place, the concept of 'Moscow the Third Rome' was an academic idea which was never taken very seriously outside ecclesiastical circles; secondly, the architects of a Muscovite autocracy were indebted to the institutions of the East Roman Empire for little except

certain external forms and ceremonies; thirdly, the statesmen in control of Muscovite policy showed themselves unwilling to sacrifice the interests of their own Russian Orthodox Christendom to those of an Ottoman Orthodox Christendom which was sundered from Russia by the double barrier of the Eurasian Steppe and the Black Sea. None of these three points would be contested by the present writer; but he would point out, in his turn, that none of them is incompatible with the thesis that the extinction of the last glimmer of the East Roman Empire in A.D. 1453 had an important and enduring psychological effect on Russian souls,¹ and that this effect consisted in the implantation in them of a feeling that Muscovy, as the now sole surviving Orthodox Christian Power of any consequence, had inherited from the East Roman Empire both the mission of preserving intact the purity of the Orthodox Christian Faith and the high destiny which this onerous mission carried with it *ex officio*.

It will be noticed that Sumner, in the passages quoted above, equates the ideological legacy of the East Roman Empire with a pretension to an oecumenical authority. As the present writer sees it, the idea for which the East Roman Empire had stood, first and foremost, in its own people's minds was the guardianship of Christian Orthodoxy rather than the possession of a title to world-wide dominion. He would, however, go on to contend that, in fact, the second of these two pretensions was logically latent in the first, since it would be difficult for a people to believe that God had singled them out to be the unique heralds of His Truth on Earth without also believing that He had likewise singled them out to be His instruments for propagating this Truth eventually throughout the *Oikoumenê*. It was, for example, an article of orthodox Jewish belief among a politically impotent Jewish diaspora that the extinct Kingdom of David would eventually be restored by the Messiah, not in its historic form as a parochial state, but with a dominion that would be coextensive with the *Oikoumenê*. The writer would therefore take issue with Sumner's contention that the idea of being the sole possessor of the pure Orthodox Faith does not carry with it an aspiration to an oecumenical role; and he would have consulted his friend and mentor further on this point if, by the date when he was revising the present Part of this Study for the press, Humphrey Sumner's friends and fellow historians had not suffered an irreparable loss in this saintly scholar's untimely death.

¹ This psychological effect of the concept of 'the Third Rome' is, however, also questioned by Prince Obolensky:

'I do not wish to minimize the importance of the religious factor in the resistance offered by the seventeenth-century Russian conservatives to the infiltration of Western ideas and customs: some of them at least seem to have regarded Russia as a guardian of the Orthodox faith against the heretical West. But I doubt whether the theory of "Moscow the Third Rome" had much to do with this attitude, except possibly among the "Old Believers". Except in some ecclesiastical, and particularly monastic, circles, this theory does not seem to have made much headway in Russia. . . . [It] does not seem to have been sufficiently accepted to justify the view that future generations of Russians were moved by it to resist the impact of Western culture upon their way of life.'

THE ADMINISTRATIVE GEOGRAPHY OF THE ACHAEMENIAN EMPIRE¹

The Spirit and Policy of the Achaemenian Régime

IN the chapter to which this annex attaches,² we have taken note of the easy-going spirit that was characteristic of the Achaemenian régime.

This *éthos* accounts for the speed and facility with which the Achaemenian Empire was created by Cyrus II and extended by Cambyses II, and for the comparable speed with which it was less easily re-established and farther extended by Darius I. Achaemenian rule was accepted by the stricken peoples of the Syriac and Babylonian worlds because it offered them the 'rest cure' that they needed after their sufferings from the last and worst bout of Assyrian militarism (*saeviebat* 745-609 B.C.),³ from a contemporaneous Eurasian Nomad *Völkerwanderung*, and from the subsequent wars between the fallen Assyrian Power's successor-states; and the widespread *émeute* which broke out in 522 B.C. on receipt of the news of the assassination of the reigning emperor by Darius and his accomplices was an exception that proved the rule of normal acquiescence in the Achaemenian régime. It is true, as we shall see, that the terrible year 522-521 B.C. brought with it a change for the worse in the political *éthos* and structure of the Achaemenian Empire which was never afterwards retrieved. It is also true that, throughout the age of Achaemenian dominion, there were marked differences in the degree of the acquiescence of the divers subject peoples. The Egyptians and the Babylonians—conscious, as they were, of the antiquity of their distinctive cultures and the recentness of their own latest spells of imperial power—persistently felt, and repeatedly acted upon, a hostility towards their Persian masters which was not shared by the Babylonians' former victims the Jews and the Phoenicians.⁴ On the whole, however, the Achaemenian régime met with remarkably little resistance and succeeded in maintaining itself for more than two hundred years at the cost of an impressively slight exertion of force.

This success is largely explained by a policy of *laissez faire* which stood

¹ This amateur essay owes more to Professor Roland G. Kent and Professor George G. Cameron than the writer can easily convey to the reader. It could not have been undertaken at all without the foundation provided by their published work, and the writer might not have had the temerity to print it if these two scholars had not generously spent much time and trouble in reading and commenting on the first draft. While, of course, no responsibility whatsoever attaches to either of them for misstatements of fact and errors of judgement that have still not been eliminated by the writer, with the aid of their comments, in the version here published, the reader would hardly be able to appreciate the magnitude of the writer's debt without seeing with his own eyes the corrections, and better still, the omissions, that were made on the original typescript when it was being revised with these invaluable comments at the writer's elbow.

Before this page was in first proof, the World had lost a great scholar through Professor Kent's death.

⁴ See V. v. 123.

out in welcome contrast to the policies of Assyria and of a Neo-Babylonian Empire that had followed in the Assyrians' footsteps.

Ever since Assyria had won her fight for her existence against the Aramaean invaders of Mesopotamia at the turn of the second and the last millennium B.C.,¹ she had not been content simply to rule the territories which she annexed progressively to her ancestral domain; she had sought to assimilate them as well; and the rigour with which she stamped her impress even on her latest, most ephemeral and most outlying territorial acquisitions is attested by the survival there of the *Assyrium nomen* long after it had been forgotten on the sites of Nineveh, Calah, and Asshur itself.² Though the Assyrian records known to Western scholars in the twentieth century of the Christian Era did not bear witness to any extension of a short-lived Assyrian hegemony in South-Eastern Anatolia any farther north-westward than the principality of Khilakku (*Graecè* Kilikia, *Latine* Cilicia) astride the southernmost bend of the River Halys, the Assyrian name must have been associated with the 'White Syrian' inhabitants of the north coast of Anatolia, round the mouths of the rivers Halys, Iris, and Thermodon,³ at the time when, in the course of the seventh century B.C., the Hellenic explorers and colonizers of this coast had pushed that far eastwards.⁴ In this quarter, it is true, the Assyrian name did not survive for long; but in Western parlance in A.D. 1952 it was still current in 'Syria', where the Persians and the Hellenes had successively taken over from the Neo-Babylonian régime the name 'Assyria' to denote a country which had always been vehemently recalcitrant to Assyrian rule, and whose coastline was occupied by peoples bearing the famous names 'Phoenicians' and 'Philistines'.

In Syria, at any rate (though not, as far as was known, in Pontic Cappadocia), one of the means by which the Assyrians had thus succeeded in stamping their name on countries and peoples that execrated their domination and abhorred their culture had been a systematic obliteration of previous political landmarks and substitution of an arbitrarily mapped out network of Assyrian provinces; and, at the opening of the last paroxysm of the *terror Assyriacus*, this administrative engine of 'Assyrianization' had been keyed up by Tiglath-Pileser III (*accessit* 746 B.C.). The twenty-four provinces into which the Assyrian Empire had been articulated within its frontiers as these had stood at Tiglath-Pileser's accession had been redistributed, by 745 B.C., into twice as many departments,⁵ and thereafter additional departments on the new scale had been created *pari passu* with the further expansion of Assyrian rule south-westward into Syria, eastward on to the western rim of the Iranian Plateau, and south-eastward into Babylonia. In instituting and extending this new close-meshed system of local administration, Tiglath-Pileser III and his successors were pursuing the same aim as the post-Revolutionary French conquerors of Northern

Italy, the Low Countries, the Rhineland, and North-Western Germany. The Assyrian Empire, like the Napoleonic Empire, was attempting permanently to assimilate and absorb the annexed territories into its own *body politic*.

This Assyrian policy of assimilation was the background and foil against which an antithetical policy was inaugurated by the Achaemenidae. Cyrus II and his successors sought to reconcile their subjects to their rule by keeping down to a minimum the Achaemenian Imperial Government's interference with existing habits and customs; and, on the plane of administrative geography, this policy took the forms of permitting a maximum amount of local self-government and refraining from more than a minimum amount of change in those *ci-devant* frontiers between sovereign states that had now become boundaries between Achaemenian viceroyalties ('satrapies').¹ So long as their subjects kept the peace and paid their taxes, the Achaemenidae were content to leave them to live as they pleased in other respects; and they were slow to anger, even when they had to deal with inveterate rebels. Herodotus was rightly much impressed by their generosity in reinstating the sons of both the two insurgent Egyptian client princes Inarôs and Amyrtæus on the thrones that their fathers had forfeited—'regardless of the fact that no one had given more trouble than Inarôs and Amyrtæus had to the Persian Imperial Government.'²

This Achaemenian policy of *laissez faire* was, however, to some extent frustrated by the recalcitrance of certain of the beneficiaries. While the unwaveringly loyal Phoenician city-states along the coast of Syria were rewarded by being invested with miniature empires—*imperia Punica in imperio Persico*—astride one of the vital lines of Achaemenian communications,³ the persistently refractory Hellenic city-states along the west coast of Anatolia had to be held through the agency of local despots, acting in the Achaemenian interest, whom their subjects regarded as 'quislings'; and a corresponding discrimination was forced upon the Achaemenian Imperial Government in their policy towards the viceroyalties that were the largest units of regional administration within this universal state. The Neo-Babylonian Empire, which Cyrus had swallowed whole, was subsequently broken up into two taxation districts⁴—one consisting of Babylonia itself and the other of the ex-Assyrian territory that had fallen to the Neo-Babylonian Empire's share when Nabopolassar had partitioned the Assyrian dominions with his Median ally; and Herodotus's gazetteer of Darius I's taxation districts—muddled though it is here and there—brings some skeletons out of an Imperial cupboard which the draftsmen of the official inscriptions had been careful to leave unopened. Herodotus's information makes it evident, as we shall see, that three of the original viceroyalties—an Armenia that had perhaps been taken into partnership by the founder of the Median Empire, a Media that had undoubtedly been taken into

¹ The Old Persian word 'khšathrapāvan' (*Graecé* 'satrapēs') signified 'protector of the kingdom' (Kent, *Old Persian: Grammar, Texts, Lexicon* (New Haven, Conn. 1950, American Oriental Society), p. 181).

² Herodotus, Book III, chap. 15.

³ See V. v. 123, n. 2.

⁴ See further pp. 657-8, below.

partnership by the founder of the Achaemenian Empire, and a Persia that had become, and still remained, the reigning imperial country—had each been partitioned in Darius I's new division of the Empire into taxation districts; and we may guess that this dissection of these great political units into a larger number of smaller fiscal units had been carried out as a precaution against any repetition of the all but lethal stabs which the usurping scion of the Ariaramnan branch of the Achaemenidae had received from Armenians, Medes, and Persians alike in the anarchic first year of his reign. On the evidence supplied by Herodotus, we can see that, for fiscal purposes, Media had been partitioned into four divisions;¹ Armenia into three;² and Persia into two.³ Conversely, Herodotus reveals that one loyal viceroyalty had been given a territorial reward—though one of dubious value. The rebellious Medes who had been deported to islands in the Persian Gulf and three rebellious Persian tribes, the Yautiyā (*Graecè* Outioi) and the Mačiyā (*Graecè* Mykoi) in Lāristān and the Asagartiyā (Sagartioi) in Kirmān, who had been degraded to the status of subject peoples burdened with a penally heavy tribute, had all been attached to the loyal viceroyalty of Harahvatiš (written Harauvatiš: *Latine* 'Arachosia').⁴ The official lists indicate that the Viceroyalty of Harahvatiš had been further enlarged by the transfer of Zrāka from the Viceroyalty of Parthava, and that the loyal viceroyalty of Bākhtriš (*Latine* Bactria or Bactriana) had been rewarded by being allowed to retain a sub-empire which included not only the administration of Suguda or Sugda (*Latine* Sogdiana), north-east of the Oxus, but a supervision over the Achaemenian Empire's independent allies the Sakā Haumavargā (*Graecè* Sakai Amyrgioi), north-east of the Jaxartes, in Farghānah.⁵

The grounds for these inferences from the information furnished by Herodotus are discussed below, and the conclusions are mentioned, by anticipation, at this point simply to illustrate the historical fact that in certain cases the Achaemenian Imperial Government found itself compelled by *force majeure* to depart from its standing policy of respecting the traditional boundaries between viceroyalties. In the course of the Achaemenian Empire's history, both the areas and the number of the viceroyalties are known to have varied. They might be—and perhaps usually were⁶—larger than taxation districts, or they might be smaller, as was, for example, the viceroyalty of Karkā (*Latine* Caria) that was separated from Yauna (*Latine* Ionia) eventually—perhaps after the suppression of the Ionian Revolt of 499–491 B.C.—if we may draw this inference from the absence of the name Karkā in the three earliest, and its presence in the three latest, of the official lists of countries under Achaemenian sovereignty or suzerainty. On the other hand it is to be

³ See further pp. 620–3 and 637–41, below.

⁴ See further pp. 602–3 and 637–41, below.

⁵ See further pp. 644–8, below.

⁶ See Junge, P. J.: 'Satrapie und Natio: Reichsverwaltung und Reichspolitik im Staate Dareios' I' (*Klio*, vol. xxxiv (Neue Folge, vol. xvi, Heft 1/2) (Leipzig 1942, Dieterich), pp. 1–55, especially p. 5, n. 5).

presumed that the boundaries of the taxation districts remained relatively constant throughout,¹ since any variation of these would inevitably have thrown into confusion the records, kept in the Imperial Ministry of Finance, which were the key to an effective maintenance of the Imperial taxation system. In the administrative geography of the Achaemenian Empire the two sets of permanent units must have been these taxation districts and the communes, exercising local self-government, out of which each taxation district was built up.

In his gazetteer of the Achaemenian taxation districts,² Herodotus makes it clear that, in his belief, these had been instituted by Darius I at the beginning of his reign,³ at a date at which he had not yet overstepped the north-west frontier along the coastline of the mainland of Anatolia which he had inherited from his predecessors. Herodotus believed that, within these limits (which included Darius's own conquests in the Indus Basin), the Achaemenian Empire had originally been dissected by Darius into twenty taxation districts, and that two more—'the Isles' and 'the Peoples of Europe as far as Thessaly'—had subsequently been added before the recession of the North-West Frontier as a result of the disastrous outcome of the campaigns of 480–479 B.C. Herodotus was aware that the Achaemenian Empire also embraced one partially tax-paying non-subject principality, Cilicia, which he has included in his list of the twenty taxation districts as his Number 4, and some tax-free countries besides. The chief of these was Pārsa (*Græcè* Persis)⁴—or, more accurately, the remnant of Pārsa whose denizens had retained the privileged status of being the imperial people after the civil war between Persian and Persian in the South-East during the terrible year 522–521 B.C. The other three non-tax-paying peoples known to Herodotus were, all of them, transfrontier allies: the Ethiopians marching with the southern frontier of the Viceroyalty of Egypt; the Arabs whose autonomous territory included a short strip of coast at the south-east corner of the Mediterranean,⁵ and 'the Colchians and adjoining peoples, as far as the Caucasus Range', on the north.⁶

This distinction in status between the imperial people, its allies, and its subjects may perhaps have counted for something on the political plane. Cilicia, for example, is not included in any official Achaemenian list of the peoples of the Empire, and Pārsa is tactfully omitted from the list of tax-paying subject countries in Darius's inscription 'Persepolis *e*' and is still more tactfully differentiated from them in his 'Susa *e*' and in his 'Naqš-i-Rustam *a*'. But on the fiscal plane in any case it looks as

¹ On this see Junge: 'Satrapie' (*ibid.*, pp. 4–5); eundem: 'Hazarapatiš' (*ibid.*, vol. xxxiii (Neue Folge, vol. xv) (Leipzig 1940, Dieterich), pp. 30–38, especially p. 32, n. 1).

² Herodotus, Book III, chaps. 89–97.

³ The text of the Behistan Inscription was not one of the Achaemenian official documents that had come into Herodotus's hands (though a copy of it was in the archives of so remote a community as the Jewish military colony at Elephantine on the southern frontier of the Viceroyalty of Egypt); and Herodotus was not aware of the year of anarchy between Darius's assumption of the Imperial Crown and his effective assertion of his authority throughout the Achaemenian dominions.

⁴ See Herodotus, Book III, chap. 97.

⁵ See *ibid.*, chaps. 4–9.

⁶ These peoples are all entered in the list of non-tax-paying peoples in Book III, chap. 97; but in Book III, chap. 88, the Arabs are declared to be the only free allies of the Empire. Herodotus was unaware of the status of the Amyrgian Sakas.

if the distinction were little more than a formality, considering that the 'free' peoples, including the Persians themselves, were constrained to bring the Emperor annual gifts that were no more voluntary than the 'benevolences' exacted by King Henry VII of England, while on the other side the avowedly tax-paying subjects appear (to judge by the official bas-reliefs) to have paid their taxes, including those discharged in the precious metals, in kind (i.e. in the form of gold and silver vases) and not in coin. Moreover, all parts of the *Oikoumenê* that lay within economic range of the Achaemenian Imperial Government, including distant regions that were completely independent of it politically, were affected economically by the annual non-return journey of appreciable quantities of the precious metals to the Imperial treasuries at Susa, Ecbatana, and Persepolis. This one-way flow persisted for some two centuries, until the accumulated hoards were suddenly thrown into circulation again by Alexander.

The Extant Sources of Information

The information about the administrative geography of the Achaemenian Empire that was accessible to Western scholars in A.D. 1952 was all derived ultimately from Achaemenian official sources; but it had come through two separate channels: official documents inscribed by the Achaemenian Government itself and facts and figures, doubtless originally emanating from Achaemenian official documents, which had been obtained, and incorporated into his own work, by the Hellenic historian Herodotus. Either of these two sets of statements could be used as a check upon the other; and this was fortunate, since neither authority was satisfactory in and by itself. Herodotus—or the intermediaries through whose hands his information had reached him—had obviously misunderstood, wrongly presented or erroneously emended some of the official material on which the Herodotean account of Achaemenian administrative geography was based; yet, in virtue of being a private person who had ceased to be an Achaemenian subject and who had no official axe to grind, Herodotus had conveyed to his readers information which the Achaemenian Government had taken care not to impart in its official inscriptions. Conversely, these official inscriptions, while they certainly did not tell the whole truth that the Herodotean picture revealed, were presumably free, so far as they went, from the misunderstandings and errors into which Herodotus had fallen.

In Table V, folding out opposite page 772, the names of countries and peoples given in the six official lists are set out on the left-hand side¹ and the corresponding names given by Herodotus on the right-hand side. The interpretation of the information, coming from these divers sources, which has determined the arrangement of the names in this table is explained and discussed in the remainder of the present Annex.

¹ In handling the names given in the six official lists, the present writer has taken for his guides two papers by experts: R. G. Kent's 'Old Persian Texts, IV: The Lists of Provinces', in the *Journal of Near Eastern Studies*, vol. ii, January–October 1943 (Chicago 1943, University of Chicago Press), pp. 302–7, and G. G. Cameron's 'Darius, Egypt and "the Lands beyond the Sea"', *ibid.*, pp. 307–13. Without these guides, he would have been incapable of embarking on his own present amateur essay.

The official information that had come into Modern Western hands direct consisted of six lists—five inscribed by Darius I and one by Xerxes—of *dahyāva* (countries represented on the throne-bearer reliefs by male figures displaying the characteristic physique, style of hair-dressing, and costume of their respective peoples) over which Darius I and Xerxes claimed to be bearing rule. The documentary monuments in which these lists occurred were Darius I's record of the events of the first year of his reign on the cliff at Behistan, overlooking the Great North-East Road from Babylon via Ecbatana and the Caspian Gates to the Oxus-Jaxartes Basin ('DB'); Darius's inscription *e* at Persepolis ('DPe'); Darius's inscription on the stelae that he erected in Egypt along the ship canal that he dug to connect the Indian Ocean with the Mediterranean from Suez via the Wady Tumilat and the Nile ('DZd'); Darius's inscription *e* at Susa ('DSe'); Darius's inscription on his tomb cut into the cliff at Naqš-i-Rustam ('DNa');¹ and Xerxes' inscription *h* at Persepolis ('XPh'). Of these six lists, 'DB', 'DSe', 'DNa', and 'XPh' were inscribed in three languages: Old Persian, Elamite, and Babylonian; 'DPe' was inscribed in Old Persian only; the inscription on the stelae at Suez was in Egyptian hieroglyphic characters, into which it had been transcribed from Aramaic. Inscription 'DNa' was accompanied by a bas-relief—to which the inscription called the reader's attention—in which the thirty peoples, including the Pārsā, whose names were recited in the list, were delineated, as throne-bearers, in the order of their mention in the list and with their names attached to them;² and this set of figures was repeated at Persepolis in a tripylon dating from the end of Darius I's reign and again in 'the Hall of the Hundred Columns' dating from the end of Xerxes' reign.³

The six lists contain between them thirty-two names, including Pārsa. Twenty-one of the thirty-one names other than Pārsa occur in all six lists (though not in the same order in each list) namely (to cite them in the order of the earliest document, 'DB'): Hūja (written Ūvja), Bābiruš, Athurā, Arabāya, Mudrāya, Sparda, Yauna, Māda, Armina (*alias* Arminiya), Katpatuka, Parthava, Zrāka, Haraiva, Hvārazmīy or Hvārazmiš (written Uvārazmīy or Uvārazmiš), Bākhtriš, Suguda (*alias* Sugda), Gādāra, Saka, Thataguš, Harahvatiš (written Haraувatiš), Maka. Four lists out of the six—i.e. all except 'DB' and 'DPe'—divide one of these twenty-one common units, namely the Sakā, into two groups. 'The

¹ There were four rock-tombs, in all, at Naqš-i-Rustam (see Kent, *Old Persian*, p. 109).

² 'The inscriptions identifying the throne-bearers on DN are mostly illegible; most of those on the other tomb at Naqš-i-Rustam displaying throne-bearers, which may be the tomb of Artaxerxes II or III, are still decipherable.'—Professor Roland G. Kent.

³ See Junge, P. J.: 'Satrapie und Natio', p. 22. According to Junge, *ibid.*, p. 24, this set of figures of throne-bearers was not identical with the set of figures of tax-payers, supplemented by a set of figures of present-bringers, representing the Persian nobility of Hūja (where there was a Persian population in the districts of Parsuwaš, *alias* Parsawaš, and Anšan) and Pārsa and the Median nobility, of which a complete specimen had been preserved in a relief in Darius's apadāna dating from the last years of Darius's reign. According to the same authority (p. 25), the set of figures representing the tax-payers omitted the Sakā Haumavargā, the Hvārazmiš, 'the Sakā beyond the Sea' (i.e. the Scyths in the Great Western Bay of the Eurasian Steppe), the Dahā and the Thata-gu[?d or v]jiyā.

Hauma-(?)drinking Sakā' (Sakā Haumavargā)¹ are distinguished from 'the Pointed-Hood Sakā'² (Sakā Tigrakhaudā) in 'DSe', 'DNa', and 'XPh', and 'the Sakā of the Marshes' from 'the Sakā of the Plains' in Darius I's Egyptian list 'DZd'.³ Gādāra and 'those in the Sea', both mentioned in all the other five lists, are omitted from 'DZd', whether by inadvertence or through lack of space.⁴ Hiduš, which had evidently not yet been annexed at the date at which 'DB' was inscribed, appears in all five subsequent lists. 'Those beyond the Sea' (i.e. the peoples of Thrace, perhaps also including some of the Nomad Scyths on the north bank of the Lower Danube) are not mentioned in either 'DB' or 'DE', but appear in all four subsequent lists. 'DSe', 'DNa', and 'XPh' all also add Skudra, Putāyā, Kūša, and Karkā.⁵ 'XPh' alone adds the Dahā and the Ākau-fāciyā as well, but none of these three latest lists includes Asagarta,⁶ which is named in 'DPe' only.⁷

¹ 'The hauma-, of course, is identical etymologically with Sanskrit soma-, and the *Avesta* and the *Rigveda* agree as to its use. In the *Avesta* it is the name of a plant, which may have been of the milkweed type, and of the juice which was pressed out from it, the juice then being allowed to ferment and develop intoxicating properties, after which it was used as a drink by the priests—or perhaps by other persons also. There is no identified Indo-European root from which varga can come. The resemblance to Greek *pergon* is unfortunately misleading, since that goes back to a **verg-* with a palatal *g* that gives Iranian *z*, as in Avestan *varəz*, and O.P. *d*, as in *Arta-ward-ia*. The **verg-* in *haumavarga-* must have had a velar or labiovelar *g* at an earlier stage. The *hauma* being a liquid, this *varga-* may mean "pressing out" or "preparing" or "using" or "consuming"—the last word covering "eating and drinking".

'If Greek Aspourgianoī (your p. 644, n. 5) represents Iranian *aspa-vargā*, the latter need not mean "horse-eaters", but might be *kumiz-drinkers*, i.e. drinkers of fermented mare's-milk. Then we could re-establish "hauma-drinking" for *haumavargā*.'—Note by Professor Roland G. Kent.

'Pressing out', which is one of the alternative possible meanings of *varga-* that are suggested above by Professor Kent, might perhaps be used both for milking a mare and for squeezing the juice out of a plant. If this is its meaning, '*aspavargā*' would be an Iranian equivalent of the Homeric Greek *ἰππόμελοι*.—A.J.T.

² The shape of 'the Pointed-Hood Sakā's' distinctive headgear was known from the portrayal of their prince, Skunkha, on Darius's Behistan relief. The twentieth-century English word that would most naturally have been used to describe it was not 'hood' but 'cap'. The word 'hood' has been applied to it in this Study because there seemed to the writer to be indications that the Medieval and Modern Western hood was ultimately derived from the Sakā Tigrakhaudā's head-dress (see XIII. ix. 53–55). The writer did not possess the philological knowledge to be able to judge whether Skunkha's 'khauda' was to be identified with a Western scholar's hood etymologically as well as genetically, or whether this Old Persian word was represented by the New Persian 'khūd', meaning helmet by itself and cock's-comb in the compound 'khūd khurūs'.

³ Though, on the face of it, it seems unlikely that the same Achaemenian emperor Darius should divide the same people into two groups on different lines in different official inscriptions, it cannot be demonstrated that these two formulas for dividing the Sakā into two are equivalent to one another.

⁴ Lack of space is A. T. Olmstead's explanation in his *History of the Persian Empire* (Chicago 1948, University of Chicago Press), p. 149.

⁵ The plural of the *ethnikon*, standing for the name of the country.

⁶ Asagarta is mentioned four times, and the *ethnikon* Asagartiya twice, in the text of 'DB'.—Professor Roland G. Kent.

⁷ These discrepancies between the contents of the divers official lists enable us to arrange them in the chronological order of their successive redaction with one exception: we are left in doubt about the chronological relation between 'DPe' and 'DZd'. Both these lists are evidently later than 'DB' (on the assumption that the reason why Gādāra and 'those in the Sea', which appear in 'DB', are omitted in 'DZd' is simply lack of space or inadvertence, and not because these two peoples were not yet included in the Achaemenian Empire at the time when 'DZd' was composed). 'DPe' and 'DZd' are also both evidently earlier than 'DSe', 'DNa', and 'XPh'. The chronological relation between 'DZd' and 'DPe' themselves is, however, impossible similarly to establish from the internal evidence, because different items point to opposite conclusions. From the absence in 'DZd' of 'those beyond the Sea', who appear in 'DPe', as they do in all

It is not easy to make out on what principle, if any, the names included in these official lists have been selected. It is clear that they are only a selection from a larger list, since the names of several other countries—e.g. Marguš, Varkāna, the Yautiyā—are mentioned incidentally by Darius in his record of the events of the year 522–521 B.C. in associations which show that Marguš was embraced in the Viceroyalty of Bākhtriš and Varkāna in the Viceroyalty of Parthava, and that the Yautiyā were Persians. In the lists, however, Varkāna is never named, though Haraiva, which would appear to have had the same status as Varkāna within the Viceroyalty and Taxation District Parthava, is named in the lists invariably; and similarly Marguš is never named in the lists, though they invariably name Suguda, which, like Marguš, was a canton within the Viceroyalty and Taxation District Bākhtriš. Moreover, the peoples mentioned in Herodotus's gazetteer of the taxation districts, either by name or as the anonymous neighbours of other peoples who are mentioned by name, amount to seventy-three in all, according to the reckoning adopted in this Annex; and we have to conclude that Herodotus or his intermediary obtained from official Achaemenian sources about twice as many names as are mentioned in the Achaemenian official lists—even when we have allowed for Herodotus's several times repeated error of inserting the same people twice or three times over under different names which he had failed to recognize as being synonymous, and when we have also recognized the possibility that, in naming peoples included in taxation districts with seaboard on the Mediterranean, the Aegean, and the Black Sea, the Herodotean list may have supplemented its official source by adding other names that were household words in Hellas.¹

The omission of the name of Cilicia in all six official lists, and the special treatment of Pārsa in three of them,² are features that would suggest in themselves that these lists were intended to be representative of the tax-paying subject population—each name standing either for a single taxation district or for a single viceroyalty³—but this explanation is ruled out by the inclusion of Arabāya, the Kūšiyā, the Ākaufačiyā, and the Sakā Haumavargā, since the Arabs, the African Ethiopians, and

the three latest lists, we might infer that 'DZd' was earlier than 'DPe', if the opposite conclusion were not just as strongly commended by the absence in 'DPe' of the Putāyā and the Kūšiyā, who appear in 'DZd' as they do in all the three latest lists likewise. Two further points of difference both also tell in favour of dating 'DPe' earlier than 'DZd'. 'DPe' mentions the Sakā without distinguishing between two varieties of them, whereas 'DZd' distinguishes two varieties—though we cannot be sure that its distinction between 'the Sakā of the Marshes' and 'the Sakā of the Plains' is identical with the distinction, made in the three latest lists, between 'Sakā Tigrakhaudā' and 'Sakā Haumavargā'. Moreover, the order of the names in 'DPe' indicates that Zrāka is still included in the Viceroyalty of Parthava, whereas the order in 'DZd' indicates that Zrāka has already been detached from Parthava and attached to Harahvatīš.

On this showing, 'DZd' has tentatively been placed after 'DPe' in the Table.

¹ On the other hand, such names as the Outioi in Herodotus's Taxation District No. 14, and the Dadikai and Aparytai in his No. 7, can have reached him only from Achaemenian official sources, though they do not appear in any of the official lists.

² See p. 584' above.

³ Professor G. G. Cameron comments: 'The omission of Cilicia and special treatment of Pārsa indicate to me not a list of tax-paying subjects but simply a list of areas where there was a satrap'. But will not the imperial territory administered by satraps have been co-extensive with the imperial territory inhabited by tax-paying subjects, even though, within this total domain, the respective areas of particular satrapies and particular taxation districts did not coincide?

the Colchians are known from Herodotus, and the Sakā Haumavargā are known from other Hellenic sources,¹ to have been, not tax-paying subjects, but 'gift-bringing' allies. Moreover, while the number of the taxation districts seems unlikely ever to have risen from an original figure of twenty to as many as thirty-two, and the number of the viceroyalties, at its highest, will have fallen short of thirty-two *a fortiori*,² the four taxation districts into which Media had been partitioned on the testimony of Herodotus are all embraced, in all the official lists, under the single name 'Māda', while on the other hand the three components of the single viceroyalty of Bactria—namely the two subject peoples Bākhtriš and Suguda and the allied people known as the Sakā Haumavargā who were brigaded with them—are separately mentioned in all the official lists, each under its own name. The generally accepted view that Suguda was an integral part of the Viceroyalty of Bākhtriš rests on the fact that it is placed immediately after Bākhtriš in all six lists; and the same reasoning suggests that Haraiva was always included in the Viceroyalty of Parthava and that Zrāka was originally also attached to Parthava and was subsequently transferred, at least for a time, to the Viceroyalty of Harahvatiš.³

It is thus evident that the selection of names in the official lists is not the roll-call either of the viceroyalties or of the taxation districts or of either of these two sets of administrative units together with the 'externally associated' allies. At least nine names⁴ out of a total of thirty-two that appear on one or other of the lists are those of countries which never, so far as we know, constituted either separate viceroyalties or even separate taxation districts; and there are at least two taxation districts in the Herodotean gazetteer—Nos. 17 and 19—which are not represented by any of the names in the official lists. None of this, however, is surprising, since we may feel sure that the purpose for which this selection of names was made by Achaemenian officials was not that of enabling twentieth-century Western scholars to reconstruct the Ariaramnan Achaemenian Empire's administrative geography. It is indeed manifest that the positive purpose of the lists, like that of the accompanying visual representations of throne-bearers, is to give the reader and spectator an impression of the Imperial Dynasty's and Imperial People's achievement in conquering and holding an empire of so vast an extent and so variegated a racial and cultural composition. This intention is indicated in 'DB' in the observations in §§ 7–9, which immediately follow the recital of the list and which are recapitulated more briefly in 'DNa', § 4, in the same context. The latter passage continues as follows:

'If you say to yourself: "How manifold were those lands that King Darius possessed", look at the representations of the throne-bearers, and then you will recognise—then verily you will know—that a Persian fight-

¹ See further pp. 644–5, below.

² See further pp. 683–4, below.

³ In both 'DB' and 'DPe' the three names Parthava-Zrāka-Haraiva appear consecutively in this order, and Haraiva is placed immediately after Parthava in 'DSe', 'DNa', and 'XPh', while in 'DZd', conversely, Haraiva is placed immediately before Parthava. On the other hand, Zrāka is placed immediately after Harahvatiš in 'DZd', and immediately before Harahvatiš in 'DSe' and 'DNa'. In 'XPh', Zrāka-Parthava-Haraiva are cited consecutively again in this order.

⁴ Zrāka, Asagarta, Maka, Dahā, Hvārazmiš, Haraiva, Suguda, Thataguš, Putāyā.

ing-man's spear has pressed forward far—then verily you will know that a Persian fighting-man has given battle far from Pārsa.'

In short, the intention of the lists is to convey the fact that is more succinctly expressed in a boast inscribed on the foundation tablets of the apadāna at Persepolis and is reproduced in identical terms in an inscription found *in situ* at Ecbatana: the Achaemenian Empire extends 'from the Sakā who are beyond Suguda to the Kūšiyā, and from Hīduš to Sparda'.¹

At the same time the circumspect compilers of the official lists did not allow their enthusiasm for advertising the extent and variety of the Achaemenian Empire to lead them into mentioning names that might have drawn attention to other facts which would have betrayed a damaging truth. The Ariaramnan branch of the dynasty that proudly reigned over this far-flung empire had learnt by the bitter experience of their anarchic inaugural year 522-521 B.C. that they could not depend on the loyalty of more than a minority even of the two imperial peoples, the Pārsā and the Mādā; and they had accordingly taken the precautions of partitioning them both for fiscal purposes, of degrading dissident Pārsā to the status of tax-paying subjects, and of deporting dissident Mādā to islands in the Persian Gulf. But, the more necessary these political precautions were held to be, the more inexpedient it would have been to draw attention to them; and the very frankness of the account in 'DB' of the rebellion of the Yautiyā Pārsā explains why this name of ill omen does not appear on any of the six official lists, though it is tactlessly included, in the Hellenized form 'Outioi', in Herodotus's recital of the peoples brigaded, in his taxation District No. 14, with the Harahvatiyā (disguised in the terminology of Herodotus's source as 'the Thamanaioi', signifying 'the borderers'). As for the no less tell-tale name 'Asagarta',² the imprudent mention of it in 'DPe' is never afterwards repeated. The official lists do, in fact, skilfully achieve the dual purpose of advertising the grandeur of the Ariaramnan Achaemenian Empire without exposing its seamy side to public view. But, of course, the more successful these lists are in achieving the combination of purposes which they were designed to reconcile, the harder they make it for the historian to wring out of them the truth for which he is seeking.

The information—drawn, at least in part, from Achaemenian official sources, though perhaps only at second or third hand—that has been incorporated by Herodotus into his history, is presented by him in what profess to be three official documents: a gazetteer of Darius's original twenty taxation districts;³ an itinerary of the Achaemenian Empire's Great North-West Road,⁴ associated by Herodotus with a map of the

¹ See Junge: 'Satrapie und Natio', pp. 15-16; Cameron, G. G.: 'Darius, Egypt and "the Lands beyond the Sea"', in *The Journal of Near Eastern Studies*, vol. ii, January-October 1943 (Chicago 1943, University of Chicago Press), pp. 307-13. The present reference is to p. 312, n. 31.

² Its historical associations were known to twentieth-century scholars, thanks to six mentions of it (four times in the place-name form and twice in the ethnic form) in Darius's narrative, in 'DB', of the events of the year 522-521 B.C.—a narrative that was as frank as the official lists of *dahyāva* were discreet.

³ Herodotus, Book III, chaps. 89-96 (see p. 178, above).

⁴ See p. 82, n. 1, above.

World, engraved on a brass plate, which the turn-coat 'quisling', Aristagoras of Miletus, is alleged to have brought with him on a mission to King Cleomenes I of Sparta in the hope of persuading Cleomenes to invade the Achaemenian Empire as a champion of the Imperial Government's malcontent Asian Hellenic subjects;¹ and a field-state of the expeditionary force with which Xerxes crossed the Dardanelles in 480 B.C.² The last two of these three alleged documents may be more or less authentic. A written statement of the order of battle of Darius III Codomannus's army at Gaugamela was, after all, captured on the field by the victors and has been reproduced, on the authority of Alexander's general Aristobûlus, by Arrian in his *Alexander's Expedition*;³ and this order of battle corresponds to a field-state given by Arrian at an earlier point.⁴ On the other hand the so-called gazetteer bears tell-tale marks of being an amateur compilation in which first-rate official information, drawn from more than one official source, has been used but, in being edited, has, here and there, been misinterpreted and also been 'scrambled' (no doubt, unintentionally).

The order in which the twenty taxation districts are placed by Herodotus—to consider this point first—cannot be the original order; for, as our six extant official lists of *dahyāva* testify, an official list drafted in the Imperial Chancery would normally have started, in a recital in which Pārsa was being omitted because it did not pay taxes, by naming Māda and Hūja (Ūvja), the two countries that shared with Pārsa the distinction of constituting the heartland of the Empire.⁵ By contrast, Herodotus's gazetteer starts with Yauna, goes on to Sparda in Yauna's immediate hinterland, and then recites all the other districts with seaboard on the Black Sea or on the Mediterranean—Katpatuka, Cilicia, Syria, and Egypt—before penetrating into the interior of the Empire. Even then this Herodotean gazetteer does not mention Hūja (in Herodotus's terminology, 'the Kissioi'), Bābiruš (in Herodotus's terminology 'Assyria') or Māda until after it has made a flying leap to the Thatagu[?d or v]iyā (*Graecè* Sattagy dai) in the Upper Indus Basin. The concentration of interest on the western seaboard of the Empire, where the Achaemenian dominions overlap with the eastern fringes of the Hellenic World, is likewise displayed in the order in which the gazetteer mentions the peoples embraced in a taxation district extending from the west bank of the Lower Halys to the Asiatic shore of the narrow seas connecting the Black Sea with the Aegean. We may presume that the most important of the cantons in this district was Katpatuka (*Graecè* Kappadokiê), since this is the only one of them that is mentioned in the Achaemenian official lists of *dahyāva*. Yet, instead of starting with the Cappadocians (*alias* 'White Syrians') and proceeding from east to west, the gazetteer, in its enumeration of the peoples in this taxation district, starts with

¹ Herodotus, Book V, chaps. 49–54.

² *Ibid.*, Book VII, chaps. 61–99.

³ Arrian: *Expeditiō Alexandri*, Book III, chap. xi, §§ 3–7.

⁴ In Book III, chap. viii, §§ 3–6.

⁵ Pārsa is placed at the head of all our six extant official lists. Māda is placed second in DZd, DSe, DNa, XPh, and third in DPe. Hūja is placed second in DB and DPe, and third in DZd, DSe, DNa, XPh. The one exception to this general rule of precedence is the placing of Media tenth in DB (i.e. in the place that Media occupies in Herodotus's gazetteer).

the Hellenic communities along the Asiatic shore of the Straits and proceeds thence from west to east till it arrives at the Cappadocians last of all.

It is perhaps conceivable that this drastic departure from the order of precedence observed in lists of *dahyāva* inscribed by the Imperial Government had been made in the provincial chancery of one or other of the three westernmost viceroyalties on the Asiatic mainland—Yauna, Karkā, or Sparda—before the list came into private Hellenic hands; but it would seem more likely that the provincial chanceries would have abode by the Imperial Chancery's practice, and that the violent change of order through which the western lands of the Empire have been given precedence over the heartland will have been the work of a private Hellenic man of letters—whether this was Herodotus himself or was some predecessor of his—who was concerned to adapt the Achaemenian official information that had come into his hands to the requirements of a book which was to be read to and by an Hellenic public and which must therefore present its picture of the Achaemenian Empire in a perspective calculated to commend it, not to Achaemenian, but to Hellenic eyes.

This officious Hellenic literary rearrangement of the official order of precedence of the Achaemenian Empire's lands and peoples has had its nemesis. It has caused Herodotus, or his unofficial Hellenic intermediate source, to lose his way in the maze of the Empire's vast interior as soon as he has had to let go of the alternative guide-rope which he has improvised for himself, after taking his starting-point in Yauna, by following the coastline of the maritime western lands, first north-eastward along the coast of the Black Sea and then south-eastward along the coast of the Mediterranean. Even this cue taken from Physical Geography for the filling of the first six of the twenty spaces in his blank form for a gazetteer of the Achaemenian taxation districts has already led the Hellenic amateur archivist into one error which would have involved him in difficulties in any case. It has led him to assign one of the twenty pigeon-holes at his disposal to the principality of Cilicia; and, though, down to the time of writing, the researches of Modern Western archaeologists had not yet disinterred an official list of Darius's original twenty taxation districts, it could be taken as almost certain that Cilicia was not numbered among the twenty, considering that Cilicia was not included in any of the six already known lists of *dahyāva* and that, on this showing, we must conclude that Cilicia ranked juridically as a sovereign independent state in spite of the political fact that this state happened to be one of the Empire's 'gift-bringing allies'. But the Herodotean gazetteer is vitiated by a far more serious flaw than its abandonment of the official order of precedence and its inclusion of a nominally independent state in the list of imperial taxation districts: it has drawn its information from more than one source, and at least two of its sources reproduce respectively two administrative maps which are not merely different from one another but are actually incompatible and which therefore cannot both be delineations of one and the same network of geographical subdivisions of the imperial domain. In the Herodotean gazetteer there are instances of the same peoples figuring twice over because they have

been attributed to two different taxation districts under two different names which Herodotus has not recognized as being the synonyms that they are in fact; there is at least one instance of the same territories figuring twice over because they have been assigned to two different administrative units which therefore cannot both have figured side by side on one and the same administrative map, though either of them may have figured simultaneously with the other on one of two different maps that will have been in force simultaneously for two different purposes; and there is also at least one instance of the same whole district figuring twice over under two different names. In consequence, Herodotus has found himself left with more names on his hands than he can find room for in his twenty pigeon-holes, and his desperate search for apparently vacant nooks and corners to house the surplus names has misled him into attributing geographically non-contiguous peoples to the same taxation district and, worse still, into introducing districts with overlapping frontiers on to what purports to be the same administrative map.

If we let our eye travel down Herodotus's list of his twenty taxation districts in the order in which he has presented them to us, we shall catch him adding to his embarrassments as he proceeds. After having reduced the number of the pigeon-holes at his disposal from the necessary twenty to nineteen by erroneously assigning one pigeon-hole to Cilicia, he goes on to reduce the number to eighteen by counting in Harahvatiš twice over, through a failure to detect that the Thamanaioi (*alias* Harahvatiyā) who occupy a pigeon-hole in one of his sources are identical with the Paktyes (*alias* Harahvatiyā) to whom he has already just assigned the pigeon-hole which, in another of his sources, the same Harahvatiyā occupy under this different name. A twentieth-century Western scholar could identify the habitat of Herodotus's Paktyes because their name—like that of Herodotus's Dadikai (Tajik) and Aparytai (Afridi)—was still borne by a living people. In the twentieth century of the Christian Era the North-East Iranian people whom foreigners knew as Afghans were still calling themselves 'Pakhtāna', 'Pashtāna', 'Pathān' in the divers dialects of their Iranian language;¹ and this survival of the name locates Herodotus's Paktyes in the Achaemenian *dahyāuš* that is named 'Harahvatiš' (eventually Hellenized as 'Arakhosia, *Latine* Arachosia') in the official lists. But this same Harahvatiš is also represented by Herodotus's 'Thamanaioi', as we can verify by comparing Herodotus's gazetteer of Darius I's taxation districts with his field-state of Xerxes' expeditionary force, since the two peoples called Outioi and Mykoi who are grouped with the Thamanaioi in the gazetteer are grouped with the Paktyes in the field-state. It is natural enough that one and the same *dahyāuš* should have been known by three alternative names; for, while 'Harahvatiš' is the name of the country² and 'Paktyes' is the proper name of the people inhabiting it, 'Thamanaioi' is a descriptive title. The sur-

¹ These were the plural forms; the corresponding singular forms 'Pakhtūn' and 'Pashtūn' were still closer to the Greek singular form 'Paktys'.

² The country seems to have taken this name from the river that was its lifeline (see A. V. W. Jackson in *The Cambridge History of India*, vol. i (Cambridge 1922, University Press), p. 321, n. 2; Olmstead, A. T.: *History of the Persian Empire* (Chicago 1948, University of Chicago Press), p. 46, n. 59).

vival, in a New Persian language, of the word 'dāmān',¹ meaning the skirt of a garment and, by analogy, a 'borderland' or 'march', tells us that 'Thamanaioi' means 'the borderers'; and Harahvatiš had, in fact, been the south-easternmost territory of the Achaemenian Empire until Darius had relegated it to the interior by annexing Sind and the country, corresponding in area approximately to a latter-day Makrān, which (though not named in any of the official lists) is included in Herodotus's gazetteer as his District No. 17, inhabited by Parikanioi and by Asiatic Ethiopians.

Thus, as a result of two mistakes—the assignment of one pigeon-hole (No. 4), instead of none, to the Cilicians, and the assignment of two pigeon-holes (Nos. 13 and 14), instead of one, to Harahvatiš in order superfluously to provide for both of Harahvatiš's two synonyms 'Pak-tyes' and 'Thamanaioi'—Herodotus ran through his twenty pigeon-holes without having disposed of all the names that had been thrust upon him by his divers sources. As we can see from the final shape of the gazetteer as he eventually published it, there were at least four names still on his hands after he had assigned his twentieth and last pigeon-hole to the Indoi. These four names were, first, a second set of Parikanioi, who were distinguished from the set already stowed by him in Pigeon-hole No. 17 by being bracketed, not with Ethiopians, but with Orthokorybantioi; second, these Orthokorybantioi who were bracketed with the still unhoused set of Parikanioi; third, the Armenians; fourth, the Sogdoi.

If Herodotus had only known it, two, at any rate, out of these four surplus names need not have worried him; for these two were already accounted for in the description of his District No. 12 which he had copied from one of his sources: 'the Baktrianoi as far as the Aiglai'. 'Aiglai', like 'Thamanaioi', is a descriptive title, if its meaning is 'allies';² and the people denoted by this title are the Sakā Haumavargā of the official lists who, in the foundation tablets at Persepolis and Ecbatana, are called 'the Sakā who are beyond Suguda',³ i.e. the Sakā inhabiting the upper basin of the River Jaxartes (*alias* Sir Darya), which, at the time of writing, bore the name 'Farghānah'. This surviving name is manifestly derived from that of the Parikanioi whom Herodotus found associated with the Orthokorybantioi; these 'parikanioi' (the Avestan 'pairikās', meaning

¹ In the Kingdom of Afghanistan in the early decades of the nineteenth century there were at least two areas bearing the name 'dāmān', and one of these—the 'Damaun' that 'comprehends all the country between the Salt-range, the Solimauny Mountains, the Indus and Sungur in Upper Sind' (Elphinstone, M.: *An Account of the Kingdom of Caubul*, 2nd ed. (London 1839, Bentley, 2 vols.), vol. ii, p. 55) may well have been included within the bounds of the Achaemenian *dahyāuś* whose people Herodotus calls 'Thamanaioi' in his description of his Taxation District No. 14. Another 'dāmān' was to be found in the nineteenth century of the Christian Era at the opposite extremity of the Kingdom of Afghanistan, to the north of Kābul, in the direction of the Hindu Kush. The pleasantness of this land, and the unpleasantness of its inhabitants the Tajiks (Herodotus's 'Dadikai'), are described at first hand by Alexander Burnes in *Cabool, A Personal Narrative of a Journey to, and Residence in, that City in the Years 1836, 7 and 8*, 2nd ed. (London 1843, Murray), pp. 146–66, and by Burnes' companion Captain John Wood in *A Journey to the Sources of the River Oxus*, new ed. (London 1872, John Murray), pp. 110–16.

³ See p. 590, above.

either 'sorcerers'¹ or 'fairy people' or 'fairy-worshipping people'²) are identical with the 'allies' ('Aiglai') of the Achaemenian Empire who were also officially known as 'Sakā Haumavargā'; the 'Orthokorybantioi', whom Herodotus had found bracketed with the 'Parikanioi' in one of his sources, are 'the Pointed-Hood Sakā' who are bracketed with 'the Hauma-(?)drinking Sakā' in the three latest of the six official lists;³ and the Sogdoi, though not mentioned by name in the description of District No. 12, are included in it by implication, since a district which extended from Bactria as far as a Farghānah which was the habitat of the Empire's Hauma-(?)drinking Sakā allies could not have left the intervening country out, and this intervening country was Sogdiana. The Sogdoi had thus, after all, been provided for, and the Sakan Parikanioi had no right to a place in the gazetteer of taxation districts, since, like the Cilicians, they were, juridically, not tax-paying subjects of the Achaemenian Empire, but gift-bringing sovereign independent allies. In the formula 'as far as the Aiglai' the term 'as far as' was evidently being used in an exclusive, not in an inclusive, sense, and the couple of names 'Parikanioi-Orthokorybantioi' must have come into Herodotus's hands from a list, which like the six extant official lists, was not a gazetteer of taxation districts, but was a selection of *dahyāva* of divers status.

This satisfactory solution of half his residual difficulties must, however, have escaped Herodotus's notice; for the expedient by which he has sought to extricate himself is the unlucky one of stuffing the Parikanioi and Orthokorybantioi into Pigeon-hole No. 10, already assigned to Media, and stuffing the Sogdoi into Pigeon-hole No. 16, already assigned to the Parthoi, Areioi, and Khorasmioi. This desperate remedy has made nonsense of the gazetteer in two several ways: it has resulted in the Sogdoi and the Hauma-(?)drinking Sakā of Farghānah figuring in the gazetteer twice over in different contexts, and it has resulted in the attribution of non-contiguous peoples to the same taxation district. The Hauma-(?)drinking Sakā (who ought not to figure in any taxation district at all) appear in District No. 10 as 'Parikanioi', besides appearing as 'Aiglai' in the description of District No. 12; the Sogdoi appear in District No. 16 *nominatim*, besides being included by implication in District No. 12. On the point of non-contiguity, it is, of course, geographically inadmissible to brigade Sogdiana with Parthia, considering that the intervening territory—Marguš—is known, from the evidence of 'DB', to have been included in Bākhtriš; it is a geographical absurdity to brigade with Media 'the

¹ In the Avestan Iranian language the feminine singular 'pairikā' means 'witch'.—Professor Roland G. Kent.

² See Nyberg, H. S.: *Die Religionen des Alten Iran*, in *Mitteilungen der Vorderasiatischen-Ägyptischen Gesellschaft*, 43. Band (Leipzig 1938, Hinrichs), pp. 297, 314 seqq., 340, 469.

³ In another context—in his field-state of Xerxes' expeditionary force—Herodotus catches an echo of the official distinction between the two branches of the Sakā, only to confound them with one another. After giving, in Book VII, chap. 64, a description of 'the Pointed-Hood Sakā'—he calls them 'Skythai wearing stiff upright pointed kyrbasiai'—he goes on to say that these particular Skythai were called Sakai Amyrgioi (i.e. Sakā Haumavargā) by the Persians. Herodotus did not notice that the Orthokorybantioi whom he had brigaded with the Medes in his gazetteer were the same people as 'the Pointed-Hood Sakā' of his field-state.

Pointed-Hood Sakā', who were separated from Media by the whole breadth of the Viceroyalty of Parthava, and *a fortiori* to brigade 'the Hauma-(?)drinking Sakā' with Media, since these were separated from Media not only by the Viceroyalty of Parthava but also by the sub-empire of Bākhtriš beyond that.

After having fallen into these errors as the price of disposing of three out of his four surplus names, Herodotus fell into another error in disposing of Armenia. The process of reasoning that led him to the manifestly erroneous conclusion that the Armenians were brigaded with Southern Afghanistan in one and the same taxation district may perhaps be reconstructed as follows.

As Herodotus was re-examining his divers materials in search of a vacant space in which Armenia could be stowed, we may conjecture that his eye caught, in one of his cahiers, an entry that had been transliterated into Greek 'Paktyikê and Armenioi and the adjoining peoples as far as the Black Sea'; and here (if our guess is right) he fancied that he had found salvation; for 'Paktyikos' is the Greek adjective corresponding to the Greek substantive 'Paktyes'; and the Paktyes already had a pigeon-hole of their own in District No. 13 (duplicating District No. 14, which had also been assigned by Herodotus inadvertently to the Paktyes under their *alias* 'Thamanaioi'). Now that the Armenians had proved to have been included in the same administrative area as the Paktyes, Herodotus's last difficulty will have seemed to him to have been overcome. He had only to replace 'Paktyes' by 'Paktyikê and Armenioi and the adjoining peoples as far as the Black Sea' as the label for his District No. 13, and he would have completed his task of making all the names in his divers cahiers fit into the twenty pigeon-holes at his disposal. At this point it must have escaped his notice that the peoples adjoining the Armenians as far as the Black Sea could be none other than the Moskhoi, Tibarênoi, Makrônes, Mossynoikoi, and Mâres, to whom he had already assigned a separate pigeon-hole of their own (his District No. 19); and furthermore he cannot have been fully alive to the improbability of an apparent solution which was committing him to the thesis that peoples with a frontage on the Black Sea could have been included in the same taxation district as a people whose home lay at the eastern extremity of the Empire.

All the same, when he came to write his introductory note for his gazetteer as he was now presenting it, the awkwardness of this thesis seems to have forced itself upon his attention. The first sentence of the introductory note runs:

'When Darius had set up his vicerealties and had appointed viceroys for them, he assessed taxes that were to be paid to him by single peoples in some cases and in other cases by syndicates in which a people's neighbours were brigaded with it.'

We may guess that this sentence was a correct statement of the truth, and that it was copied out by Herodotus verbatim from one of his sources; but, as he copied the word 'neighbours' (*πλησιοχώρους*), a misgiving must have assailed him. He must have recollected that, in

the gazetteer as he had now edited it, the Armenians of Eastern Anatolia figured in the same district as the Paktyes of Eastern Iran. This must (he would have reassured himself) be correct, since one of his sources (as interpreted by him) had vouched for it; and, besides, he would find himself with the Armenians on his hands again if he were to reject this welcome solution now on second thoughts. All the same, he was bound to feel uncomfortable about a solution of a particular problem that was in flat contradiction with the general statement in one of his sources that all members of a taxation-syndicate were contiguous with one another. He could not leave it at that, considering that he had taken for the label of his Taxation District No. 13 a statement by one of his authorities that the Paktyes (whom he knew of as an East Iranian people) were syndicated with the Armenians and with peoples adjoining the Armenians who had a seaboard on the Black Sea. So Herodotus (if our reconstruction of his process of composition is correct) uneasily took up his pen again and amplified the introductory note by appending the following *contradictio in adjecto*:

'And in other cases he passed over the adjoining peoples and assigned the [non-contiguous] peoples on the farther side of [the peoples that he had passed over] to the same taxation district as the peoples [on the nearer side of them].'

This additional sentence, which makes the introductory note self-contradictory, was, we may suppose, extorted from Herodotus by his own previous manipulation of the contents of a gazetteer that he had compiled, at his peril, from more than one source;¹ but this does not mean that the entry 'Paktyikê and Armenioi and the adjoining peoples as far as the Black Sea' had made nonsense in the original context out of which Herodotus had lifted it in order to substitute it for the entry 'Paktyes', taken from a different source, with which he had mistakenly assumed that an entry opening with the word 'Paktyikê' must be identical. All that was the matter with the entry beginning 'Paktyikê' was that it belonged to the political map of the Achaemenian Empire as this had been organized by Cyrus II after he had ousted Astyages from the throne of Media, and not to the fiscal map of the Empire as this had been organized by Darius I after the anarchic year 522-521 B.C. When it was retransferred to the political map, to which it properly belonged, from the fiscal map, into which Herodotus had mistakenly introduced it, this entry would make sense, as we shall see.²

Administrative Geography and Political History

The coexistence of two different administrative maps of the Achaemenian Empire—one fiscal and the other political—of which Herodotus has thus unwittingly preserved an indication in his gazetteer, throws light on a dark passage in the Empire's political history.

The constant ideal of the Achaemenian régime was to govern as far

¹ A tentative reconstruction of the authentic list of Darius's original twenty taxation districts is presented in Table VI, folding out opposite p. 772, below.

² On pp. 604-11, below.

as possible with the consent of the governed; and, while the originator of this ideal had been the founder of the Empire, Cyrus II, the restorer of the Empire, Darius I, showed—for example, by his policy in Egypt—that he too had taken the founder's ideal to heart. The difference between Darius's position and Cyrus's was one not so much of ideals as of possibilities of putting ideals into practice. The nemesis of Darius's assassination of a reigning emperor who, truly or falsely, had claimed to be Cyrus's son Smerdis had been the outbreak of the widespread *émeute* of 522–521 B.C., and the nemesis of this terrible year had been a grievous and irretrievable blow to the system, which Cyrus had created, fostered, and succeeded in bequeathing to his successors, of governing with the consent of at least a large minority of the governed.

Though Cyrus II's usurpation of Astyages' Median throne had not been either accomplished or maintained without bloodshed, Cyrus seems nevertheless to have managed to achieve the all-important political objective of sparing the Median imperial people's susceptibilities by saving their 'face'. He seems to have been able to avoid creating the impression either that the Medes were being ousted by the Persians or that the House of Cyaxares was being supplanted by the Cyran branch of the House of Achaemenes. He ascended the Median throne as a grandson of Astyages who had been substituted for his grandfather by the suffrages of a preponderant party among the Medes themselves, and he associated his own people—the men of Parsuwaš, Anšan, and Pārsa—with their imperial kinsmen the Medes on a footing, not of superiority, but of strictly equal partnership. The same fundamental policy of conciliation was likewise applied by Cyrus in the far more difficult case of his conquest of the Neo-Babylonian Empire. Thanks to the Babylonian priesthood's quarrel with Nabonidus, Cyrus was able to occupy the throne of Babylon as the Babylonian priesthood's champion and candidate. As for the peoples of Eastern Iran and North-Western India whom Cyrus appears to have brought under his rule between his enthronement in Media *circa* 556–550 B.C.¹ and his attack on the Neo-Babylonian Empire in 539 B.C., the speed and ease with which he established his authority over these vast tracts of territory was perhaps his reward for presenting himself there as a champion of Sedentary Civilization against Nomadism (a cause in which he eventually proved his sincerity by losing his life in its pursuit); for a majority of the sedentary peoples in the Oxus-Jaxartes Basin and the Indus Basin had suffered cruelly from Eurasian Nomad invasions within living memory.

Cyrus II's policy of governing as far as possible by consent was reflected in the structure of his administrative map. His normal practice seems to have been to respect the territorial integrity of the *ci-devant* empires that he had converted into viceroyalties within a universal state; and, during Cyrus's own reign, the Lydian Empire—where there was an abortive revolt shortly after the original conquest²—seems to have been

¹ The overthrow of Astyages by Cyrus II is dated 550–549 B.C. in the Babylonian Nabonidus-Cyrus Chronicle, 556–555 B.C. in another Babylonian historical document, according to Weissbach, F. H., s.v. 'Kyros', in Pauly-Wissowa: *Realencyclopädie der Classischen Altertumswissenschaft*, Neue Bearbeitung, Supplementband IV, cols. 1142–3.

² See Herodotus, Book I, chaps. 154–60.

the only one of Cyrus's territorial acquisitions which the conqueror found himself compelled to partition between two separate viceroyalties as the price of maintaining his hold upon it.¹ The former Neo-Babylonian, as well as the former Median, Empire was converted by Cyrus intact into a single viceroyalty; and in the North-East, on the Achaemenian Empire's most dangerous frontier, where the trans-frontier barbarians were the formidable Eurasian Nomads, a Viceroyalty of Bākhtriš that was a sub-empire in itself was either preserved by Cyrus or perhaps actually called into existence by him to serve as the Empire's principal anti-Nomad march.

In Herodotus's gazetteer of Darius's taxation districts the boldly generous Cyran political map has, for the most part, been replaced—and this, of course, correctly—by a cautiously repressive Darian fiscal map reflecting the usurper's reaction to his fearful ordeal in 522–521 B.C.

Darius's assumption of the Imperial Crown had—as we know from Darius's own record—been the signal for a widespread attempt to throw off the Achaemenian yoke (light though this had been so far) and to re-establish the pre-Cyran régimes in empires that Cyrus had deprived of their former sovereign independence. The Medes, for instance, who, in accepting Cyrus II, had been accepting as a legitimate heir to the Median throne a scion of the Cyran branch of the House of Achaemenes whose mother had been a Median princess, could have no such grounds for feeling any loyalty to a pretender, descended from the Ariaramnan branch of the Achaemenidae, who had no Median royal blood in his veins and who had won the imperial throne by assassinating a reigning emperor who had at least professed to be Astyages' great-grandson.

In A.D. 1952 there was no means of knowing for certain whether the Smerdis whom Darius had assassinated had indeed been the authentic son of Cyrus II or whether he had been the impostor that Darius asserts that he was;² and there was also no information about the previous

¹ See pp. 671–3, below.

² The following expert opinion has been given to the writer by Professor Roland G. Kent:

"I accept the account of a true Smerdis, son of Cyrus, and of a false Smerdis, the Magian Gaumāta, for several reasons. (1) The account of Darius himself on the Behistan Rock, and the account by Herodotus, agree in the essentials, though differing in details. (2) If Darius had slain the true Smerdis, son of Cyrus and brother of Cambyses II, and if the fact had been known widely enough to have resulted in the sundry uprisings related by Darius in his inscription, it is hardly conceivable that no hint of this should have come down in the literature, and especially that the inveterate gossip Herodotus, in all his lengthy account of the event, should have given no indication that there was a differing version. (3) Further, if Darius had had to justify his slaying of the real brother of Cambyses, he would have had at hand a much better account to set before the World, and a true account at that, better than what in that case would have been a cock-and-bull story about his having slain an impostor.

"When Darius slew (true or pseudo-) Smerdis, he needed no fanciful story to justify him. All that he had to say was that Smerdis' father had wrongfully deprived his (Darius's) grandfather Arsames of the throne of Persia (or Persis), and that he was avenging the wrong done to his line. Old Arsames was no longer physically able to reassume the sovereignty, so Darius took it for himself. He did not need to invent a pseudo-Smerdis, so why place himself in the position of a liar about the whole matter? Therefore, in view of the concurrent testimony of the Inscription of Behistan and of Herodotus, I believe that the true Smerdis had been murdered previously (unless he had died of natural causes just at that time) and that a Magian named Gaumāta had assumed his place and was presently killed by Darius and his helpers. Note that Darius

relations between the two branches of the House of Achaemenes—perhaps because there had never been a moment at which it had suited either branch to give publicity to facts which, it might be suspected, were to neither branch's credit. Supposing that the Smerdis whom Darius assassinated had been, and been known by Darius to be, the

lists his helpers on the inscription, and that the names agree, with but slight variations, with those given by Herodotus.'

A statement of the case for the contrary thesis that the reigning emperor whom Darius assassinated was the authentic Smerdis, the son of Cyrus II, is presented by A. T. Olmstead in his *History of the Persian Empire* (Chicago 1948, University of Chicago Press), p. 109, as follows:

'Darius claims that Bardiya [*Graecè* Smerdis], younger brother of Cambyses, was put to death by that brother. Yet there is complete disagreement between our sources as to the time, place, and manner of his murder. Darius puts the episode before the Egyptian expedition of Cambyses, Herodotus during it, and Ctesias after. The official version followed by Herodotus blames a certain Prexaspes for the actual murder, but there was doubt as to whether "Smerdis" was killed while hunting near Susa or was drowned in the Erythraean Sea. After the death of Cambyses, we are expected to believe, Prexaspes publicly recanted his story, informed the people of the secret murder of the "true" Bardiya, and then in repentance committed suicide. Deathbed repentances we all know as frequent devices of the propagandist; after a suicide, the dead man can tell no tales. Furthermore, the "false" Smerdis was false only in claiming to be the son of Cyrus; his actual name *was* Smerdis! The height of absurdity is reached when we are informed that so alike were the "true" and the "false" Smerdis that even the mother and sisters of the "true" Smerdis were deceived! Contemporary Aeschylus had no doubt that Mardos, as he calls him, was a legitimate monarch and that he was slain by the wiles, not of Darius, but of Artaphrenes, one of the "Seven" (Aeschylus, *Persae*, lines 774-7). . . . Last, but far from least, Darius so continuously insists that all his opponents—the "false" Bardiya in particular—are liars that we are convinced he "doth protest too much". It is significant that in Herodotus, Book III, chap. 72, Darius is made to give an elaborate defence of lying.'

The present writer, who was only an amateur in Achaemenian history, was not competent to judge between the authorities on points on which these disagreed with one another. On the issue here in question he would confine himself to recording that, in the first draft of the present passage, he had rashly ventured to opt for the view that Darius's victim had been the authentic Smerdis son of Cyrus II, and that he had been convinced of this as a result of several times rereading 'DB'. The impression made on his mind by Darius's ostensibly frank account of the dramatic events of the first year of his reign had been just the opposite of the impression that Darius himself, in 'DB', is manifestly striving to create. At each repetition of Darius's assertion that he alone is speaking the truth and that each of his rivals is a liar, one reader, at any rate, had come more and more strongly to suspect that Darius must have some portentous lie and crime on his own conscience; and he had actually concluded this now expunged passage in his first draft by quoting the line from Shakespeare, *Hamlet*, Act III, scene ii, on which Olmstead concludes his statement of the case for the prosecution. (This might, of course, have been a subconscious reminiscence of the passage, quoted above, in Olmstead's book, which the present writer had read several years back.)

On this last point, Professor R. G. Kent, in a note to the present writer, suggests that, in calling his rivals 'liars', Darius is using the word in the technical theological sense of subscribers to a false religious doctrine (i.e. to a religion other than Darius's own worship of Ahuramazda). Evidently this interpretation of the compound substantive 'lie-follower' (O.P. *draujana*) would be possible—though the non-technical translation 'liar', in the plain ordinary meaning of the word, would also be possible—in 'DB', §§ 63 and 64; on the other hand, in § 52 the verb 'he lied' (O.P. *adurujīya*) is used no less than nine times running to stigmatize the pretensions of Darius's defeated rivals. The same verb is used with the same plain meaning in § 11, with reference to the 'false' Smerdis' claim to be the authentic Smerdis; in § 16, with reference to Nidintu-Bel's claim to be Nebuchadrezzar the son of Nabonidus; and in § 49, with reference to the Armenian Arkha son of Haldita's claim to be Nebuchadrezzar the son of Nabonidus. As for § 10, the most natural interpretation of the sentence 'After that the Lie waxed great in the country, both in Persia and in Media and in the other provinces', is surely not that the worship of Ahuramazda receded before the advance of rival religions, but that there was a widespread disposition to accept, at its face value, the 'false' Smerdis' claim to be the true Smerdis, because (in the words of the last sentence but one before this sentence) 'when Cambyses slew Smerdis, it did not become known to the people that Smerdis had been slain'.

rightful owner of the name and in consequence the legitimate heir of Cyrus II, it was conceivable that, from the Ariaramnan branch's standpoint, Darius, in thus assassinating the true Smerdis, would have simply been taking a belated but justifiable revenge for an earlier *coup d'état*, whatever the date and circumstances of this might have been, which had resulted in the deposition of Darius's grandfather Aršāma, and exclusion of his father Vištāspa, from the throne of Pārsa, after Darius's great-grandfather Ariyāramna had ruled in Pārsa and had, perhaps, even exercised a suzerainty over his brother Cyrus I's appanage in Parsuwaš and Anšan as well.¹ This Ariaramnid point of view, however, was not calculated to appeal to the peoples who had acquiesced in the rule of the Cyran branch of the Achaemenidae.

These peoples might not much care whether the emperor whom Darius had murdered was or was not the genuine Smerdis son of Cyrus, or whether Darius had or had not been justified in murdering him, whatever his identity might be. A murder which, in Darius's eyes, would have been primarily an incident in a family quarrel if it was not the exposure and punishment of an imposture, as Darius himself declared it to be, was a sensational piece of news for the Cyran House's former subjects—above all, for those of them who were Medes—because it was conclusive evidence that the Cyran House had now become extinct, without having left any legitimate male heir to succeed to its title. If the Smerdis whom Darius had just murdered was not the authentic son of Cyrus, then either this impostor or Cambyses must previously have taken the authentic Smerdis' life; and, on either of these two alternative possible hypotheses, the Cyran House's subjects now found themselves absolved from their allegiance by the disappearance of the dynasty to which this allegiance had been owed. Unlike the death of Cambyses, the death of Darius's victim, whoever he might have been, had made it certain that there was now no surviving legitimate representative of the imperial line of Astyages and Cyrus II; and evidently this was why, in contrast to the first of these two successive pieces of sensational news, the second was followed by pronunciamientos of insurgents who claimed to be the legitimate representatives of dynasties that Cyrus II had deposed and superseded.

The gruesome fate of all these rivals of Darius's who fell into Darius's hands (as every one of them did, sooner or later) did not deter others from trying their luck in turn. The rendition to Darius of the Elamite pretender Ačina by the Elamites themselves was followed by the *pronunciamiento* of a second pretender to the Elamite throne in the person of Martiya. The overthrow of Nidintu-Bel, the pretender to the throne of Babylon, was followed by the *pronunciamiento* of a second

¹ See Cameron, G. G.: *A History of Early Iran* (Chicago 1936, University of Chicago Press), pp. 212 and 214. In a letter to the present writer, Professor Cameron drew his attention to Sidney Smith's rejection of his thesis that Cyrus I of Anšan was under his brother Ariaramnes of Pārsa's suzerainty (see Smith, S.: *Isaiah, Chapters XL-LV, Literary Criticism and History* (London 1944, Milford), p. 122, n. 31, referring to p. 28). If the case for Cameron's thesis rests on the attribution of the title 'King of Kings' to Ariaramnes in 'AmH', it would, no doubt, be invalidated by Professor R. G. Kent's finding (see p. 622, n. 1 below) that 'AmH' was a forgery made by Artaxerxes II for a political purpose.

pretender, Arkha. The defeat, flight, capture, and execution of the Median pretender Fravartiš was followed by the *pronunciamiento* of a second Median pretender, Ciçantakhma. Moreover, the pretenders in Media, unlike those in Elam, were the leaders of a genuine national revolt, and this national revolt was not confined to the Medes themselves; the other peoples of the former Median Empire—the Northern Asagartiya, the people of Varkāna, the Parthavā, and, above all, the Arminiya—revolted likewise, and the Armenians seem to have given Darius more trouble than the Medes themselves. Most significant of all, Darius's title was disputed by some of his fellow Persians. Martiya, the second insurgent in Elam, was a Persian in nationality,¹ though he claimed to be a scion of the former Elamite royal family; and so was Vahyazdāta, the insurgent in Yautiya, a country which Darius expressly describes as lying within the bounds of Pārsa.²

These facts, for which our authority is Darius himself, make it clear that some Persians, as well as most Medes, believed that the murder committed by Darius, if not a previous murder by some other hand, had extinguished the last legitimate representative of the houses of Cyrus I and Cyaxares which had been united in the persons of Cyrus II and his sons, and that they were therefore now morally free to make their own choice of a ruler, and certainly free from any obligation to accept Darius's claim to be Cyrus II's legitimate successor. This was why the death of Darius's victim in 522 B.C. had the same catastrophic effect as Nero's suicide in A.D. 69. The consequent certainty that now, at any rate, no authentic heir of the legitimate dynasty remained alive opened the flood-gates for an outburst of anarchy.

This is the background against which we have to read the Median portion of Herodotus's gazetteer of Darius's taxation districts. In this gazetteer, as we shall see,³ Media is partitioned into four separate districts. Besides District No. 10, which is duly labelled 'Media' by Herodotus, there is his district No. 11, which appears to cover a strip of territory extending westward, between the Elburz Range and the Central Desert of Iran, from the narrow passage between them that was known as 'the Caspian Gates'. There is also Herodotus's District No. 18, which appears to cover the Basin of Lake Urmīyah, together with the former territory of Assyria to the east of the Tigris (annexed by Media when she had partitioned the Assyrian Empire with her Babylonian ally) and with the former kingdom of Urartu (annexed by Media subsequently). It is probable, too, that Herodotus's District No. 15 likewise is another fragment of Media, consisting of the steppe country round the lower courses of the rivers Aras and Kur, where they join one another before their common debouchure into the Caspian Sea. Finally, we find a detachment of Medes marooned, far from home, in the islands of the Persian Gulf, as one of the peoples included in Herodotus's District No. 14. The Median origin of these *déracinés* is revealed in the field-state of Xerxes' expeditionary force, in which their equipment and armament are described as being almost identical with those that the

¹ See 'DB', § 22.

² See 'DB', § 40.

³ On pp. 623–32, below.

Medes wore;¹ and their inclusion in District No. 14 is also significant, since these dissident Medes were interned there next door to the dissident Persian clan called the Yautiyā (Outioi). The south-western quarter of District No. 14 was, in fact, a prison for the most heinous of the Median and Persian offenders against Darius; and, as a further precaution, the prisoners there had been chained to the loyal Harahvatiyā (*alias* Paktyes, *alias* Thamanaioi) in Southern Afghanistan, who had been rewarded for their trustworthiness by being conscripted to serve as jailers.²

Herodotus's gazetteer of Districts Nos. 10, 11, 18, 15, and 14 thus informs us that Darius took the opportunity of his redivision of the Empire for fiscal purposes in order to insure himself against the risk of a fresh national insurrection in Media by breaking Media up for these purposes, besides deporting a portion of the Median people; but there are two other passages in Herodotus's work in which Media is credited with a much wider extension, at any rate towards the north, than can be attributed to the district labelled 'Media' and numbered '10' in the gazetteer of Darius's taxation districts. When Herodotus is indicating³ the region of Media which was the home, according to the Cyrus legend, of the hero's bucolic foster parents, and again when, in quite a different context,⁴ he is discussing the boundaries of 'Europe' and 'Asia', he makes Media march on the north with the country of the Saspeires, and these Saspeires with the Colchians, who have a seaboard on the Black Sea; and these two passages, while in harmony with one another, are incompatible with the administrative geography of the gazetteer; for, in the gazetteer, District No. 18, in which the Saspeires are included, also comprises the Matiēnoi and the Alarodioi, and in A.D. 1952 it could still be discerned that the 'Alarodioi'—Herodotus's rendering of the ethnicon of 'Urartu', which was situated in the basin of Lake Van and along the middle and upper reaches of the valley of the River Aras—and the Matiēnoi, who stamped their name on the basin of Lake Urmīyah, must have lain between the Saspeires—a people who had bequeathed their name to the canton of Isbir in the upper valley of the River Choroq—and the environs of Hamadān, to which the name 'Media' is confined in the gazetteer. This means that, in the two passages now in question, Herodotus is including in Media at least one district which is not included in Media in the gazetteer; and the explanation must be that these passages record the political boundaries of the Viceroyalty of Media as these had been established by Cyrus before Media had been partitioned by Darius for fiscal purposes in consequence of her insurrection in 522–521 B.C. Herodotus is here describing a Viceroyalty of Media which includes Urartu as well as the Basin of Lake Urmīyah between Urartu and the heart of Media round Ecbatana.

We can now also see that these two passages are not the only places in which Herodotus is writing in terms of a political map which is antecedent to—but on paper, at any rate, has not been superseded by—

¹ Herodotus, Book VII, chap. 80.

² See further pp. 622 and 640, below.

³ In Book I, chap. 110.

⁴ In Book IV, chap. 37.

Darius's precautionary partition, for fiscal purposes, of perilously large political units that Cyrus II had left intact. This officially surviving integral Viceroyalty of Media has a counterpart and neighbour in an officially surviving integral Viceroyalty of Armenia, and this is the geographical entity that has found its way into Herodotus's edition of the gazetteer of Darius's taxation districts in the formula 'Paktyikê and Armenioi and the adjoining peoples as far as the Black Sea', which Herodotus has taken for the description of his Taxation District No. 13.

The region to which the name 'Armina' or 'Arminiya' had originally attached seems to have been the country—occupying the upper basin of the Tigris and extending thence farther north-westward into the north-west corner of the basin of the Euphrates, where the two arms of the Upper Euphrates unite—which the Assyrians had called 'Naïri'. The first wave of Assyrian settlers in Naïri—some of whom had been established in the reign of Shalmaneser I in the thirteenth century B.C.—had been submerged by the cataclysm of the Aramaean *Völkerwanderung* out of the North Arabian Steppe at the turn of the second and the last millennium B.C. Thereafter, Asshurnazirpal II had reasserted the Assyrian Crown's authority over dissident descendants of these Assyrian settlers in 882 B.C. and had annexed the Aramaean principality of Bit Zamani in 879 B.C. In this quarter the extension of Assyrian rule had been at its widest *circa* 799 B.C.; thereafter, the whole of Naïri except an isolated enclave round Amedi (*Latinè* Amida, *Arabicè* Diyār Bakr), the former capital of Bit Zamani, had been conquered from Assyria by Urartu; the south-western part of the lost Assyrian domain in Naïri (i.e. the province later known to post-Alexandrine Hellenic geographers as Sophênê) had then been reconquered by Tiglath-Pileser III in 739 B.C.; but the south-eastern part (*Graecè* Arzanênê) had remained a debatable territory;¹ and the eventual beneficiaries from a stubborn, long-drawn-out, and indecisive contest between Assyria and Urartu in this arena had been the Thracian-speaking followers of the Mushkian (i.e. Phrygian) war-lord Gurdi (*Graecè* Gordios).

In 695 B.C., Sennacherib had attempted, without success, to dislodge Gurdi's war-band from Til-Garimmu (*Hebraicè* Togarmah), astride the road leading south-eastward from Sivas in the upper basin of the River Qyzyl Irmağ (*Graecè* Halys) to Malatīyah (*Assyriacè* Meliddu) in the valley of the Tokhma Su (a west-bank affluent of the Upper Euphrates).² Upon the collapse of the Assyrian Power after the death of Asshurbanipal, the Mushkian invaders to whom Gurdi had bequeathed his name swooped down from the north-west towards the heart of Assyria till their path was crossed by Sagartian invaders swooping down from the north-east upon the same objective—if the Kardoukhoi whom Xenophon and his comrades encountered in the tangle of mountains—known to post-Alexandrine Hellenic geographers as Gordyênê—south of the River Bohtān (*Latinè* Centrîtês)³ are to be identified with the descendants of Gurdi's men, and if the latter-day place-name Si'irt

¹ These vicissitudes in the history of Naïri are recorded in Forrer, *op. cit.*, pp. 25-33 and 84-87.

² See *ibid.*, pp. 80-81.

³ See Xenophon: *Expediitio Cyri*, Book III, chap. v, § 14—Book IV, chap. iii.

(*Armeniacè* Sghert or Sgherd), borne by a town near the confluence of the River Bohtān with the Eastern Tigris, testified that the north-western branch of the Iranian-speaking Nomad Asagartiyā had once pushed their way that far westward from their previous habitat somewhere to the east or south-east of Lake Urmīyah.¹

The seventh-century Median settlers in the metropolitan territory of Assyria east of the Tigris and the contemporary Phrygian settlers in the region known by the Assyrians as 'Nāiri' and by the Achaemenidae as 'Armina' seem to have met at the south-eastern corner of the Upper Tigris Basin without falling out with one another.² By the time, in or after 585 B.C., when the course of the River Halys, from the point where it emerged from the Kingdom of Cilicia down to its mouth, was accepted by the Median and the Lydian Empire as the frontier between them, 'Armina' must already have been incorporated into the Median Empire; but the simultaneous insurrection of Armina and Māda against Darius in 522 B.C., and the strength of the resistance that the insurgents in Armina offered to Darius's forces, are facts which indicate that the previous relations between Armina and Māda had been friendly; and a clue to the grounds of this friendship is perhaps to be found in the title 'Paktyikē and Armenioi and adjoining peoples as far as the Black Sea' which Herodotus has taken for his description of Darius's thirteenth taxation district—if we are right in seeing in this formula the description, not of any Darian taxation district, but of an integral Viceroyalty of Armenia which, like the integral Viceroyalty of Media, will have been established under the Median imperial régime of Cyaxares and Astyages; will have been maintained as a going concern under the Medo-Persian imperial régime of Cyrus II, Cambyses and a *soi-disant* Smerdis; and will not have been officially abolished by Darius I in being partitioned by him for fiscal purposes.

The formula suggests that the whole of the territory added to the Median Empire by Cyaxares to the west of Urartu, to the east of the Lower Halys, and to the north of a Kingdom of Cilicia which bestrode the middle course of the Halys in the neighbourhood of Mazaka, had been included by Cyaxares in a single viceroyalty; and, if this interpretation is correct, it would mean that Cyaxares had reconciled the Phrygian

¹ This identification is suggested by Herzfeld, E.: 'Zarathustra, Teil I', in *Archäologische Mitteilungen aus Iran*, Band I (Berlin 1929-30, Reimer), pp. 76-124, on p. 81, n. 1. Professor G. G. Cameron makes the following cautionary comment: 'This interpretation of "Kardoukhoi" as meaning "Gurdi's men", and, even more, the interpretation of Si'irt as being an echo of "Asagartiyā", is really playing with fire. I want more linguistic evidence.'

A derivation of the ethnicon 'Kardoukhoi' and the place-name 'Gordyēnē' from the personal name 'Gurdi (Gordios)' is, indeed, impugned by the appearance of 'the wide-spreading Kurti warriors' in the annals of the Assyrian King Tukulti-Ninurta I, who reigned in the second half of the thirteenth century B.C. (see Luckenbill, D. D.: *Ancient Records of Assyria and Babylonia* (Chicago 1926-27, University of Chicago Press, 2 vols.), vol. i, pp. 143, 152, 164, 171), and in the record of the campaign in the accession year of King Tiglath-Pileser I (*regnabat* 1114-1076 B.C.) (see op. cit., vol. i, pp. 222 and 229). If these Kurti were one of the Phrygian hordes that overwhelmed the Empire of Khatti at the turn of the thirteenth and twelfth centuries B.C., the personal name of the seventh-century Phrygian war-lord Gurdi will have been derived from the ethnicon 'Kurti', not vice versa, and will have signified 'the Phrygian'.

² So far from clashing, they appear to have amalgamated; for the latter-day Kurds, who perhaps bore Gurdi's name, spoke an Iranian, not a Thracian, dialect.

settlers in Nāiri-Armina to a voluntary acceptance of a Median overlordship by taking them into partnership with the Median imperial people and conferring on them a sub-empire covering the Median Empire's western marches. This would be a counterpart of the policy by which Cyrus II, in his day, appears to have reconciled the Bactrians to a Medo-Persian overlordship; and, in this case as in that, we can see that the two parties were bound to one another by a common interest which constituted a practical guarantee that the paramount Power's generosity would not be abused by the beneficiaries from it. Though the Phrygian invaders of Nāiri-Armina and the Median invaders of Adiabênê might have been competitors in the scramble for the spoils of a defunct Assyrian Empire, they still had an abiding common interest in standing shoulder to shoulder against a surviving common enemy who remained formidable after Assyria had been annihilated.

This abiding common enemy was the Nomad Power which had erupted out of the Great Eurasian Steppe into South-West Asia before the end of the eighth century B.C. If we have been right in thinking that, at some date between 556 B.C.¹ and 539 B.C., Cyrus II took the Bactrians into partnership and entrusted to them the surveillance over their Nomad neighbours the Sakā Haumavargā in Farghānah, we may perhaps now go on to hazard the guess that, in making this settlement of his north-eastern frontier, he was following a precedent that had been provided for him by Cyaxares' settlement of his north-western frontier at some date between 610 and 585 B.C. We may guess that Cyaxares had taken into partnership the Phrygian settlers in the country which the Achaemenian lists of *dahyāva* call 'Armina', and that he had entrusted to them the surveillance over Nomad neighbours of theirs whose tribal name was Paktyes and who had established themselves in the sixth century B.C. within the bend of the Halys, in the country which the Achaemenian lists call 'Katpatuka'.²

If the Paktyes were one of the Eurasian Nomad peoples who, in and after the eighth century B.C., had erupted out of the Great Eurasian Steppe into South-West Asia through the gap between the Pamir Plateau and the south-east corner of the Caspian Sea,³ it would not be

¹ See p. 598, n. 1, above.

² Professor G. G. Cameron makes the following comment: 'This is a fine theory and perhaps makes sense; but I want much more to go on than the name [Paktyikê standing for Paktyes]; I want more proof.'

³ See III. iii. 400-1. In the writer's belief, all the Nomad hordes who had ever invaded South-West Asia had always come through this gap and had never come over or round the Caucasus. He would not, of course, deny that, at times, Nomad peoples in occupation of the Volga-Don steppe had made raids round the eastern end of the Caucasus Range into the Kur-Aras Basin and beyond, but he would deny that this route had ever given passage to permanent migrants. Herodotus's statement, in Book I, chaps. 103-4, that this was the route by which the Cimmerians, with the Scyths at their heels, had broken into South-West Asia (at the turn of the eighth and seventh centuries B.C.) was, in the writer's judgement, not derived from any authentic record of the event, but was merely an inference from the fact that, in Herodotus's day, the only extant Scyths known to Herodotus were domiciled in the Great Western Bay of the Eurasian Steppe. Herodotus was transporting his Scyths from there to Media by, not the shortest, but the shortest practicable, route; but his premiss that the Scyths living in his day on the Black Sea Steppe must have been the Scyths who had invaded South-West Asia two or three centuries earlier was, in the present writer's opinion, erroneous. It was, surely, more likely that, when the Scyths had erupted out of the Central Asian heart of the Eurasian Steppe,

surprising to find Eastern Anatolia subsequently occupied by one wing of a horde whose other wing had occupied Eastern Iran; for, throughout the four thousand years or so of Eurasian Nomad history, each successive wave that broke upon the northern escarpment of the Iranian Plateau tended to split into divergent streams following diverse lines of least resistance. While the left wing of a horde that had mounted the plateau would be inclined to head south-eastward for the plains of the Indus Basin, the right wing of the same horde would be inclined to sweep on westwards, along the corridor between the southern foot of the Elburz Range and the northern edge of the Central Desert of Iran, till it arrived at congenial pasture-lands in the basin of Lake Urmīyah and, beyond that, in the steppe country in the lower basin of the rivers Aras and Kur, adjoining the west coast of the Caspian Sea. From these temporary camping grounds a subsequent horde, following at the first horde's heels, might then drive these forerunners of theirs on again up the Aras Valley, either to entangle themselves in the mountain maze overhanging the south-east corner of the Black Sea¹ or, if they were more fortunate, to travel on still farther westward over the watershed between the basins of the Aras and the Qyzyl Irmağ (Halys) until eventually they debouched into the Anatolian Peninsula. This had been the story of the Sanskrit-speaking Nomad invaders of South-Western Asia in the eighteenth or seventeenth century B.C. whose left wing had descended upon the Indus Basin while their right wing had made its appearance in Azerbaijan, Mesopotamia, North Syria, Transcaucasia, and Anatolia under the name Mitanni and perhaps also as the 'mariannu'.² In a subsequent invasion of South-West Asia by Iranian-speaking peoples which had brought the Medes and Persians into Iran, the deployment of the invading war-bands had been remarkably symmetrical.

In this invasion—as its course can be reconstructed by inference from the eventual locations of the participants after they had come to rest—the Persians must have been in the van—in an *échelon* in which the Yautiyā and the Mačiyā formed the advance guard and the Pārsā proper the main body, with the Asagartiyā bringing up the rear—while the Medes, following close behind, must have split the Persian vanguard into a right wing, which was pushed by Median pressure north-west-

they had been split (as in the eleventh century of the Christian Era the Turks, and in the thirteenth century the Mongols, were to be split) by the Caspian Sea into two wings, one of which had made its way between the Caspian and the Pamirs into South-West Asia and India, while the other had made its way between the Caspian and the Urals into the Great Western Bay of the Steppe to the north of the Black Sea.

Professor Cameron queries: 'What drove the Hurri into Mesopotamia [in the seventeenth century B.C.] and later brought Urartu into increasingly bloody contact with Assyria? Must it not have been the pressure of new peoples from across the Caucasus?' The present writer sees no need for this hypothesis. Nomad invaders breaking in via the Caspian Gates and/or non-Nomadic Caucasian highlanders could surely have supplied the driving force, without its being necessary also to postulate a Nomad invasion via Derbend.

¹ In this mountain bunker, lost tribes whose names—Māres, Sannoi, Skythēnoi (Xenophon, *op. cit.*, Book IV, chap. vii, § 18, and chap. viii), Sakasēnoi, Taokhoi (*ibid.*, chap. iv, § 18; chap. vi, § 5; chap. vii, §§ 1-14), Sirakes—revealed their provenance from the Eurasian Steppe, rubbed shoulders with others whose names showed that they had found their way into the same blind alley out of Anatolia. This was, for example, the provenance of the Tībarēnoi (from Tabal) and of the Moskhoi (from Phrygia and, before that, from South-Eastern Europe).

² See the Note on Chronology in x. 199-202.

wards, and a left wing which the same Median pressure pushed away towards the south-east. When, in and after the ninth century B.C., first the Assyrian and then the Achæmenian records progressively bring to light the positions in which the divers participants in this Iranian Völkerwanderung had established themselves, we find the Medes in the centre, astride the Great North-East Road leading up from Babylonia on to the Iranian Plateau via Behistan, with the Yautiyā and the Mačiyā at the outer extremity of either flank, the Pārsā between the Yautiyā and the Medes, and the Asagartiyā immediately to the rear of the Pārsā. On the south-east flank the Yautiyā are in North-Eastern Lāristān, the Mačiyā in South-Western Lāristān, the Pārsā in Fars and in Lūristān (Parsuwaš), and the Asagartiyā in Kirmān. On the north-west flank, the right-wing fraction of the Yautiyā can be detected in the latter-day Armenian name Uti (*Graecè* Utênē),¹ which attached to a district between the Qārabāgh and the south bank of the River Kur in Transcaucasia. The right-wing fraction of the Mačiyā (*Graecè* Mykoi) can be detected in the name Mūqān, Mughkān, or Mūghān² which attached to the patch of steppe to the south of the confluence of the rivers Aras and Kur. The right-wing fraction of the Pārsā turn up in Parsua, which was the Assyrian name for a canton in the North-Western Zagros, somewhere to the south-south-east of the basin of Lake Urmīyah,³ while the right-wing fraction of the Asagartiyā (*Assyriacè* Zikirtu) is located in the Assyrian records somewhere to the east or south-east of Lake Urmīyah.

This bifurcation into a westward-riding and a south-eastward-riding column was likewise to be the history of the Turkish-speaking Nomads who were to break upon the Iranian Plateau in the eleventh century of the Christian Era.⁴ It would have been strange if the wave of Iranian-

¹ See Adontz, N.: *Histoire d'Arménie, Les Origines* (Paris 1946, Union Générale Arménienne de Bienfaisance), p. 308. In Strabo: *Geographica*, Book XI, chap. vii, § 1 (C 508) and § 8 (C 514), these north-western Yautiyā are called Ouitioi.

² See Le Strange, G.: *The Lands of the Eastern Caliphate* (Cambridge 1905, University Press), pp. 175-6.

³ The evidence for the existence of this north-western Parsua, and for its location somewhere to the north of the Upper Zab [? i.e. the upper course of the Lesser Zab] is set out by Sidney Smith in *Isaiah, Chapters XL-LV, Literary Criticism and History* (London 1944, Milford), pp. 119-20 (notes 24 and 25, referring to p. 28). See also Forrer, op. cit., pp. 89-90, and Adontz, op. cit., pp. 100-3 and 366-9. The name of this Parsua, like the name Madai (Māda, Media), first occurs in the annals of Shalmaneser III. According to König, F. W.: *Altteste Geschichte der Meder und Perser* (Leipzig 1934, Hinrichs), p. 8, Parsua is first heard of in 844 B.C., Madai in 836 B.C. Cp. Cameron, G. G.: *A History of Early Iran* (Chicago 1936, University of Chicago Press), pp. 143-4.

⁴ This instance is also a reminder of the fact (noticed on p. 606, n. 3, above) that the frontier of the Eurasian Steppe between the Pamir Plateau and the south-east corner of the Caspian Sea was not the only sector on which an erupting horde of Eurasian Nomads was apt to fan out in diverse directions in the course of its farther advance. In and after the eleventh century of the Christian Era the fanning out, as far afield as India on the left and Anatolia on the right, of the Turks who had crossed the frontier between the Pamirs and the Caspian was matched by a corresponding dispersion of their brethren who had simultaneously broken out of the heart of the Steppe into its Great Western Bay through the gap between the Caspian and the Urals. Some of these Turkish-speaking invaders of the Western Bay moved north-westward up the Volga towards Great Bulgaria (Qāzān); others moved south-westward into the Kuban; while others, advancing due westward, crossed first the Don and eventually the Carpathians, when a remnant of the Ghuzz (*alias* Cumans) found asylum on the Hungarian Alföld from the pursuing Mongols (see XIII. x. 54-55).

A simultaneous eruption north and south of the Caspian Sea was, indeed, normal.

speaking Nomads—this time Saparda, Cimmerians, Scyths, Paktyes, and Kaspioi (*Latine Caspii*)—who broke upon the same plateau out of the same steppe in the eighth and seventh centuries B.C., had not splayed apart in the same two divergent directions; and the word 'Paktyikê' in Herodotus's description of District No. 13 in his gazetteer is not the only piece of evidence that points to this conclusion. The tribal name of a detachment of the Paktyes established in Anatolia may also perhaps be detected in the place-names Paktyê, borne by a town at the neck of the Gallipoli Peninsula before the end of the sixth century B.C.,¹ and Paktyês, borne by a mountain near Ephesus,² and likewise in the personal name 'Paktyas' which, in Herodotus's history,³ is borne by a Lydian whom Cyrus put in charge of Croesus's captured treasure, and who took this opportunity to place himself at the head of a Lydian insurrection against Achaemenian rule. It is also worth noticing that the Kaspioi, whom Herodotus locates in the corridor leading out of Khurāsān into Azerbaijan, as one of the peoples in his District No. 11, and in the lower basin of the rivers Aras and Kur, as one of the peoples in his District No. 15, appear in his field-state of Xerxes' expeditionary force in an association which suggests that there must have been another detachment of Kaspioi who, like the other wing of the Paktyes, were established somewhere in Eastern Iran.⁴

On this line of reasoning, we may interpret the 'Paktyikê' in Herodotus's description of District No. 13 of his gazetteer as standing for Paktyes who were not the well-known bearers of the name in Eastern Iran, where it had survived down to the twentieth century of the Christian Era in the form Pakhtūn-Pakhtāna. The Paktyes whom Herodotus had found associated with the Armenians would not be these

In the fifth century of the Christian Era, for example, the Huns were invading the Indian and the European peninsula of Asia at the same moment, while in the seventh century B.C. the westward advance of detachments of Cimmerians and Scyths south of the Caspian into Anatolia was accompanied by a simultaneous westward advance of other detachments of the same two peoples north of the Caspian into the Great Western Bay of the Eurasian Steppe (where the passage of a band of Cimmerians, in advance of a pursuing band of Scyths, was attested by the name 'Cimmerian Bosphorus' by which the Straits of Kerch were known in Hellenic parlance).

It will be evident that, when a Nomad horde thus erupted north and south of the Caspian Sea simultaneously, and then fanned out both in the Great Western Bay of the Steppe and in South-West Asia, its extreme right and left wings might eventually come to rest at an enormous distance apart. On the map of the Old World in the twentieth century of the Christian Era, for example, the fanning out of the Bashkirds was commemorated by the survival of their name both in the Southern Urals and in South-Western Baluchistan; and in the light of this latter-day parallel it is not surprising to find the Boudinoi, whom Herodotus (Book IV, chaps. 21 and 108) locates within the timbered country north of the steppes east of the River Don (locates, that is, somewhere in the neighbourhood of Bashkiristan), also figuring (in Book I, chap. 101) as one of the tribes of the Medes under the name Boudioi, or again to find established on the banks of the River Kuban the right wing of the Sindoi whose left wing stamped this originally Eurasian Nomad people's name first on the River Indus and eventually on the whole Indian sub-continent.

¹ See Herodotus, Book VI, chap. 36.

² See Strabo: *Geographica*, Book XIV, chap. i, § 13 (C 636), and chap. i, § 39 (C 647).

³ Book I, chaps. 153-6.

⁴ This eastern wing of the Kaspioi is mentioned in Book VII, chapter 67, between the Gandaro-Dadican brigade on the one side and the Sarangian (*Persicê Zrāka*) contingent on the other side. The Persian commanders of the Gandaro-Dadican brigade and of the Caspian contingent are brothers. These Eastern Kaspioi, like the Eastern Paktyes, are described in this context as wearing *sisyrnai* (sheepskin coats). See pp. 635-6, below.

Pactyan denizens of Harahvatiš, to whom Herodotus had allotted both his District No. 13 under their own name and his District No. 14 under the descriptive title 'borderers' (Thamanaioi); the Armenians' Pactyan associates would be a western branch of the Pactyan horde who had established themselves in Eastern Anatolia and who must have been associated with, if not identical with, the intrusive Nomad occupants of the same territory who bore the name Cimmerians'.¹ The Greek adjectival form 'Paktyiké' would be an Hellenic man of letters' rationalization of a plural form of the substantive 'Pakty-' taking the non-Indo-European plural ending in 'k' which was endemic in the region between the Caucasus and Mesopotamia;² and this plural 'Paktuk' would reappear in the second and third syllables of the name 'Katpatuka' which, like the name 'Armina', makes its first appearance in history in the Achaemenian lists of *dahyāva*. 'Katpatuka' would signify 'the Paktyes domiciled in Khatti', as distinguished from their brethren and homonyms who were domiciled in the South-East Iranian *dahyāuš* known as Harahvatiš.

If Cappadocia and the peoples along the north coast of Anatolia between Cappadocia and Colchis, exclusive of Colchis itself, had in truth been thus associated with Nāiri-Armina in a single vicerealty

¹ A remnant of the Cimmerians who had swept westwards as far as the west coast of Anatolia in the seventh century B.C. appears to have survived in Cappadocia, to judge by the fact that the name by which Cappadocia was subsequently known in the Armenian language was Gamir (see Prášek, J. V.: *Geschichte der Meder und Perser* (Gotha 1906, Perthes, 2 vols.), vol. i, p. 148).

² The acquisition of a plural ending in 'k' was one of the penalties entailed in settling within this area. This fate overtook the Armenian language and, among other substantives in it, the Armenians' own name for themselves; for 'Haik', as the Armenians called themselves, is the plural of a singular form 'Hay' which would appear to denote an inhabitant of the country, occupying the north-west corner of the Euphrates Basin, which the Hittites had once known as 'Hayasa' and which the Hellenic geographers were later to know as 'Armenia Minor'. Gurdi's war-band, likewise, became known (if there is any substance in our conjecture on p. 604, above) as 'Gordi-k' (*Graecé* Kardoukhoi) in the mountain bunker between the Rivers Bohtān (*Latine* Centrites) and Tigris which brought their south-eastward *trek* to a halt and which came to be known, after them, as 'Gordiyēnē'. The Taokhoi whom Xenophon and his comrades encountered in the highlands in the hinterland of the south-eastern corner of the Black Sea were perhaps a lost tribe of Transcaspian Nomad Dahā who had acquired the same inevitable plural in 'k' after finding their way into this 'living museum' in which so many splinters of broken peoples silted up (though there was also a cape and a town called Taokhē and a canton called Taokhēnē outside the 'k' area, along the coast of Fars (see Strabo: *Geographica*, Book XV, chap. iii, § 3 (C 728), and Ptolemy: *Geographia*, Book VI, chap. iv, §§ 2, 3, and 7)).

The Saparda, who had headed the Eurasian Nomads' seventh-century ride into Anatolia, in the van of the column in which the Paktyes, Cimmerians, Scyths, and Kaspioi followed behind them in échelon, reappeared as Sevordi-k some fourteen centuries later, when *circa* A.D. 750–60 they sacked an outpost which had been established at Bardha'ah by the Arab Muslim conquerors of the Sasanian Empire. The historical evidence bearing on this incident is discussed in Marquart, J.: *Osteuropäische und Ostasiatische Streifzüge* (Leipzig 1903, Dieterich), pp. 36–40, and in Macartney, C. A.: *The Magyars in the Ninth Century* (Cambridge 1930, University Press), pp. 87–90 and 174–6. These Modern Western students of the origins of the Magyars had been led astray by the Byzantine scholar-emperor Constantine Porphyrogenitus's erroneous assertion that these survivors of the Saparda who had invaded South-West Asia in the seventh century B.C. were a detachment of the Magyar horde. The form in which Constantine presents the Saparda's name—Σάπαροι ἀσφαλοι—is manifestly a transliteration of an Arabic original 'Sāwardiyah al-asfal', 'the lowland Sāwardiyah' in the plain between the Qārabāgh and the River Kur, as contrasted with 'the highland Sāwardiyah' somewhere else. Mas'ūdi's and Istakhri's description of these descendants of the Saparda as being 'a kind of Armenian' is not so wide of the mark as Constantine's blunder.

by the policy of Cyaxares and Cyrus II, it would follow that Persia and Media were not the only political divisions of the Achaemenian Empire that Darius partitioned in his new fiscal map. Besides dividing Persia into two fragments, one of them now officially tax-paying and the other still nominally exempt, and Media into four fragments, Darius will also have divided Armenia into three by erecting the peoples between the northern boundary of Armenia Proper and the Black Sea coast of Anatolia into a separate taxation district, duly reported by Herodotus as his District No. 19, and by detaching Cappadocia from Armenia, at any rate for fiscal purposes, to constitute a taxation district—Herodotus's District No. 3—in which we find Cappadocia brigaded with a province, administered from Dascylium near the Anatolian coast of the Sea of Marmara, which had already been detached politically from Lydia.¹

We are now perhaps in a position to take the full measure of the grievous change for the worse in the domestic life of the Achaemenian Empire which was the nemesis of Darius's assassination of the reigning emperor and usurpation of the Imperial Crown. Under the Cyran branch of the House of Achaemenes, as under the foregoing Median dynasty, the Empire had (if we have been right in our reconstruction of its history) been securely grounded on the paramountcy of a broad association of imperial peoples—the Medes, the Persians, the Armenians, and eventually also the Bactrians—who were bound to one another by their common enjoyment of a privileged status and their common loyalty to a dynasty by whose generosity this status had been conferred upon them.² A sadly different picture is presented in Herodotus's gazetteer of Darius's taxation districts; for, in spite of the errors and confusions, here and there, that we have been attempting to clear up, Herodotus's gazetteer does bring to light something that none of the six official lists of *dahyāva* betray. As a result of the revolts against Darius's assumption of the Imperial Crown which had broken out in 622 B.C. among the privileged paramount peoples of the Empire as well as among the subject peoples, Darius had found himself constrained to reduce to a dangerously narrow compass the once broad basis of voluntary support on which Cyaxares' and Cyrus II's régime had safely rested. Of the four former imperial peoples, the Bactrians alone had retained their previous position intact. The Persians had been partitioned most invidiously into a still privileged remnant of loyalists in Fars and a batch of dissident communities—the Yautiyā and Mačiyā in Lāristān and the South-Eastern Asagartiyā in Kirmān—who had been degraded to the ranks of their own former subjects. Media had been partitioned, for fiscal purposes, into four fragments—in addition to the

¹ This separate province, known in Hellenic parlance as 'Hellespontine Phrygia', must have been detached politically from Lydia already before the date of Darius's division of the Achaemenian Empire into taxation districts, since Herodotus testifies to its separate existence on the political map, not only in the first decade of the fifth century B.C., at the time of the Ionian Revolt (see Book VI, chap. 33), but already as early as the reign of Cambyses, when the governor of Dascylium, Mitribates, was at loggerheads with the viceroy of Sardis, Oroëtes, who had been Cyrus's appointee (see Book III, chaps. 120 and 126, and the present Annex, p. 671, below).

² On this point, see Herzfeld, *op. cit.*, pp. 117-18.

deportation of the *déracinés* who had been marooned on the islands in the Persian Gulf. Armenia had been partitioned for fiscal purposes into three fragments.

No doubt Darius felt rueful about having to take these precautionary measures. They were a poor substitute for the goodwill that the House of Achaemenes had forfeited in consequence of the extinction of the Cyran branch and the transfer of the crown to the Ariaramnan branch through the assassination of a reigning emperor who had professed himself to be Cyrus's authentic son and Cambyses' legitimate successor. We know that Darius did his utmost retrospectively to justify his acts and to regularize his position. He published his own account of the obscure and controversial events of the year 522-521 B.C. on the cliff-face at Behistan in the three languages of the imperial capitals,¹ and arranged for the distribution of an Aramaic translation of the text, in a portable form, throughout his dominions.² He married two of Cyrus's daughters and one of his granddaughters whose father had admittedly been the genuine Smerdis,³ whether the Smerdis whom Darius had assassinated had been the murderer's subsequent wife's father or an impostor. He also, as his inscriptions and bas-reliefs record, took care to employ Medes as well as Persians in posts of high confidence and responsibility.⁴ In the light of these recorded evidences of Darius's general policy, we could have guessed—even without the help of the direct evidence that we have gleaned from Herodotus—that, in taking his precautions to make it impossible for an integral Persia, integral Media, and integral Armenia ever again to be carried away by an anti-Ariaramnan national movement, as each of these three great sub-empires had been carried away in 522-521 B.C., Darius would have taken pains to avoid any unnecessary provocation.

The straightforward way of guarding against the danger in Media and Armenia would have been simply to abolish the two sub-empires and to break each of them up into a number of smaller viceroyalties; but, as we have seen,⁵ there are indications in Herodotus's work that, on the post-Darian map of the Achaemenian Empire, an integral viceroyalty of Media and an integral viceroyalty of Armenia still survived side by side with the smaller districts into which either of them had been dissected by Darius for fiscal purposes. This coexistence of an old political with a new fiscal map was revealed to us by an examination of inconsistencies in the Herodotean gazetteer which we traced back to a confusion in certain places between the two coexistent maps; and

¹ See V. v. 499, n. 3.

² 'By the favour of Ahuramazda this inscription in other ways I made. In addition, it was in Aryan, and has been made on leather. . . . Afterwards this inscription was sent by me everywhere among the provinces; the people universally were pleased' ('DB', § 70, Professor R. G. Kent's translation in *Old Persian*, p. 132).

A well-thumbed fragment of the Aramaic translation had been retrieved by Modern Western archaeologists from the débris of the loyal Jewish military cantonment at Elephantine (see Hoonacker, A. van: *Une Communauté judéo-Araméenne d'Éléphantine, en Égypte, aux vi^e et v^e siècles av. J.-C.* (London 1915, Milford), p. 32).

⁴ See Junge, P. J.: *Dareios I* (Leipzig 1944, Harrassowitz), pp. 129-30, with n. 13 to chap. 5.

⁵ On pp. 603-11, above.

the official preservation of Cyaxares' and Cyrus II's sacrosanct sub-empires is indeed what we should have expected *a priori*, for an official abolition of them would have been flagrantly impolitic. Besides keeping open the wounds unavoidably inflicted on the pride of high-spirited imperial peoples who had constrained Darius to subdue them by force of arms in 522-521 B.C., so drastic a precautionary measure as this would have advertised Darius's lack of confidence in the finality of a victory which had indeed been glorious just because it had been so hardly won. We shall therefore not be surprised to find that Darius officially respected the integrity of the Cyran viceroyalties, but at the same time we must not allow ourselves to be hoodwinked by Darius into imagining that the power of the dangerous viceroyalties was not broken in fact as a result of the partitioning of these particular viceroyalties into a larger number of smaller districts on Darius's new fiscal map.

Darius was not named 'the huckster'¹ for nothing, and his precocious appreciation of the potency of economics and finance in public affairs gave him the cue for solving his political problem of taking precautions without giving provocation by attracting attention to what he was actually doing. Darius was aware of the power of the purse; and he will have perceived that a viceroy—or some insurgent nationalist leader who might have disposed of a viceroy as Darius himself had disposed of Smerdis—would not find it easy to try conclusions with the Imperial Government when the control of revenue within his viceregal boundaries had been transferred from him to several district intendants of finance, each separately and directly responsible to the Imperial Chancery. Of course, in an empire in which most of the provinces were economically backward, and in which a money economy was still in its infancy, the power of the purse was modest if measured by twentieth-century Western standards; yet, combined with the weapon of secret intelligence, which the Central Government will have also acquired by setting up a new financial administrative network independent of the existing political administrative network, the separation of political and fiscal powers would greatly reduce a viceroy's capacity for making mischief. Darius must have perceived that his new network of taxation districts, operating unobtrusively behind the façade of an old network of viceroyalties, would be, *de facto*, the effective engine of imperial administration in a huckster-emperor's hands.

The local variations in the relation of the new fiscal map to the old political map are significant. The policy of breaking up, on the fiscal map, viceroyalties that were politically dangerous was applied, as we shall see, not only to Media and Armenia, but also to 'Babylon-cum-Beyond the River' ('Pahat Babili u Ebir-Nari'),² which was partitioned into the two taxation districts Bābiruš and Athurā, and to West Anatolia,

¹ 'Darius's assessment of tribute and other similar measures of his provoked the Persians into coining the *mot* that Darius was a huckster, Cambyses a despot and Cyrus a father—in allusion to Darius's vice of dealing in a huckster's spirit with all affairs of state, to Cambyses' vices of irritability and contemptuousness, and to Cyrus's virtue of gentleness and to the consequently invariable beneficence of his acts' (Herodotus, Book III, chap. 89).

² See Professor G. G. Cameron's observation quoted on p. 657, n. 3, below.

which was partitioned into the two taxation districts Sparda and Yauna, though in either of these two cases, likewise, the political viceroyalty appears to have been kept intact.¹ By contrast, the loyal Viceroyalty of Harahvatiš was enlarged politically by the addition of Zrāka,² and was still further enlarged on the fiscal map by the attachment to it, for taxing purposes, of the disaffected Persian cantons Asagarta, Yautiyā, and Maka, in Kirmān and Lāristān, to constitute the Herodotean Taxation District No. 14.³ The loyal Viceroyalty of Bākhtriš, again, seems to have been left intact not only on the political map but also on the fiscal map, where it constituted the Herodotean Taxation District No. 12.⁴

It will be seen that Darius's policy was as adroit as any policy could be in the adverse circumstances with which the Ariaramnan usurper had condemned himself to have to contend; yet a sovereign who has acquired the nickname 'huckster' stands convicted of not being loved; and, for all that Darius could do, it was beyond his power, and beyond his successors' power, to put the Achaemenian Empire back on to the broader basis of consent and support on which it had rested in the auspicious Cyran initial chapter of its history. When Darius and Xerxes then proceeded to strain the weakened structure of their régime by embarking on an ambitious forward policy of incorporating the remainder of the Hellenic World, together with its Nomad hinterland on the Great Western Bay of the Eurasian Steppe, it is no wonder that they should have run into a catastrophe.

The Ambiguity of Homonyms

The foregoing general account of the administrative geography of the Achaemenian Empire must now be supplemented by some consideration of the evidence—partly anticipated in the preceding discussion—which was at the disposal of twentieth-century Western scholars seeking to identify and locate particular countries and peoples named in the extant sources of information, both official and Herodotean. One of the difficulties that beset an investigator in this field was the frequent occurrence of an identical name in more than one place on the map, and it may therefore be useful to face this fertile source of confusion before plunging into details.

The occurrence of these homonyms was confusing in two ways. In the first place it was apt to leave the investigator in doubt as to whether he was confronted with a single people or with two or more distinct and separate peoples bearing such-and-such a name. Cases in point were the uncertainty about the existence of a north-western detachment of Paktyes in Cappadocia (Katpatuka)⁵ and of a south-eastern detachment of Kaspioi in Arachosia (Harahvatiš) or thereabouts.⁶ In the second place it was not always possible, even where the recurrence of a name was not in doubt, to be sure that the recurrence was anything more than

¹ See pp. 657 and 678, below.

² See p. 589, with n. 3, above, and p. 637, below.

³ See pp. 622 and 637, below.

⁵ See pp. 608–10, above.

⁴ See p. 644, below.

⁶ See p. 609, above, and pp. 635–6, below.

a coincidence that was a phonetic accident of no historical significance.¹ In the third place, even if it could be demonstrated—or at least be shown to be probable—that the homonyms really were recurrences of the same name in the same language, it was not always possible to determine the recurrent name's character. On the one hand it might be a genuinely proper name, whose occurrence in different places was evidence that the two or more peoples bearing it were akin to one another and that they had reached their eventual locations from some common original centre of dispersion, however remote from one another might be the regions in which they had respectively come to rest at the end of their divergent migrations. A number of apparent examples of the fission and fanning out of Eurasian Nomad peoples in the course of their eruption out of the Steppe into the regions round about have come to our notice already in our discussion of the geographical distribution of the Paktyes.² We have, however, also already come across names that are manifestly not proper names but are descriptive epithets or labels which bear their meaning on their face and which in some cases are known to have been current side by side with genuine proper names which they had not driven out of currency. A classic example is the multiple nomenclature of one branch of the people whose proper name was Paktyes.³ The south-eastern Paktyes lived, as we know, in a country that bore the proper name Harahvatiš (*Latinè* Arachosia) in virtue of being situated in the basin of a river which in the *Avesta* is called the Harahvaiti.⁴ This *dahyāuš* is called exclusively by the name of the country in the official lists, and this place-name Harahvatiš (*ethnikon* Harahvatiyā) is duly reproduced in the Hellenized form 'Arakhōsia' (*ethnikon* Arakhōtoi) in the works of post-Herodotean Hellenic geographers. In Herodotus's work, on the other hand, the name 'Arakhosia' never occurs. In his field-state of Xerxes' expeditionary force, Herodotus calls the people of Arachosia by their national name 'Paktyes',⁵ while in his gazetteer of Darius's taxation districts he calls them by their descriptive label 'thamanaioi', meaning 'borderers'.⁶

It is evident that the same title 'borderers' might have been conferred by the Achaemenian authorities, whether officially or informally, on half a dozen different peoples who would have had nothing in common with one another beyond their geographical location on one or other of

¹ In a cautionary comment, Professor G. G. Cameron recommends a prudent adherence to the hypothesis of a non-significant coincidence unless and until convincing evidence in favour of some other explanation presents itself. 'I feel', he writes, 'that there are passages in which you have leaned too heavily on homonyms. I believe, for example, that many town names go back to such primordial times that any attempt to deduce tribal, ethnic, or linguistic conclusions is hopeless. I am innately suspicious of such things. We thought, for example, that Arbela meant "the Four God City", and so it could have been interpreted in Semitic; but now earlier documents present us with Urbillum, which is by no means so explainable. The name, consequently, is pre-Semitic.' After receiving this wise and kindly caution, the writer of this Annex could not plead that he had not been warned.

⁶ See Herodotus, Book III, chap. 93

the Achaemenian Empire's far-flung frontiers; and in this case an identical label would have been presumptive evidence, not that the peoples bearing it were akin, but, on the contrary, that they had nothing to do with one another. On a latter-day map of Iran and the regions round about, there were, as we have already noticed,¹ at least two 'dāmāns': one between the eastern escarpment of the Iranian Plateau and the west bank of the Indus, and the other at the southern approaches to the Hindu Kush in the basin of the Kābul River; and there was evidently no reason to suppose that there was any national affinity between these eastern and northern borderers of an Afghan Empire. In the administrative geography of the Achaemenian Empire the only borderers labelled, in the extant sources, with the word 'dāmān' were the Paktyes of Arachosia; but there was another word signifying 'border' in the Old Persian language which did occur in at least four places on the Achaemenian and Hellenic map of Iran, and this was 'paraitaka'.

One such 'paraitaka' was the first district of Media which Alexander found on his path in his twelve days' march in the spring of 330 B.C. from his winter-quarters in Persis (Pārsa, Fars) to Ecbatana (Hamadān),² and these indications locate this 'paraitaka' in the latter-day province of Ispahan.³ This was evidently the border province of Media over against Persis, and that will have been the country of the Parētakēnoi who are cited by Herodotus in his list⁴ of the tribes of the Medes. This 'paraitaka' between Media and Persis may also be the Partakka or the Partukka mentioned in the Assyrian King Esarhaddon's record of the Assyrian cavalry's operations on the Iranian Plateau, between the Zagros and the Central Desert, in 673 B.C.,⁵ since on the same expedition the Assyrians also raided a country called Patush Arri, and this name is evidently identical with the name of the Pateiskhoreis who were one of the tribes of the Persians according to Strabo.⁶ There was, however, another Median 'paraitaka', known to post-Herodotean Hellenic geographers and likewise included in Media by them,⁷ though not mentioned by Herodotus,⁸ near the intersection of the Great North-West Road and the Great

¹ On p. 594, n. 1, above.

² See Arrian: *Expediitō Alexandri*, Book III, chap. xix, § 2.

³ For this 'paraitaka' at the south-eastern extremity of Media, see further Strabo: *Geographica*, Book II, chap. i, § 26 (C 80); Book XI, chap. xiii, § 6 (C 524); Book XV, chap. ii, § 8 (C 723) and § 14 (C 726); chap. iii, § 6 (C 729); Book XVI, chap. i, § 17 (C 744).

⁴ See Herodotus, Book I, chap. 101.

⁵ See Cameron, G. G.: *A History of Early Iran* (Chicago 1936, University of Chicago Press), pp. 172-4. In spite of the similarity of their names, these two districts are not identical, since they are mentioned side by side (see Luckenbill, D. D.: *Ancient Records of Assyria and Babylonia* (Chicago 1926-7, University of Chicago Press, 2 vols.), vol. ii, pp. 519, 540, 566).

⁶ See Strabo: *Geographica*, Book XV, chap. iii, § 1 (C 727), cited by Cameron, *ibid.* Esarhaddon's record runs: 'Patush Arra, a district on the border of the salt desert, which lies in the land of the distant Medes, on the edge of Mount Bikni, the lapis lazuli mountain, the soil of whose land not one among the kings my fathers had trodden' (Luckenbill, *op. cit.*, vol. ii, pp. 519, 540, [560], 567).

⁷ See, for example, Strabo: *Geographica*, Book XI, chap. xii, § 4 (C 522); Book XV, chap. iii, § 12 (C 732); Book XVI, chap. i, § 2 (C 736) and § 8 (C 739).

⁸ Herodotus's Parētakēnoi cannot have been the inhabitants of this western 'paraitaka', considering that, in his itinerary of the Achaemenian Empire's Great North-West Road in Book V, chaps. 49-54, Herodotus does not assign to Media any of the territory through which this road ran. According to the passage in Book V, chaps. 52-53, the road ran from 'Armenia' through 'Matiēnē' into 'Kissia' (see pp. 629-30, below).

North-East Road.¹ There was a third 'paraitaka' on one of the borders of Sogdiana which cannot be located exactly from Arrian's narrative² of Alexander's operations there, and there was a fourth—the latter-day Sakastênê (Seistan)—astride the lower course of the River Hilmand between Zarangianê (Zrāka) and Arachosia (Harahvatiš).³

Obviously there was no more affinity between the inhabitants of these four 'paraitakas' in an Achaemenian Iran than there was in a Medieval Western Christendom between the inhabitants of the March of Ancona, the March of Brandenburg, Denmark, and Finmark, or between the inhabitants of the County Palatine of Durham, the quarter known as the Pallant within the walls of the city of Chichester, a Kur Pfalz astride the Rhine and an Ober Pfalz at the northern tip of Bavaria.

While 'borderers'—denoted by the synonyms 'parêtakênôî' and 'thamanaioi'—is one of the descriptive labels on the map of the Achaemenian Empire, another is 'pairikās', meaning people practising an objectionably distinctive religion. We have observed already⁴ that this name, *Graecè* 'parikanioi', was one of several descriptive titles of an Iranian-speaking Nomad people, marching with Sogdiana in the upper valley of the Jaxartes (Sir Darya), whose national name had not been preserved. The Achaemenian imperial authorities, who had originally confounded this people with a host of others of their kind under the generic title 'Sakā' signifying 'Eurasian Nomads', appeared to have subsequently distinguished them from other Nomads by calling them alternatively 'Hauma-(?)drinking Sakā' ('Sakā Haumavargā'), in allusion to one of their religious rites, and 'the Allies' (the Herodotean 'Aiglai'), in allusion to their exceptionally favourable juridical relation with the Achaemenian Empire. But this particular people had no monopoly of being in a treaty relation with the Achaemenian Imperial Government or of drinking hauma or, again, of practising an objectionable religion;⁵ and accordingly, when we find another people labelled 'parikanioi' in Herodotus's gazetteer, we cannot infer from the common name that these two peoples had anything in common beyond their common failure to win approval for their respective religions, whatever these may have been. This common label 'pairikās', rendered 'parikanioi' in Greek, was undoubtedly affixed to each of the two peoples to whom Herodotus applies it; for in A.D. 1952 the upper basin of the Sir Darya, which had once been the habitat of 'the Hauma-(?)drinking Sakā', still bore the name 'Fārghānah', while the name of a place called Fārghān, 60 kilometres to the east of Tārum and 120 kilometres to the north of Bandar 'Abbās,⁶ together with the name of the neighbouring Mount Furghun, attested the former presence of people labelled 'parikan' just

¹ See p. 210, n. 3, above.

³ See Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 95, following Isidore of Charax: *Parthian Stations*, chap. 18.

⁴ On pp. 594–5, above.

⁵ For example, the Hellenes who burned their fathers' corpses and the Callatian Indians who ate their fathers' corpses (see Herodotus, Book III, chap. 38) were, no doubt, both alike stigmatized as 'pairikās' by devout Zoroastrian Persians who exposed their fathers' corpses to be devoured by carrion-eating birds and beasts.

⁶ See Herzfeld, *op. cit.*, p. 83.

where we should expect to find 'parikanioi' whom Herodotus presents in his gazetteer as yoke-fellows of the Asiatic Ethiopians in Darius's eighteenth taxation district.¹

A third descriptive epithet that was rife in the Achaemenian Empire, side by side with 'heathens' and 'borderers', was 'highlanders'. 'Ākaufačiyā', which bears this meaning in Old Persian, figures as the name of the people of an Achaemenian *dahyāuš*;² and 'parvatā', which, like 'kaufa', was an Iranian word meaning 'mountain',³ appears in Greek dress in Herodotus's ethnicon 'Aparytai' and in Ptolemy's ethnika 'Parouētai' and 'Parautoi'.⁴ Did one of the pre-Indo-European languages current on the plateaux of Anatolia, Armenia, and Iran have a word meaning 'hill country' which generated the name 'Tabal' in Assyrian records of the ninth, eighth, and seventh centuries B.C.?⁵ In the Assyrian usage of this word there is an ambiguity; for, while it is used generically to signify the whole of the highlands of the Taurus and Antitaurus, it is also used specifically as the proper name for one particular principality in this region which bestrode the upper waters of the rivers of Cilicia in the country afterwards known to Hellenic geographers as Cataonia.⁶ This variety of usage leaves us in doubt as to whether the Tibarēnoi in the Herodotean Taxation District No. 19, towards the eastern end of the Black Sea coast of Anatolia, were just the local highlanders ('people of the tabal'), or whether 'Tibarēnoi', as applied to them, is a proper name which informs us that these were descendants of refugees from the East Central Anatolian principality of Tabal who had taken refuge in this north-eastern fastness from assaults by Moskhoi falling upon them from the west or by Saparda, Paktyes, Cimmerians, and Scyths falling upon them from the east, or both. Similarly we are left in doubt as to whether the Mount Tabor above the headwaters of the River Jordan was named after the Mount Atabyrios in Rhodes by Philistine settlers on the coast on which they stamped their own name; or whether the two mountains are both called 'tabal' simply because 'tabal' means 'mount'. However that may be, it is easier to believe that the 'highlanders' (*Graecè* 'Tapouroi'; *Arabice* 'Tabarī') who gave the name 'Tabaristan' to the country between the Elburz Range and the south coast of the Caspian Sea, bore the same name as the Tibarēnoi of Anatolia because both peoples happened to live in a hill country, than it is to believe that the identity between the two names is evidence that the two peoples had a common ancestry; and the wisest course here is no doubt the third alternative of refraining, in default of positive evidence, from seeing in the resemblance between the two names 'Tibarēnoi' and 'Tapouroi' anything more than an accidental coincidence.

There are at least three other cases in which corresponding doubts arise. Considering that the Iranian word 'dahā' (Sanskrit 'dasā') means 'brigand', how are we to know whether the 'dahā' (*Latine* Dahae, Davi),⁷

¹ See further p. 623, below.

² See p. 647, with n. 5, below.

³ Hence the 'Tubal' of Gen. x. 2.

⁴ See p. 668, below.

⁵ See p. 647, n. 6, below.

⁶ See Forrer, *op. cit.*, p. 73.

⁷ This ethnicon 'Davi' is implied in the personal name 'Dāvus', representing a Greek Dāos, which is borne by slaves in Latin translations of Attic comedies written in the third century B.C.

whom we find at divers points on our map bear an identical name in virtue of having a common ancestry, or whether they bear it merely as the stigma of a disreputable common profession? Again, considering that the word which appears in Hellenic dress as 'Amardos' or 'Mardos' seems to be merely a rendering of the Old Persian word 'martiya' meaning 'man', how are we to know whether the north-western neighbours of the Tapouroi in the Elburz Range who bore this name, and their homonyms in the North-Western Zagros (the latter-day Mardistan, east of Lake Van) and in Persis, were branches of a single people which had split, like its sister-peoples the Yautiyā, Mačiyā, Pārsā, and Asagartiyā,¹ in the course of travelling across the Iranian Plateau, or whether the only thing that the three bands of 'mardoi' had in common was that, in their common Iranian tongue, they had, all three, elected to style themselves 'the men' *par excellence* in allusion to their common pursuit of the same manly calling of robbery under arms?² In the third place we find ourselves at a loss to tell whether the Yaudheya whose habitat was in the borderland between the Panjab and Rājputāna were akin to the Yautiyā (Outioi) of Lāristān and to the Ouitioi of Transcaucasia, or whether the identity of these names tells us merely that the two peoples who bore them in India and in South-West Asia both took pleasure in calling themselves 'the warriors'.³

After this precautionary reconnaissance of some of the pitfalls graven across a scholar's path by the ambiguity of homonyms, we have now to hazard ourselves on this treacherous ground. The one slightly encouraging feature in a foolhardy enterprise is that there is manifestly some safety in numbers. Where we have only a single name to confront with a single name—for example 'Tapouroi' with 'Tibarēnoi'—the hypothesis of an accidental coincidence is, no doubt, our most prudent recourse. But, where we have a pair of names to confront with a corresponding pair—for example the Greek 'Tibarēnoi' plus 'Moskhoi' with the Assyrian 'Tabal' plus 'Mushki' (the Biblical 'Tubal' plus 'Mesech'), or, again, the Mount 'Tabor' plus River 'Jordan' of Palestine with the Mount 'Atabyrios' of Rhodes plus River 'Iardanos' of Crete—the hypothesis of sheer coincidence would seem less probable; and it would seem decidedly improbable where we have a four-in-hand on either side—as, for example, in the correspondence between the 'Yautiyā (Outioi)' plus 'Mačiyā (Mykoi)' plus 'Asagartiyā (Sagartioi)' plus 'Pārsā (Persai)' of South-Western Iran with the 'Ouitioi' plus 'Mūqān' plus 'Asagartiyā' plus 'Parsua' of North-Western Iran. In this last case, at any rate, we can confidently infer that our four associated pairs of homonyms are less likely to have been the product of Chance than to be the monument of an historical fission of each of four co-migrant peoples into two diverging wings.

¹ See pp. 607–8, above.

² This question is raised by Strabo in Book XI, chap. xiii, § 3 (C 523).

³ For the Yaudheya, see Rapson, E. J., in *The Cambridge History of India*, vol. i, p. 528, and de la Vallée Poussin, L.: *L'Inde aux Temps des Mauryas* (Paris 1930, Boccard), p. 16.

Notes on Names and their Locations

In the following discussion of outstanding questions of interpretation and identification, we shall follow the order in which the names of peoples and countries occurring in our sources have been entered in Table V, attached to this Annex, which folds out opposite p. 772. In each successive line we shall deal first with the Old Persian name in the left-hand column of the table, and shall then consider, in connexion with it, the Herodotean name or names that have been equated with it in the table, before proceeding to deal with the next Old Persian name in the left-hand column.

The *Pārsā* (*Graecè* Persai) who retained the status of a privileged imperial people in the Achaemenian Empire after its reorganization by Darius I were only a fraction of the Persian people. For one thing, they did not include the Nomad rearguard of the *Pārsā* who had become one of the tribes of the Achaemenian Empire's Central Asian Nomad subjects the Pointed-Hood Sakā (*alias* Massagetae); for these dilatory 'Parsiōi' did not mount the northern escarpment of the Iranian Plateau till *circa* 130 B.C.¹ Nor did Darius's *Pārsā* or Herodotus's Persai include the right wing of the *Pārsā*, known to the Assyrians as Parsua, which, in the course of the original Medo-Persian occupation of Western Iran, had settled, together with the right wings of the three companion peoples—Yautiyā, Mačiyā, Asagartiyā—in Ardalan, in Azerbaijan, and still farther north and north-west, in the lower basin of the rivers Aras and Kur. Though a fourfold community of name would appear to testify to a common national origin, these north-western representatives of the four Persian peoples had all, no doubt, long since become Medes in their political feelings—as the north-western Asagartiyā, at any rate, showed by embarking on the forlorn hope of rising in revolt against Darius at the call of a leader claiming to be a descendant of Cyaxares after the revolt in Media Proper had been crushed and after the leader of that revolt had been captured at Ragā (Rayy) and been executed at Ecbatana.² It is more significant that the *Pārsā* (Persai) of our lists do not include even the whole of that portion of the Persian people that had been under the sovereignty of the House of Achaemenes (Hakhāmaniš) since the reign of Achaemenes' son Teispes (Čispiš, *regnabat circa* 675–640 B.C.).

The original patrimony of the House of Achaemenes had been the canton of Parsuwaš or Parsawaš (*Assyriacè* Parsumaš or Parsamaš) in the upper basin of the River Karkhah, to the south of Media and to the north of the plains of Elam (i.e. it had been the latter-day country of Lūristān).³ Parsuwaš is mentioned in the Assyrian records as early as

¹ See Tarn: *The Greeks in Bactria and India*, pp. 292–4.

² See 'DB', §§ 32–33.

³ This location of Parsuwaš, which is Cameron's, has been adopted in this Study, as against the view (advocated by Sidney Smith in his *Isaiah, Chapters XL–LV, Literary Criticism and History* (London 1944, Milford), p. 28) that Parsuwaš was not a separate and distinct country from Pārsa, and was not situated in Lūristān, but was identical with Pārsa and was therefore situated in Fars. On this view the appanage of the Cyran elder branch of Teispes' line was Anšan alone, not Anšan-cum-Parsuwaš, while the appanage of the Ariaramnan younger branch was a Pārsa with which Parsuwaš was identical. In the present writer's amateur judgement, Sidney Smith's identification of Parsuwaš with

815 B.C.,¹ and Achaemenes (*regnabat circa* 700–675 B.C.)² must have been on the throne when Parsuwaš sent a contingent to the army of the anti-Assyrian alliance, headed by Elam, which defeated Sennacherib at Halūlah.³ Achaemenes' successor Teispes is described in later records as 'King of the city of Anšan',⁴ which must have lain somewhere on the border between Parsuwaš, Elam, and Babylonia;⁵ and it appears to have been in Teispes' reign (*circa* 675–640 B.C.) that the Achaemenian Dynasty achieved an immense extension of its dominions by adding to Parsuwaš and Anšan the whole left wing of the Persian group of Iranian peoples on the farther side of Elam in the latter-day provinces of Fars, Lūristān, and Kirmān.⁶ Teispes must have found his opportunity as a *tertius gaudens* during the great Assyro-Elamite war that had broken out in 663 B.C. and that ended, after continuing for about a quarter of a century, in the destruction of Elam and the exhaustion of the Assyrian winners of a Pyrrhic victory.

Teispes divided these expanded dominions between his elder son Cyrus I (*regnabat circa* 640–600 B.C.), to whom he bequeathed the dynasty's patrimony in Parsuwaš and Anšan, and his younger son Ariaramnes, to whom he gave the dynasty's new acquisitions in the South-East. The fortunes of the elder branch of the house were depressed when, after the destruction of Elam, Cyrus I of Anšan was compelled by one of Asshurbanipal's generals to acknowledge Assyria's overlordship and to surrender one of his sons as a hostage;⁷ but thereafter there was a dramatic reversal of fortunes which may have been a

Pārsa was less convincing than Cameron's location of it in Lūristān, and this for two reasons. In the first place a Parsuwaš with which Assyria came into military collision in the early years of the seventh century B.C. seems more likely to have lain in Lūristān than to have lain in Fars, on the farther side of Elam. In the second place it seems unlikely that, when Teispes was dividing his dominions between his two sons, he should have assigned to his younger son Ariaramnes his own hereditary patrimony Parsuwaš—as he will have done if Parsuwaš is identical with Pārsa—and have bequeathed to his elder son Cyrus I nothing more than his new acquisition Anšan. Teispes' partition of his dominions would be less difficult to account for on the view that he assigned to his elder son Cyrus I his own ancestral patrimony Parsuwaš in Lūristān, together with an Anšan that had been the earlier and the nearer of Teispes' two acquisitions, while he assigned to his younger son Ariaramnes his later and more distant acquisition Pārsa. It is geographically possible that Teispes, starting from Lūristān, should have pushed his way into Fars via Anšan in the north-west corner of the lowlands of Elam.

¹ See Cameron: *A History of Early Iran*, p. 179.

² See *ibid.*, p. 179.

³ This battle is dated 692 B.C. by Cameron, *loc. cit.*; 691 by Sidney Smith in *The Cambridge Ancient History*, vol. iii (Cambridge 1925, University Press), p. 68.

⁴ See Cameron, *op. cit.*, p. 180.

⁵ F. W. König, in his *Älteste Geschichte der Meder und Perser* (Leipzig 1934, Hinrichs), p. 9, locates Anšan somewhere not far from the district of Dêr, which lay in the north-east corner of Babylonia. Sidney Smith, in his *Isaiah, Chapters XL–LV*, p. 121 (note 27, referring to p. 28), identifies Dêr with the latter-day Badrah, just on the 'Irāqī side of the 'Irāqī–Persian frontier, east by south of Baghdad. This location of Anšan would appear to refute decisively Sidney Smith's statement, in *op. cit.*, p. 28, that 'both Parsuwaš and Anšan designate the province round Pasargadae'. In the immediately preceding sentence, Smith testifies that Anšan was 'known to the Babylonians from early Sumerian times'—i.e. from times when 'the province round Pasargadae', *alias* Pārsa, Persis, Fars, was far beyond the horizon of the Land of Shinar. This last point is made by Weissbach in P.-W., *loc. cit.*, col. 1142. See also the present Study, p. 204, above.

⁶ See Cameron, *op. cit.*, p. 212.

⁷ See Cameron, *op. cit.*, p. 204. Sidney Smith argues, in *Isaiah, Chapters XL–LV* p. 122 (note 31 referring to p. 28), that this would have been *ultra vires* for Cyrus I if he had been already under the suzerainty of his brother Ariaramnes, as Cameron suggests that he was (see p. 601, with n. 1, above).

consequence of the sudden rise of the Median Power upon the collapse of Assyria after Asshurbanipal's death. The crown of Pārsa, which Ariaramnes had inherited from his father Teispes, was certainly never worn by Ariaramnes' grandson Hystaspēs, the father of Darius I;¹ and, since we find a scion of the elder branch of the House of Achaemenes—Cambysēs I (*regnabat circa* 600–559 B.C.), son of Cyrus I and father of Cyrus II—reigning over Pārsa as well as over Parsuwaš, with the title 'King of the City of Anšan', under the suzerainty of King Cyaxares of Media,² it seems possible that the deposition of the Ariaramnan branch of the Achaemenidae may have been a consequence of a Median act of intervention that had restored the Cyran branch's fortunes, though it is also possible that King Ariaramnes' son King Arsāmēs may have retained the throne of Pārsa till he was ejected from it by Cambysēs I's son Cyrus II as one of the moves in this empire-builder's career of self-aggrandizement.³

The only indication in Darius and Xerxes' official lists of *dahyāva* that the Pārsa to which these lists give the place of honour did not include the whole of the Persian territory which had been inherited by the successors of Teispes is the separate mention of Maka in all six lists and of Asagarta as well in 'DPe'. But we should not have known how to interpret the appearance of these two names in the official lists if the key had not been given to us by Herodotus's list of the peoples comprised in his Taxation District No. 14, in which we find not only the south-eastern Mykoi (Mačiyā) and the south-eastern Sagartioi (Asagartiyā), but also the south-eastern Outioi (Yautiyā),⁴ attached to the Thamanaiοi (i.e. the Paktyes in Arachosia)⁵ and to the Sarangai (Zrāka).

¹ 'Cyrus the Great was a great-nephew of Ariaramnes, and a second cousin of Hystaspes father of Darius. I think we must credit Darius's statement that he was the ninth king of the Achaemenian line; and to me the reasonable way to enumerate them is Achaemenes, Teispes, Cyrus I, Cambyses I, Cyrus II, Cambyses II—then, turning to the other line, Ariaramnes, Arsames, Darius. Hystaspes was never King, since both he and his father Arsames were living when Darius won the throne (so DSf, §§ 12–15, and XPf, §§ 20–25), so that only Arsames could bear the royal title.'—Professor Roland G. Kent, in a note to the present writer.

The texts, with English translations, of two inscriptions found at Hamadān (Ecbatana), which purport to have been dictated by King Ariaramnes (AmH) and by his son and successor King Arsames (AsH) respectively, are published in Kent, R. G.: *Old Persian: Grammar, Texts, Lexicon* (New Haven, Conn. 1950, American Oriental Society), p. 116, with bibliographies on p. 107. See also Kent: 'The Oldest Old Persian Inscriptions', in the *Journal of the American Oriental Society*, vol. lxvi, No. 3, July–September 1946, pp. 206–12. Kent's conclusion is that 'the inscriptions of Ariaramnes and Arsames were inscribed in the time of Artaxerxes II, to do honour to the royal ancestors of Ariaramnes' line—apparently as a part of anti-Cyrus activity by Artaxerxes'.

² See Cameron, *op. cit.*, p. 218, and the present Study, p. 204, above.

³ 'Cyrus II deposed Arsames from his throne, yet not in a bitter struggle, for Arsames retained his life and apparently his liberty, and was still living when his grandson Darius became ruler of the Empire after the death of Cambyses II, son of Cyrus the Great (so in DSf, §§ 12–15, and in XPf, §§ 20–25). Possibly there was some arrangement as to alternate overlordship [cf. Sidney Smith, *Isaiah, Chapters XL–LV*, p. 29.—A. J. T.], which Cyrus unilaterally abrogated—as is usually the case in such matters. Thus it resulted that Hystaspes, son of Arsames, never had a throne of his own, and is never called King in the O.P. inscriptions when Darius mentions him as his father, though Xerxes normally gives the title to his father Darius when he names him in the inscriptions.'—R. G. Kent, in *J.A.O.S.*, vol. lxvi, No. 3, pp. 210–11, following F. H. Weissbach, in P.-W., Supplementband IV, cols. 1132–44, s.v. 'Kyros', who points out in cols. 1141–2 that, in the Babylonian Nabonidus-Cyrus Chronicle, Cyrus II is called 'King of Anšan' shortly before 548 B.C., but 'King of Parsu' in 547 B.C. See also the present Study, p. 204, above. ⁴ See pp. 637–41, below. ⁵ See pp. 593–4, above, and p. 633, below.

Pārsa in the political and constitutional sense of the domain of a privileged Persian imperial people did not, as it emerged from the upheaval of 522–521 B.C., include either Lāristān or Kirmān on the one hand or Lūristān on the other. Not only the disaffected south-eastern Mačiyā, Yautiyā, and Asagartiyā, but also a Parsuwaš that had been the Achaemenian Dynasty's original patrimony, had now been degraded to the ranks of the Empire's tax-paying subjects. While two-thirds of what had formerly been Pārsa had now been attached to Harahvatiš, the whole of the former Parsuwaš had been merged in Hūja (the Viceroyalty of Greater Elam).

As for *Māda*, we should never have known from the non-committal mention of the name in all six official lists that it had been partitioned on the Darian fiscal map into the four fragments that the Herodotean gazetteer reveals to us.

One of these fragments, Herodotus's District No. 10, which he calls 'Media' *par excellence*, appears (as soon as we have stripped away an adventitious pair of remote Sakan peoples)¹ to be confined to the environs of Ecbatana (Hamadān) and to the upland section of the Great North-East Road to the south-west of Hamadān as far as the latter-day town of Kirmānshāh inclusive.

Another fragment of Media seems to be represented by Herodotus's District No. 11, embracing the countries of the *Kaspioi*, *Pausikai*,² *Pantimathoi*, and *Dareitai*. A key to the location of this district is perhaps to be found in the last of these four names, if we are right in interpreting it to mean the people living in the neighbourhood of the Caspian Gates.

'Duvarayā', the locative singular case of the Old Persian word meaning 'door', occurs in 'DB', § 32; and in the New Persian language the compound word 'dar-band' (meaning literally 'door-barrier') came to be the technical term for one of those fortified and garrisoned passes that played so important a part in the administrative as well as the strategic geography of the Ottoman Empire under this name, and of the East Roman Empire under the graecized Latin name 'Kleisoura' (i.e. 'clausura').³ The Caspian Gates commanded one of the only two non-trans-desert roads between the main body of the Achaemenian Empire and its vast outlying territories on the farther side of the Central Desert of Iran. The road through the Caspian Gates from Māda to Parthava circumvented the north-western end of the desert; the road from Kirmān to Arachosia circumvented its south-eastern end; and in 522–521 B.C. both these strategic routes had proved to be of critical importance. The south-eastern route had carried the Yautiyan rebel Vahyaz-dāta's expeditionary force on its daring raid from Pārsa to the basin of the Kābul River; the north-western route would have brought the Median rebel Fravartiš's troops to the support of the insurgents in

¹ See pp. 594–5, above.

² The *Πανσικαὶ καὶ Παντίμαθοι* of A¹ would appear to be the right reading. The *Πανσοὶ καὶ Παντίμαθοι* of S looks like an attempt to rationalize a *Πανσοὶ καὶ Παντίμαθοι* of RV which has arisen from a *Πανσικαὶ Παντίμαθοι* of BCPA² which has arisen from the accidental omission of one of the two consecutive *καὶ*'s of the correct text.

³ See p. 82, n. 3, above.

Hyrkania (Varkāna) and Parthia (Parthava), who had raised the standard of revolt in Fravartīš's name, if they had not, like the North-Western Asagartiyā, waited to rise until after Fravartīš had been crushed.

As it turned out, Darius was able to detach troops to the aid of his father Hystaspes, the Viceroy of Parthava, from Ragā via the Caspian Gates, and this reinforcement decisively turned the tide;¹ but the incident served to illustrate the Caspian Gates' strategic importance, and Darius manifestly took both these lessons to heart. After the flames of rebellion had been stamped out, he made sure of his control over the Kirmān-Arachosia road by attaching Kirmān to the loyal viceroyalty of Harahvatiš. The security of the Caspian Gates must have concerned him equally, and the occurrence of the name Dareitai among the names of the peoples in Herodotus's eleventh district suggests that this district included the Caspian Gates within its boundaries. Ptolemy places 'the Dareitis district' at the north-eastern extremity of Media, to the east of Rhagianê (the district round Ragā, *Graecè* Rhagai), with 'the Ouadas-soi' in between.²

If the Dareitai are to be located at the Caspian Gates, this gives us a clue to the location of the three associated peoples. It is clear that they cannot have lain east of the Caspian Gates, since the immediately adjoining territories in that quarter were Hyrcania and Parthia in District No. 16. They are unlikely to have lain between the Elburz Range and the Caspian Sea, since there is no evidence that the south coast of the Caspian, west of Hyrcania, was ever under Achaemenian rule.³ Therefore they are likely to have lain west of the Caspian Gates; and, if so, we can perhaps detect the imprint of the former presence of the detachment of Kaspioi that is here associated with the Dareitai in the latter-day place-name Qazwin. We may also perhaps detect in Herodotus's Pausikai the Paesici or Pesticae who, in a Roman version of a post-

¹ See 'DB', §§ 35-37.

² See *Geographia*, Book VI, chap. ii, § 6.

³ Professor G. G. Cameron, commenting on this passage, makes the point that, since Hyrcania was undoubtedly embraced in the Achaemenian Empire, it seems unlikely that the rest of the southern shore of the Caspian Sea will have remained independent. Where, he asks, were the Cadusians, if not here? Certainly the Cadusians were to be found in this coastal strip, at its north-western end, to the north of the Gêlai (see p. 631, below). But is there any evidence that the Cadusians were ever the Achaemenidae's subjects, or even their allies? We hear of inconclusive Achaemenian punitive expeditions into Cadusian territory, and of Cadusian troops serving in Achaemenian armies; but, after all, Continental European Greece was likewise invaded by Darius I and Xerxes, and Continental European Greek soldiers of fortune were hired by Xerxes' successors. Have we any warrant for assuming that Achaemenian authority was any more effective in Cadusia than it was in, say, Attica?

No doubt, at first sight it is not easy to give credence to a map in which Gilān and Tabaristān (the latter-day Mazandarān) are depicted as lying outside the frontiers of an empire that encircles them by coming down to the shore of the Caspian on either side of them, round the mouths of the rivers Aras and Kur to the north-west and round the mouth of the River Atrak to the east, besides controlling a corridor of territory, connecting Western Iran with Khurāsān, between the southern face of the Elburz Range and the north-west corner of the Central Desert of Iran. A closer inspection, however, brings out the fact that this strip of territory is a natural fastness, where an invader who has managed to surmount or outflank the southern rampart of mountains will be baffled on the seaward slopes by forests and in the lowlands by jungles and swamps. It is perhaps relevant to recall that the Arab Caliphate, in its day, touched the shore of the Caspian round the mouths of the rivers Aras and Kur, and extended eastwards through the Caspian Gates across the Oxus to Farghānah, without succeeding in bringing Gilān or Tabaristān under its rule (see II. ii. 447-8).

Alexandrine Hellenic gazetteer,¹ are associated with the Amardi, and whom this association would locate somewhere to the north-west of Qazwīn, in the upper part of the basin of the Safid Rud, above the gorge in which it breaks through the Elburz *en route* for the Caspian. This, in turn, would lead us to look for the Pantimathoi, who were the fourth people in this district, somewhere to the west of Qazwīn.

This is where the Assyrian records appear to locate the north-western branch of the Nomad Persian people named Asagartiyā (*Assyriacè* 'Zikirtu' and 'Zakruti'; *Graecè* Sagartioi),² whom Ptolemy likewise locates to the east of the Zagros;³ and it is also just where we should expect to find a remnant of these north-western Asagartiyā surviving after the next eruption of Nomad peoples on to the Iranian Plateau from the Eurasian Steppe had sent a fresh stream of migrants pouring westward through the Caspian Gates into the basin of Lake Urmīyah and beyond it into the basin of the rivers Aras and Kur. The country between the two provinces of Ardan and Qazwīn lay astride the habitual westward route of Eurasian Nomad Völkerwanderungen south of the Caspian Sea, but it was one of the most mountainous sections of this route and was therefore one in which no migrant Nomad people would linger by preference. It would therefore not be surprising to find a batch of Asagartiyā still entrenched here between one batch of Kaspioi just behind them, round Qazwīn, and another batch of Kaspioi just in front of them, to the north of Lake Urmīyah and in the lower valleys of the rivers Aras and Kur.

On a latter-day map, this country between Qazwīn and Ardan was called 'Khamsah', which is the Arabic word for 'five', and we may perhaps venture to identify this name with that of the frontier fortress called 'Panziš' which the Assyrians built somewhere on the border between the independent territory of Asagarta and the Assyrian protectorate called Mannai in the relatively open southern part of the Urmīyah Basin, between the south end of the Lake and Parsua.⁴ If Panziš is an Assyrian version of 'panča', which means 'five' in the Old Persian language, we may perhaps hazard the guess that 'Khamsah' may have been an Arabic translation of a previous local Iranian place-name, and that the five entities commemorated in this place-name may have been five tribes constituting the north-western branch of the Asagartiyā. A Eurasian Nomad horde was apt to be an association of constituent tribes; and hordes thus constituted would sometimes style themselves 'the so many so-and-so'—e.g. 'the ten [tribes of] Uigurs' (*Turcicè* 'Onugur') or whatever the number and the name might be—as a simple way of advertising their strength. The Pañchalas, who are associated with the Kurus in the legendary tradition of an archaic age of Indic history, were believed to have been a confederacy of five tribes who

¹ In Pomponius Mela's *Chorographia*, Book III, chap. v, §§ 39 and 42. They reappear in Pliny's *Historia Naturalis*, Book VI, chap. xvii (xix), § 50.

² See Cameron, *op. cit.*, pp. 149–50; König, *op. cit.*, p. 16; Herzfeld, *op. cit.*, p. 82; Forrer, *op. cit.*, p. 75; and the present Annex, p. 608, above.

³ Ptolemy: *Geographia*, Book VI, chap. ii, § 6.

⁴ For the site of Panziš, see Forrer, *op. cit.*, p. 75; Adontz, *op. cit.*, pp. 102 and 367. 'Panziš, the strong fortress that lies over against the lands of Zikirtu and Andia' (Sargon's record of his eighth campaign (714 B.C.) in Luckenbill, *op. cit.*, vol. ii, pp. 150–1).

took their name from their number.¹ If the north-western Asagartiyā did style themselves 'the Five Tribes', the Old Persian word 'panča', meaning 'five', might perhaps account for the first two syllables of an old Persian compound proper name that makes its appearance in Greek dress as 'Pantimathoi'.

If these considerations carry any conviction, they indicate that Herodotus's Eleventh District was a chain of cantons, running west and east from the Asagartiyā in Khamsah through the Kaspioi round Qazwin as far eastward as the Caspian Gates inclusive. It is noteworthy that neither the Herodotean gazetteer nor any of the Achaemenian official lists mention by name the Median district that had for its local capital the city of Ragā, in the neighbourhood of a latter-day Tehran, where the Median pretender Fravartiš had made his last stand.² Ragā will either have been included in the canton of the Kaspioi round Qazwin, or else it will have been left out of the reckoning on account of its being an autonomous temple-state³ like Jerusalem, Comana Cataoniae, and Comana Pontica.

Is another fragment of Media to be detected in Herodotus's District No. 15? This possibility is suggested by the fact that the two names here associated by Herodotus—the *Sakai* and the *Kaspioi*—recur on a post-Alexandrine Hellenic map side by side in the lower basin of the rivers Aras and Kur in two countries called Sakasênê⁴ and Kaspianê. The Sakan contingent in this Herodotean pair of peoples stamped their name on a canton called 'Sakašayana' ('Saka-land') in the province of Utênê,⁵ between the Qārabāgh highlands and the River Kur, whose name, as we have seen, commemorated the former presence of these Sakas' local forerunners, the north-western branch of the Yautiyā. In the field-state of the army assembled by Darius Codomannus at Gaugamela in 331 B.C., Sakesīnai are brigaded with the Albanians, Cadusians, and Medes.⁶ Sakasênê is cited by Strabo in association with Araxênê and with 'Matianê in Media';⁷ and in this context both Sakasênê and Araxênê are described as being 'in Armenia'.⁸

The Armenia which Strabo, or his source, has in mind in this passage is evidently the Great Armenia that had eventually been brought into existence by the progressive expansion of a successor-state of the Seleucid Empire which, after the defeat of Antiochus III by the Romans in 190 B.C., had been founded by Artaxias, Antiochus's viceroy in one of the Seleucid Empire's two Armenian provinces.⁹ Artaxias' Armenian king-

¹ See Keith, A. Berriedale, in *The Cambridge History of India*, vol. i, p. 118. These Pañchalas' Kuru associates were perhaps the left wing of an ex-Eurasian Nomad people whose right wing had given its name to the River Kur in Transcaucasia, to the north-west of Panziš.

⁷ See Strabo: *Geographica*, Book II, chap. i, § 14 (C 73); Book XI, chap. vii, § 2 (C 509). Cp. Book XI, chap. xiv, § 4 (C 528).

⁸ Strabo, loc. cit. See also Book XI, chap. viii, § 4 (C 511).

⁹ See *ibid.*, Book XI, chap. xiv, § 5 (C 528) and § 15 (C 531).

dom did not acquire an exclusive title to the name 'Armenia' until Artaxias' descendant and successor Tigranes (*regnabat circa* 96-55 B.C.) had annexed the adjoining Armenian successor-state of the Seleucid Empire in the Upper Tigris Basin (*Graecè* Sophênê, *Assyriacè* Nâiri).¹ But in his record of the details of the previous expansion of the kingdom founded by Artaxias, before its culmination in the reign of Tigranes, Strabo mentions² its acquisition from Media of 'the Phaunîtis' (?),³ 'Basoropeda' (Vaspuragan) and Kaspianê. This Kaspianê must be the country of the Kaspioi whom Ptolemy⁴ locates on the western edge of Media, adjoining Armenia (i.e. the Greater Armenia that had come into existence since 190 B.C.); and here the Kaspioi had bequeathed their name to 'the Caspian mountain range' which is Ptolemy's name for the watershed between the basins of lakes Van and Urmîyah along which he locates the boundary between the Armenia and the Media of his day, and at whose southern extremity he locates the meeting-point of Media and Armenia with Assyria.⁵

This ex-Median Kaspianê had also stamped its name on a canton called 'Kasbi-k' (i.e. 'Kaspioi'), which is mentioned by the Armenian historians Agathangelus and Faustus of Byzantium⁶ as having been in existence in the third and fourth centuries of the Christian Era near the town of P'aitarakan in the angle between the rivers Aras and Kur just above their confluence. At an earlier date this Kaspianê must have occupied the whole of the steppe country in the lower basin of the rivers Aras and Kur from the northern rim of the basin of Lake Urmîyah on the south to the southern foothills of the Caucasus Range on the north; for in another passage Strabo records that Kaspianê extended north of the River Kur into the South-East Caucasian country called Albania.⁷

Even if it had not been expressly stated by Strabo, in a passage cited above, that Kaspianê had been part of Media before its annexation to Armenia, we could have inferred from the evidence presented by Herodotus that this Kaspianê astride the lower course of the River Aras must have been the home of one of the two or more detachments of the Kaspioi whom he mentions in his work; for Herodotus has no other name than 'Caspian' for the Caspian Sea (in contrast to the usage of the post-Alexandrine Hellenic geographers, who took to calling it 'the Hyrcanian Sea'); this Herodotean usage means that the section of the shore on which Herodotus's informants had access to this sea (and they had not only sailed on it but had coasted all round it, for they had discovered that it was landlocked)⁸ must have been inhabited by people called 'Kaspioi'; and the only Kaspioi on record who unquestionably possessed

a seaboard on the Caspian Sea were the Kaspioi who had given their name to this once Median Kaspianê on the steppes round the mouth of the River Aras. Herodotus also knew that the River Aras flowed into the Caspian Sea at the end of a course running from west to east.¹ Considering the wildness of the peoples adjoining the Caspian Sea both in and after the Achaemenian Age, it is improbable that Herodotus's sources could have learned of the existence of the sea to which they gave the name 'Caspian', or could have ascertained that the River Aras debouched into it, unless this section of the shore of the Caspian Sea, together with a hinterland inhabited by Kaspioi, had been made accessible to geographers through its having been brought under Achaemenian rule. It seems legitimate to infer that the lower basin of the rivers Aras and Kur, as far as the adjoining section of the Caspian shore, must have been included within the Achaemenian Empire's frontiers; and, if this inference is justified, then this Kaspianê which was next-door neighbour to a Sacasêne seems the obvious location for the Kaspioi who are associated with Sakai in Herodotus's District No. 15.

The westernmost of the divers fragments of Media that figure in Herodotus's gazetteer in his District No. 18, 'the *Matiênoi*, *Saspeires* and *Alarodioi*'; and, as we have observed already,² the habitats of both the Alarodioi and the Saspeires are easy to identify. The Alarodioi are the people of the former Kingdom of Urartu, which extended over the basin of Lake Van and over the upper valleys of the Eastern Euphrates (Murâd Su) and the Aras. The Saspeires are the inhabitants of the canton of Isbir, north of Urartu, in the valley of the River Choroq. It remains to locate the country named after the Matiênoi whom Herodotus associates with the Alarodioi and the Saspeires in the present context.

These easterly Matiênoi must have been a quite separate branch from those who, in the Achaemenian Age, were living within the bend of the Halys near the meeting-point between Cilicia, Cappadocia, and Phrygia;³ and, unlike those Western Matiênoi, the Eastern Matiênoi seem by this time to have been extinct; for, in the field-state of Xerxes' expeditionary force, the Eastern Matiênoi do not appear, whereas their homonyms the Western Matiênoi, and their neighbours and associates the Alarodioi and the Saspeires, are all credited with contingents whose equipment is described and whose commanders are named. The Alarodioi and Saspeires are brigaded under a single command and are both paraded in the same sub-Moschian equipment as the Kolkhoi.⁴ In this context the absence of the Eastern Matiênoi from the muster-roll is conspicuous; and this indicates that in 480 B.C. they were no longer in the land of the living. On the other hand the presence of their name in the gazetteer indicates that at this time some country was still called after them.

¹ See Herodotus, Book IV, chap. 40. In all other passages in which Herodotus mentions a river 'Araxes' (i.e. in Book I, chaps. 202 and 205, and in Book III, chap. 36), he is confounding the Aras with the Oxus or the Jaxartes or both.

² See pp. 603-4, above.

³ The evidence for the location of the Western Matiênoi is reviewed in the Note on Chronology in x. 201.

⁴ See Herodotus, Book VII, chap. 79.

If the proper noun 'Matiēnoi' in Herodotus's work stands for a place-name, and not for the name of a living people, in those passages in which Herodotus is not referring to the Western Matiēnoi on the River Halys, this place-name is not always used to denote an area of identical extent. In the description of Darius's Eighteenth Taxation District the name designates only those portions of this district, whatever they may prove to have been, that were not embraced in either Urartu or Isbir. There are other passages, however, in which the region bearing the name of these apparently extinct Eastern Matiēnoi manifestly stands, in Herodotus's mind, for 'a roof of the world' from which a number of the principal rivers of South-West Asia—the Aras, the Diyālah (Gyndes),¹ and the Lesser Zab²—flow out in all directions; and in these passages 'the Matiēnoi' is evidently a comprehensive label for the whole of District No. 18, including the domains of the Alarodioi and the Saspeires.

On the map of the Great North-West Road, which Herodotus or his source had under his eye while he was writing the account of Aristagoras of Miletus's unsuccessful solicitation of Cleomenes I of Sparta on the eve of the Ionian Revolt of 499 B.C.,³ the name 'Matiēnoi' was applied to the ex-Assyrian territories (Mygdonia, Adiabênê, and Chalonitis in the nomenclature of the post-Alexandrine Hellenic geographers) that had been annexed by Media in the Medo-Babylonian partition of Assyria in 610–609 B.C.;⁴ and, since the rest of Herodotus's description of this map

¹ See Herodotus, Book I, chaps. 189 and 202. When, in chap. 202, Herodotus writes that the Araxes and the Gyndes 'flow out of the Matiēnoi', the river represented by his 'Araxes' is manifestly the Aras, though in the same context the same name 'Araxes' means, not the Aras, but the Oxus, when it is described as constituting the frontier between Cyrus's empire and the ranges of the Central Asian Nomad Massagetae, and when it is said to have forty mouths of which only one flows out into the Caspian Sea, while the rest lose themselves in swamps and lagoons (i.e. in the marshy borders of the Sea of Aral).

² See Herodotus, Book V, chap. 52. In this passage, Herodotus mistakenly locates the source of the Greater Zab in his Armenia.

³ See Herodotus, Book V, chaps. 49–54.

⁴ In the detailed description of the Great North-West Road in Herodotus, Book V, chaps. 52–54, the text of the relevant passage in chap. 52, as it had reached the hands of Modern Western scholars, ran as follows:

'In Armenia there are fifteen stages of posting-stations, making 56½ parasangs, and among these stations there is a guard-house. Four navigable rivers flow through this country, which all have to be crossed by ferry: first the Tigris; then a pair that have the same name, though it is not the same river and does not rise from the same source; for the one that comes first in the itinerary rises among the Armenians and the one that comes second among the Matiēnoi. The fourth of these rivers is called the Gyndes (Cyrus once distributed its waters into 360 channels). When one breaks out of this Armenia into the Matienian country, there are four stages; and when one passes out of this country into the Cissian country there are eleven stages, making 42½ parasangs, up to the River Choaspes—likewise navigable—on whose banks stands the city of Susa.'

In this text there were three things that must be wrong. In the first place a figure, giving the number of parasangs in Matiēnê, must have dropped out, for this was the only country in the chart for which this entry was missing, and, in the text as it stood, the aggregate of the numbers of parasangs, given country by country with the exception of Matiēnê, fell short, by 137, of the total number of parasangs given in chap. 53. In the second place, in the text as it stood, the aggregate of the numbers of posting-stages, given country by country, fell short, by 30, of the total number of posting-stages given in chap. 52. In the third place the text as it stood differed from all other known accounts of the boundaries of Armenia in including within them the navigable section of the course of the Greater Zab and *a fortiori* in including any part of the courses of the Lesser Zab and of the Diyālah.

These errors required one addition to the text and one transposition of sentences in order to make the whole description self-consistent and to eliminate the incorrect inclusion in Armenia of the courses of the Diyālah, the lesser Zab, and the lower

agrees with his gazetteer of Darius's taxation districts, it follows that, in the gazetteer as well as on the map, these ex-Assyrian territories were associated, under the name 'Matiênoi', with Urartu and Isbir.¹

This conclusion raises the question of the geographical practicability of this administrative arrangement. What practicable route was there for maintaining communications between this fragment of Assyria and Urartu? And where was the common centre from which these two portions of Taxation District No. 18 could both be administered? The line of communications between the two territories cannot have been via the Great North-West Road; for this road, as Herodotus charts its course, ran north-westwards out of the ex-Assyrian territory embraced in 'the Matiênoi' into Armenia direct, without passing through Urartu *en route*. Nor can the line of communications between this ex-Assyrian territory and Urartu have run to the east of the River Tigris over the highlands of Gordyênê in the angle between the Tigris and the Centrîtês (Bohtân); for, when Xenophon and his comrades took that route in 401 B.C., they found no road; they had to fight every inch of their way across the mountains; and, when they had struggled through to the north bank of the Centrîtês, they found themselves, not in Urartu, but in 'Armenia' (or, more precisely, in Arzanênê).² Nor was there any

reaches of the Greater Zab; and, after these requisite emendations, the corrected text would read:

'In Armenia there are fifteen stages of posting-stations, making 56½ parasangs, and among these stations there is a guard-house. When one breaks out of this Armenia into the Matienian country, there are four [and thirty] stages, [making 137 parasangs]. Four navigable rivers flow through this country, which all have to be crossed by ferry: first the Tigris; then a pair that have the same name, though it is not the same river and does not rise from the same source; for the one that comes first in the itinerary rises among the Armenians and the one that comes second among the Matiênoi. The fourth of these rivers is called the Gyndes (Cyrus once distributed its waters into 360 channels). And when one passes out of this country into the Cissian country there are eleven stages, making 42½ parasangs, up to the River Choaspes—likewise navigable—on whose banks stands the city of Susa.'

On the outward journey from Susa, the road, after passing out of 'Cissia' into 'Matiênê', will have intersected with the Babylon-Ecbatana road (see p. 210, n. 3, above); then crossed first the Diyâlah and next the Lower Zab to Arbela; crossed the Upper Zab to the site of Nineveh on the east bank of the Tigris; and crossed the Tigris at the crossing taken by the former Assyrian military road leading to Naîri (i.e. at or near the site of Nineveh, and not as far north as Bezabde, where in 331 B.C. Alexander was to cross the Tigris in the opposite direction). The road will then have run through Nisibis (giving a wide berth to the Tigris gorge between the Tûr 'Abdîn highlands (Mount Masius), in the angle of the Tigris, and the highlands of Gordyênê on the farther side), and will finally have passed out of the Khabûr Basin into the Upper Tigris Basin—and simultaneously out of Matiênê into Armenia—between the Tûr 'Abdîn on the right hand and Mount Izâlâ on the left. This pass leading out of the Khabûr Basin into the Upper Tigris Basin was one of the positions at which the Armenian insurgents had brought Darius's flying columns to a halt in 522–521 B.C. (see 'DB', §§ 29–30).

The distance by road, as measured on a map that was up to date in A.D. 1952, from Mardin via Diyârbakr, the head-waters of the Western Tigris and Kharpût to the crossing of the Euphrates *en route* from Kharpût to Malatyah worked out at approximately 312½ kilometres, making about 52½ parasangs. Allowing for possible variations in the route and possible inaccuracies in both sets of measurements, this came sufficiently near to Herodotus's figure of 56½ parasangs for the Armenian section of the Great North-West Road to make it likely that the south-eastern terminal of this section was at or near Mardin, considering that the north-western terminal is expressly stated by Herodotus to have been at the crossing of the Euphrates between Armenia and Cilicia.

¹ This group of *dahyâva* reappears in 'the Syspirîtis as far as Kalakhanê and Adiabênê' mentioned in Strabo: *Geographica*, Book XI, chap. iv, § 8 (C 503), and chap. xiv, § 12 (C 530).

² See Xenophon: *Expeditio Cyri*, Book III, chap. v, § 15; Book IV, chap. iii, especially IV. iii. 1.

other practicable south-and-north route anywhere between the east bank of the Tigris and the crest of the Zagros Range; for the upper valley of the Greater Zab is, not a passage, but a cul-de-sac, as a remnant of the Nestorian Christians were eventually to demonstrate by ensconcing themselves in this fastness.¹

If the former metropolitan territory of Assyria was in truth associated with Urartu in one and the same taxation district on the Darian fiscal map of the Achaemenian Empire, these two territories' practical point of junction and seat of administration must have lain somewhere to the east of the North-Western Zagros in the basin of Lake Urmīyah. From the Urmīyah Basin there were practicable routes leading not only south-westward into Assyria but also westward into the basin of Lake Van and north-westward into the upper valley of the River Aras. The practicability of these lines of communication radiating from the Urmīyah Basin is attested by the long history of the warfare between Assyria and Urartu in this arena. The Assyrian name for this relatively open country was 'Mannai', which might be a contraction of a local name which was subsequently Hellenized as 'Matiēnoi' by Herodotus or his source; and this location of Herodotus's eastern 'Matiēnoi' is confirmed by the reappearance of this name precisely here on the post-Alexandrine Hellenic map of South-West Asia.

We have already noticed² that, in a passage that occurs twice in Strabo's work, a 'Matianē in Media' is associated with Araxēnē and Sakasēnē, and Strabo elsewhere gives further indications which are in consonance both with these and with one another: Matianē is Media Atropatēnē's northern neighbour;³ the northern parts of Media extend from the Caspian Gates and Rhagai (Ragā) as far west as Matianē and Armenia;⁴ the Matianoī, as well as the Medes, march, under the lee of the Parakhoathra Range, with the Kadousioi⁵ (who are located along the west shore of the Caspian Sea, immediately to the north of the Gēlai, i.e. of Gīlān),⁶ while, according to Ptolemy,⁷ Martianē [*sic*]⁸ also marches with the [eastern] flank of Assyria along its whole length, and with the southern border of the Kaspioi who lie in Media.

These fragmentary pieces of evidence, taken together, locate the name 'Matianē' in the basin of Lake Urmīyah; and the lake itself is called 'Lake Martianē' by Ptolemy and 'Lake Mantianē' by Strabo in one passage.⁹ We may conclude that the basin of Lake Urmīyah, as well as

¹ See II. ii. 257-8.

² On p. 626, above.

³ Strabo: *Geographica*, Book XI, chap. xiii, § 2 (C 523).

⁴ Ibid., § 7 (C 525). In this statement Strabo is perhaps following Polybius, Book V, chap. 44, § 9, where the Matianoī are associated with the Kadousioi as two of Media's neighbours on the north.

⁵ See Strabo, *Geographica*, Book XI, chap. viii, § 8 (C 514).

⁶ See *ibid.*, chap. vii, § 1 (C 508), and chap. viii, § 1 (C 510). Pliny identifies the Cadusii with the Gelae or Gaeli in a passage (*Historia Naturalis*, Book VI, chap. xvi (xviii), § 48) in which he mentions them in juxtaposition with the Matieni.

⁷ *Geographia*, Book VI, chap. ii, § 5.

⁸ 'The Old Persian word *martiya* meaning "man", which gives certain other place-names, is an easy source for a change of Mat- to Mart-.'—Note by Professor Roland G. Kent.

⁹ Strabo: *Geographica*, Book XI, chap. xiv, § 8 (C 529). In this passage, Strabo locates his 'Lake Mantianē' in Armenia, but nevertheless it is clear that he is referring to Lake Urmīyah, since he mentions Lake Van ('Lake Arsēnē, *alias* Lake Thōpītis) in the next

the ex-Assyrian territory that had fallen to Media in the partition of 610-609 B.C., was associated with Urartu and Isbir in the Eighteenth Taxation District; that the administrative capital of the whole district lay somewhere in the Urmīyah Basin; and that on this account the whole of District No. 18 was sometimes called 'the Matiēnoi' for short.

This usage would also be politically convenient, since the name of an extinct people would not awaken any such politically dangerous memories as might still come to life at the sound of the names 'Media' and 'Assyria'. The Eastern Mitanni had, in truth, been dead since the annihilation of their empire by the Hittites and the Assyrians in the fourteenth century B.C. In the last phase of its history this East-Mitannian Empire had been ruled from a capital somewhere in the basin of the River Khabūr in Mesopotamia. The survival of the name in the basin of Lake Urmīyah testified that this had been a previous station of the Mitanni on their westward trek from Central Asia via the Caspian Gates; and it is possible that, after moving their political headquarters down into the Khabūr Basin, they had still retained summer pastures in the Urmīyah Basin, like their Turkish-speaking Eurasian Nomad successors the Black Sheep Türkmens and White Sheep Türkmens in the fifteenth century of the Christian Era. The routes between Mesopotamia and the Urmīyah Basin across Adiabênê were under the control of the Mitanni when, at the height of their power, they exercised a suzerainty not only over Asshur but also over Arrapkha.¹

If we now cast up the total of figures in Euboic talents which Herodotus gives for the four taxation districts into which the Viceroyalty of Media had been carved up, we shall see that Media had been penalized financially as well as politically; for the total comes to 1,000, and this is the figure which, in the Herodotean gazetteer, is the assessment on Babylonia, which was a much more populous and wealthy country in the Achaemenian Age than all four fiscal sections of Media added together. In order to be sure that these two figures were truly comparable, we should have, of course, to be sure, first, that (except for the payments in kind explicitly mentioned in this context) they both of them represented comprehensive valuations of imposts of all kinds, including the costs of maintenance of the Imperial Court and Imperial Standing Army during their alternating periods of residence at Ecbatana and at Babylon, and on this point we are in the dark. Yet, even allowing for this uncertain element in the comparison, it looks as if the Darian assessment on Media had been exceptionally heavy.

sentence. In this passage Strabo says that 'Mantianê' means 'ultramarine blue' (Kyanê); but this is actually the meaning of the Armenian word 'kapoit' which can be detected in the alternative name 'Kapauta' (corrupted into 'Spauta' in the extant text) which Strabo gives to Lake Urmīyah in Book VI, chap. xiii, § 2 (C 523). A comparison of XI. xiv, § 8 (C 529), with I. iii, § 4 (C 49), in which Strabo cites the fifth-century Lydian historian Xanthus's observation of geological phenomena indicating that areas which were now dry land had once been covered by the sea, shows that the 'salt lakes in Armenia and the Matiēnoi and Lower Phrygia' which Xanthus had cited as evidence in support of his thesis must be respectively Lake Van, Lake Urmīyah, and the Tuz Gölü (*Graecè* Tatta) in Central Anatolia.

¹ See Götzke, A.: *Hethiter, Churriter und Assyrer* (Leipzig 1936, Harrassowitz), pp. 98-99 and 116-17. Professor G. G. Cameron equates Arrapkha with the latter-day Kirkūk.

The *dahyāuš* called 'Hūja' (written 'Ūvja') in the official lists and 'Kissioi' by Herodotus included the wild highland northern and north-western hinterland of Elam as well as the ancient seat of civilization in the lowlands; and both the official and the Herodotean name are taken from the hill-country and not from the plains. Hūja reappears in the Greek 'Ouxioi', the Arabic plural Ahwāz, and the New Persian place-name Khūzistān.¹ 'Kissioi' must stand for 'Kassites',² whose rearguard in the Zagros, marching with the south-eastern paraitaka of Media, lived on through the Achaemenian Age to give a rough reception to Antigonus when, after Alexander's death, the Macedonian war-lords were fighting over the division of the Achaemenian Empire's carcass.³ In the absence of any indications to the contrary, we may take it that this Greater Elam, which constituted a single taxation district (the Herodotean District No. 8) on the fiscal map, also constituted, on the political map, a single viceroyalty.

In the South-Eastern Quarter of the Achaemenian Empire, the *Harahvatiš* (written *Harawatiš*; *Graecè* Arakhosia) of the Achaemenian lists is, as we have seen,⁴ the *dahyāuš* whose people Herodotus calls 'Thamanaioi' (signifying 'borderers') in his gazetteer and by their national name 'Paktyes' in his field-state.

Eastward, the Achaemenian Harahvatiš seems to have extended as far as the west bank of the Indus in a region which, in the nineteenth century of the Christian Era, was still known as 'the Dāmān' as well as 'the Darajāt'. At least, this seems to be the most convincing interpretation of Herodotus's statements that the city of Kaspattyros and the Paktan country (i.e. Harahvatiš) marched with the northernmost and most warlike of the Indoi, who were sent to collect the gold from the Indian Desert,⁵ and that the city of Kaspattyros and the Paktan country had also been the point of departure from which Scylax of Caryanda and his shipmates had sailed down the Indus, out into the Indian Ocean, and up the Red Sea to an Egyptian port on a voyage of exploration on which they had been dispatched by Darius.⁶ This interpretation of these two statements of Herodotus's is borne out by Eratosthenes' statement⁷ that 'the Arakhōtoi' (i.e. the Viceroyalty of Harahvatiš), as well as the Paropanisadai (i.e. Gādara) to the north of them and the Gedrosians (i.e. Herodotus's Taxation District No. 18) to the south of them, extended eastwards as far as the west bank of the River Indus before Seleucus Nicātor's cession of portions of these provinces to Chandragupta Maurya.

If Herodotus's 'Kaspattyros' is a less accurate Hellenic rendering than Hecataeus's 'Kaspapyros' for this Indus river-port's authentic name, Herzfeld may be right in reconstructing an original Sanskrit name

¹ See Le Strange, G.: *The Lands of the Eastern Caliphate* (Cambridge 1905, University Press), p. 232, and the present Study, p. 209, n. 3, above.

² It is noteworthy that the two names of the original patrimony of the House of Achaemenes and its Cyran branch in Lūristān and Pusht-i-Kuh—Parsuwaš and Anšan—have both been passed over in the official and in the Herodotean nomenclature alike.

³ This incident has been noticed on p. 210, n. 3, above.

⁴ On pp. 593-4, above.

⁶ See Herodotus, Book IV, chap. 44.

⁷ Preserved in Strabo: *Geographica*, Book XV, chap. ii, § 9 (C 724).

'Kāśyapa-pura';¹ and, whatever the exact location of this river-port may have been, we may venture to interpret its meaning as 'the Caspians' city', and to see in it the entrepôt between an inland navigation in the Indus Basin and overland caravan routes between the Indus Valley and Eastern Iran via the passes through the Sulaymān Range.

In the early years of the nineteenth century of the Christian Era, when English observers were obtaining their first view of the eastern fringes of a then dissolving Afghan Empire, there was a busy seasonal migration through these passes between the Dāmān, along the west bank of the Indus, and both Qandahar² (in what had once been the heart of the Achaemenian *dahyāuš* Harahvatiš) and Kābul (in the former *dahyāuš* Gādāra); and we may guess that, in so conservative a quarter of the *Oikoumenē*, this traffic—in which trade was combined with the seasonal movement of flocks and herds between summer pastures on the Iranian Plateau and winter pastures in the Indus Valley³—had been carried on, year by year, ever since the Achaemenian Age. If the traffic was in truth already active in Darius's day,⁴ this would have been the consideration that prompted 'the Huckster'⁵ to explore the possibility of extending an already flourishing trade-route, on one section of which the goods were already water-borne, from the inland waterways of the Indus system out into the Indian Ocean and round Arabia to the Red Sea ports of the Egyptian province of his empire;⁶ and, if Kaspapyros, wherever its exact site may have been,⁷ was the river-port on which the

¹ See Herzfeld, *op. cit.*, p. 94.

² The place-name 'Qandahar' seems to be neither a survival of the place-name 'Gādāra' nor a derivative from the personal name 'Alexander', but to stand for 'Gondophareia', the city of the Parthian Suren Gondophares (see Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 471), who was reigning in the first quarter of the first century of the Christian Era (see *ibid.*, pp. 344 and 347).

³ See the descriptions in Elphinstone, M.: *An Account of the Kingdom of Caubul and its Dependencies*, new ed. (London 1839, Bentley, 2 vols.), vol. i, pp. 378–88, and vol. ii, pp. 58–59; and Burnes, A.: *Travels into Bokhara* (London 1824, John Murray, 3 vols.), vol. ii, pp. 415–16.

⁴ Tarn, in *op. cit.*, p. 100, n. 3, points out that Darius I obtained ivory from Arachosia according to the inscription from the apadāna at Susa, line 43, and that Darius III Codomannus obtained elephants from it according to Arrian: *Expediitio Alexandri*, Book III, chap. viii, § 6, in the context of § 4.

⁵ Herodotus, Book III, chap. 89, quoted on p. 613, n. 1, above.

⁶ Darius—who, like Peter the Great, had a keen eye for natural resources, communications, commerce, and finance—is likely to have been as much excited as were the British empire-builders in the early nineteenth century of the Christian Era over the prospect of the profits to be made by developing the trade via the Indus waterway between Iran and the Oxus Basin on the one hand and the Indian sub-continent and the Indian Ocean on the other. A notion of the report that will have been submitted to Darius by Scylax may be obtained by reading Alexander Burnes' 'Report of the establishment of an Entrepôt, or Fair, for the Indus Trade', printed as Appendix I to his *Cabool*, 2nd ed. (London 1843, John Murray), on pp. 283–303. In the history of the Achaemenian, as in that of the British, Rāj, military conquest was the sequel to commercial exploration.

⁷ Some light on the probable location of the historic entrepôt named Kaspapyros is thrown by Burnes' discussion, in the report cited just above, of the respective merits of divers alternative possible locations for a projected entrepôt for the Indus trade that was to be established under British auspices. After entering into a comparative consideration of the four entrepôts in the Indus Basin that were currently frequented by the Lohāni Afghan traders—Dera Ismā'il Khan and Dera Ghāzi Khan in the Darajāt (Dāmān) on the west bank of the Indus, Multān near the south-east bank of the Lower Chenab, and Bahawalpur near the south-east bank of the Sutlej, not far above its confluence with the Chenab—and then proceeding also to consider Qalabagh, on the west bank of the Indus, as the northernmost feasible point, and Mithankot, likewise on the

traffic from Gādāra as well as the traffic from Harahvatiš converged,¹ we can see why Hecataeus² called it 'a Gandarian city' and why Herodotus located it in 'the Pactyan country', in spite of its being a Caspian foundation.

Hecataeus³ also describes Kaspapyros as being 'a "shore" or "promontory" (*Graecè* "aktē") of the Scythians', and we have already seen reason⁴ for numbering the *Kaspioi* among the Eurasian Nomad peoples who had broken out of the Steppe and mounted the Iranian Plateau, between the Caspian Sea and the Pamirs, in the eighth or seventh century B.C. While the right wing of these Caspii will have ridden on due west to bequeath their name first to the Caspian Gates and then to the Caspian Sea after they had been brought to a halt in the lower basin of the rivers Aras and Kur against the barriers of the Qarabagh and the Caucasus, the left wing will have swerved leftwards and ridden across Parthava, Haraiva, and Harahvatiš till they were brought to a halt against the barrier of the Sulaymān Mountains.⁵ We shall probably not

west bank just below the confluence between the Indus and the united waters of the five rivers of the Panjab, Burnes opts for Dera Ghāzi Khan.

'It embraces not only the trade of the Punjab and India, of Candahar and Cabool, but of the more remote capitals dependent on them, Herat and Bokhara. . . . From Bombay to Dera Ghazee the water communication is open, and from the Upper Indus the intercourse is equally available. In former times many roads led down upon this town from the west. Time and peace will, in all probability, again open these now forsaken lines; and thus will be concentrated in one point all the desirable means of approach' (op. cit., p. 287).

If ever a fragment of Scylax's report to Darius were to be recovered from the Achaemenian archives at Susa or Persepolis, it would not be surprising to find it anticipating the latter-day English explorer's words.

¹ The itinerary (originally recorded by the surveyors attached to Alexander's expeditionary force) of one route leading from the Caspian Gates to some point on the west bank of the Indus had been preserved in two versions: by Strabo in a couple of passages (*Geographica*, Book XI, chap. viii, § 9 (C 514), and Book XV, chap. viii, § 8 (C 723)) derived from Eratosthenes' work, and by Pliny (*Historia Naturalis*, Book VI, chap. xvi (xxi), §§ 61-62).

This route ran from the Caspian Gates via Hecatompylus in Parthia to Alexandria in Areia (Herat), and thence to Ortospana (Kābul) either direct, over the mountains, through Bactria, or alternatively in a southward loop via Prophthasia in Drangiana and the provincial capital of the Viceroyalty of Arachosia (? Qal'at-i-Gilzai). From Ortospana (Kābul) the route followed the valley of the Kābul River eastwards to the Indus. In both the passages in Strabo's *Geographica*, Ortospana (Kābul) is described as being 'the point of access to the junction of the three roads from Bactria' (*ὁρδὸς πᾶνα ἐπὶ τὴν ἐκ Βάκτρων πρὸς ὁδὸν*), but, of course, this description applies only for a traveller approaching Ortospana (Kābul) by the roundabout southern alternative route, since the direct route through the Bactrian hill-country would have brought the traveller to 'the junction'—i.e. to the twin cities Kāpiša and Kāniš, astride the confluence of the Panjshir and Ghorband tributaries of the Kābul River (see p. 640, with n. 2, below)—on his way to Ortospana.

² As quoted by Stephanus of Byzantium, s.v. 'Kaspapyros'.

³ Apud Stephanum.

⁴ On pp. 608-9, above.

⁵ This hypothetical route of the South-Eastern Kaspii in the Völkerwanderung of the eighth and seventh centuries B.C. was demonstrably followed by their fellow Sakā the Tūrā in the Völkerwanderung of the second century B.C. In the *Avesta* the Tūrā make their appearance, in company with the Airyā (? Alanoi), Sairimā (Sarmatai), Sāinavās (? Sannoi) and Dahā (Dahai), among the Iranian Nomad peoples on the Central Asian Steppe who gave Zarathustra a good reception when he made his *hijrah* (see Nyberg, op. cit., pp. 237, 249-51, and 297). A district of Khwārizm still bore the name Tūr in the Sasanian Age (see *ibid.*, p. 251). The emergence, after the beginning of the Christian Era, of the legendary Turan patriarch Fryāna's name in the Hellenized form 'Phlianos' in the Hellenic city-state of Olbia on the Black Sea coast of the Great Western Bay of the Eurasian Steppe indicates that one detachment of the Tūrā had accompanied the Sarmatians in their westward trek north of the Caspian Sea (see *ibid.*, pp. 237 and 251). Another detachment of Tūrā, however, must have mounted the

be far wrong if we locate these Eastern Kaspioi here, between the Eastern Paktyes in the Hilmand Basin to the west of them and the middle course of the River Indus to the east.¹

In the Herodotean field-state—they do not figure in the gazetteer—the Eastern Kaspioi are mentioned immediately after the Gandarioi and the Dadikai, who, in the gazetteer, figure in Taxation District No. 7, and the Caspians' commander is the brother of the commander of the Dadico-Gandarian brigade. On the other hand the Kaspioi are also associated with the Paktyes by being paraded, like these, in the *sisyryna*—the Greek name for the sheepskin or felt top-coat, *Pactyicè* 'pustīn', which in the early nineteenth century was still a distinctive feature in the national costume of the Western Afghans, and which Elphinstone² describes as

'a large cloak of well-tanned sheep-skin with the wool inside, or of soft and pliant grey felt. This garment is worn loose over the shoulders, with the sleeves hanging down, and reaches to the ankles.'

If the reader feels moved to ask how an ex-Central Asian people who had founded a city in the Indus Basin could have persisted, in their torrid new abode, in suffocating themselves under this ancestral article of arctic dress, the writer has a twofold rejoinder to make. He can point out that the Circassian refugees from the North-Western Caucasus who were settled by the Ottoman Government in Transjordan in the nineteenth century of the Christian Era showed a comparable conservatism in clinging to their ancestral costume; and he can quote Elphinstone's authority for the fact that, in the Dāmān in the same century, the *sisyryna* was still part of the Eastern Afghans' winter dress.

'Though their summer dress is nearly the same as that of India . . . and . . . even in winter they wear turbans, . . . at that season they also wear brown and grey woollen great coats and posteens.'³

On this showing, Herodotus's parade of the Eastern Kaspioi in *sisyrynai* is not incompatible with a location which would allow them to have been the founders of the river-port of Kaspā-pyros in the tropical lowlands of the Middle Indus Basin.

Iranian Plateau and then wheeled south-east; for in the 'Abbasid Age the name Tūrān was borne by a canton in Eastern Baluchistan in the neighbourhood of the latter-day Khanate of Qal'at (see Le Strange, *op. cit.*, pp. 331-2), and in the twentieth century of the Christian Era a community of Tūris was still to be found alive among the Sulaymān Mountains in the upper valley of the Kurram River, immediately to the south of the Kābul Valley (Gādāra). These Tūris were said to have formerly been pastoral nomads who migrated twice a year between summer pastures in the Kurram Valley and winter pastures round Qalabagh on the west bank of the Indus north of the Salt Range (see Pennell, T. L.: *Among the Wild Tribes of the Afghan Frontier* (London 1912, Seeley Service), pp. 55-56). On their way from the Central Asian Steppe to the eastern edge of the Iranian Plateau, the Tūrā had bequeathed their national legend to a school of epic poetry that was to arise in their wake in the former Achaemenian *dahyāuš* Zrāka, on which the name Seistan was stamped by the hoof of the Saka horse *en route* (see V. v. 600-2).

¹ If W. H. Schoff, in his edition of *The Periplus of the Erythraean Sea* (London 1912, Longmans Green), p. 189, is right in deriving the latter-day name 'Kashmir' from an original Sanscrit compound 'Kāsyapa-mata' meaning 'home of the Kāsyapa', we may infer that another detachment of the Eastern Kaspioi lodged itself in Kashmir, and that the name of a forgotten people was posthumously interpreted as the name of a legendary pre-Gautaman Buddha in the hagiography of the Mahāyāna.

² In *op. cit.*, vol. i, p. 313.

³ Elphinstone, *op. cit.*, vol. ii, p. 59.

While it thus seems possible that Darius's Harahvatiš may have extended eastward as far as the west bank of the River Indus, it is certain that, on the political map, the Viceroyalty of Harahvatiš in the later years of Darius I's reign extended westward to include *Zrāka*¹ in the latter-day Seistan, and that, on the fiscal map, the taxation district in which Harahvatiš was included (the Herodotean District No. 14) extended south-westward as far as the north-east shore of the Persian Gulf, to include the *Asagartiyā* (Sagartioi) in Kirmān, the *Yautiyā* (Outioi) in North-Eastern Lāristān, the *Mačiyā* (Mykoi) in South-western Lāristān, along the seaboard,² and the Median deportees ('the *déracinés*') on the inshore islands.³

On the evidence, which we have already noticed,⁴ of variations in the order of the names on the official lists, we can conclude that *Zrāka* must have been transferred from the Viceroyalty of Parthava to the Viceroyalty of Harahvatiš between the dates of composition of 'DPe' and 'DZd', and we can discern two considerations, either or both of which may have moved Darius to make this change in the political map. On the one hand it would have the effect of diminishing the territory and population of a viceroyalty whose leading people had demonstrated its hostility to the Ariaramnan branch of the House of Achaemenes in 522-521 B.C., when the Parthians, as well as the Hyrcanians, had risen against their viceroy, Darius's father Hystaspes. In the second place, this transfer would widen the corridor between the loyal Viceroyalty of Harahvatiš and those dissident Persian tribes—the South-Eastern *Asagartiyā* in Kirmān and the South-Eastern *Yautiyā* and *Mačiyā* in Lāristān—whom Darius had attached to Harahvatiš for fiscal purposes after having degraded them to the ranks of his tax-paying subjects from their previously privileged status as constituent clans of the imperial people.

The *South-Eastern Asagartiyā* (Sagartioi) are described in the Herodotean field-state of Xerxes' expeditionary force⁵ as being a still culturally conservative Nomad people⁶ who fought only as cavalry and whose master weapon was the lasso. Their language was Persian, and in 480 B.C. they were attached to the Persian infantry in Xerxes' army, but their equipment was betwixt and between the Persian and the Pactyan; and this last piece of Herodotean information suggests that these Sagartians' country must have been Kirmān (O.P. Karmāna; *Latinè* Carmania), which lay immediately to the north-east of Lāristān and Fars,⁷ while it faced *Zrāka* and Harahvatiš across the south-eastern end of the Central Desert of Iran. In the twentieth century of the Christian Era a people who made their livelihood by stock-breeding could not have

¹ See p. 589, with n. 3, above.

² See p. 622, above. In the field-state of Xerxes' expeditionary force the Outioi and Mykoi are paraded in Pactyan equipment, but the Outian and Mykan contingents are brigaded with one another under a separate command (see Herodotus, Book VII, chap. 68).

³ See pp. 602 and 623, above.

⁴ On p. 589, above.

⁵ In Book VII, chap. 85.

⁶ They still had a prejudice against metal weapons, except for poignards ('enkheiridia').

⁷ According to Strabo: *Geographica*, Book XV, chap. ii, § 8 (C 723), Carmania marched with the south-eastern paraitaka of Media: i.e. Carmania included the latter-day canton of Yazd, as is expressly stated by Ptolemy: *Geographia*, Book VI, chap. vi, § 2. 'Karmāna is mentioned in DSf, § 35, as a source of gold for Darius's palace at Susa.'—Professor Roland G. Kent.

won a living off a landscape that had come to be a desert punctuated at rare intervals with oases intensively cultivated by irrigation. This desert, however, was at least partly man-made. As recently as the 'Abbasid Age the forests with which the mountains of Kirmān had originally been clothed had not yet all been cut down,¹ and in an earlier age, when the forests were still intact, Kirmān seems likely to have had sufficient rainfall to keep large tracts of the country fit to serve as pasture-land, and its pastoral Sagartian occupants will have been proportionately numerous, prosperous, and powerful.

Though these south-eastern, unlike the north-western, Asagartiyā are not mentioned by name in Darius's inscription on the cliff at Behistan as having taken part in the disorders of 522–521 B.C., the fact that their name is mentioned in only one of the six official lists of *dahyāva*² suggests that they too were in disgrace. We may infer that they had been one of the Persian clans that had taken up arms against Darius under Vahyazdāta's leadership; and, since the force which Vahyazdāta detached to invade Gādāra could hardly have covered the immense distances that it did cover unless it had been mounted, we may guess that the Sagartian horse were the backbone of it.

As for the *Yautiyā*, who were Vahyazdāta's own clan, the measure of their disgrace might be gauged from the fact that their name was passed over in all the official lists; and the reason for this official ostracism was revealed in the creditably frank account of Vahyazdāta's movement which Darius had made public in his Behistan record.³ The truth—and Darius does not attempt here to conceal it—was that Vahyazdāta's challenge to Darius's pretensions was by far the most dangerous of all the crises with which this Ariaramnan pretender to a Cyran imperial crown found himself confronted in that terrible year; for, while the Armenians may have been Darius's most resolute, and the Medes his most powerful, adversaries on a strictly military reckoning, Vahyazdāta was politically by far the most formidable of all Darius's competitors. The Elamites, Margians, Thatagu[? d or v]iyā and Sakā were fighting simply for the recovery of their local independence, while the Babylonians (without their former subjects' goodwill) and the Medes (with their former subjects' active support) were fighting for the re-establishment of their pre-Cyran empires; but none of these non-Persian opponents of Darius's aspired, as Darius himself aspired, to reign without a peer over the whole *Oikoumenē* as the acknowledged legitimate successor of the universal monarch Cyrus II. Vahyazdāta alone challenged Darius in terms of Darius's own pretensions.

Vahyazdāta of Tāravā, like Darius, was a Persian; and so, for that matter, had been Martiya of Kuganakā; but Martiya had aimed at nothing more ambitious than to put himself at the head of a nationalist movement in Elam, and he had accordingly proclaimed himself to be a scion of the Elamite royal family.⁴ In sharp contrast to the modesty of

¹ See, for example, Le Strange, *op. cit.*, pp. 315 and 316.

² In 'DPe'.

³ See 'DB', §§ 40–48.

⁴ See 'DP', §§ 22–23. Martiya's bid for the crown of Elam suggests that he may have been a Persian whose native city, Kuganakā, lay, not in Pārsa (Fars), but in Parsuwaš (Lūristān).

Martiya's pretensions, Vahyazdāta had the audacity to impersonate Cyrus II's son Smerdis himself, whose claim to the imperial throne, were he really still alive, was incontestably paramount over the claim of a usurper descended from the Ariaramnan branch of the Achae-menidae. Vahyazdāta's *pronunciamiento* won the support, not only of his own Yautiyā clansmen, but of a strong enough faction in Pārsa at large, including at least some of the garrison of the imperial palace there, to enable him to establish himself in Pārsa as king; and this *fait accompli* was a dire blow to Darius's cause, considering that Pārsa had been the appanage, not of Cyrus the great-grandfather of the Smerdis whom Vahyazdāta was impersonating, but of Darius's great-grandfather Ariaramnes.

Moreover, Vahyazdāta did not make the mistake of resting on his oars. Like Darius, he promptly sought to vindicate his pretension to legitimacy by vigorously taking the offensive against all who ventured to contest it; and, in his military operations for taking possession of Cyrus II's patrimony, he gave proof of high strategic ability. He made it his first objective to occupy the basin of the Kābul River in Gādāra—a node of strategic routes¹ where, once entrenched, he would have been able at once to cut the communications between Darius's two principal supporters the viceroys of Harahvatiš and Bākhtriš, to establish contact between his own forces and the insurgents in the Panjab (Thataguš),² and perhaps to rekindle the flames of revolt in the Viceroy of Bactria's disaffected canton Marguš, which marched with the disaffected cantons Parthava and Varkāna in Darius's father Hystaspes' viceroyalty of Parthia. The stakes for which Vahyazdāta was playing when he detached a force to occupy the Kābul Basin were nothing less than the establishment of his rule over the whole South-East and whole North-East of the Achaemenian Empire; and, if once this had been achieved, the provinces in the Indus Valley would inevitably also have fallen into his lap. If Vahyazdāta's eastern plan of campaign had succeeded, Darius's cause would have been lost, and Vahyazdāta could have afforded to wait for the news of Darius's death before attempting to settle accounts with the would-be restorer of the Median Empire, Fravartiš.

Vahyazdāta did come within an ace of success, for the Viceroy of Harahvatiš, Vivāna, did not succeed in making contact with Vahyazdāta's expeditionary force until this had reached the pair of twin cities³

¹ See p. 635, n. 1, above.

² Thataguš was in revolt, on the testimony of 'DB', § 21.

³ Kāpišakāniš (written as a single word, like Budapest, without the use of the sign for dividing words that was possessed by the Old Persian script) is the name given to this pair of cities in 'DB', § 45. This is manifestly identical with the Kapisa-Alexandria of the post-Alexandrine Hellenic geographers (see Tarn, *The Greeks in Bactria and India*, pp. 96-98, 139-40, and 460-2, together with map 3 at the end of the book). Darius has here given us the pre-Hellenic name of the west-bank twin of the east-bank city of Kāpiša. Kāniš will have occupied the site which, in latter-day Pakhtu parlance, was called 'begram', 'the city', *par excellence* (see *ibid.*, p. 462). This pair of cities attained the zenith of its importance in the Kushan Age. Kujula, the founder of the Kushan Empire (see *ibid.*, p. 338), will have taken his surname Kadphises to commemorate his acquisition of a Kāpiša which had lost none of its strategic importance during the five and a half centuries that had passed since Vahyazdāta's cause had been lost, and Darius's won, in a battle at this key point in 522-521 B.C. Kujula Kadphises' second successor

astride the confluence of the Panjshir and Ghorband tributaries of the Kābul River, where the road running north-eastward from the *dahyāuš* of Harahvatiš in the Hilmand Basin via Ghaznah and Kābul (*Graecè* Kôphên, *Sinicè* Ki-pin) divided into three branches¹ threading their way through the Hindu Kush by as many different passes—one road making north-eastwards for the upper valley of the Oxus,² while the other two roads both led by diverse routes to Balkh, the capital of the Viceroyalty of Bactria. Even after Vahyazdāta's expeditionary force had been headed back by Vivāna's pursuing column out of Gādāra into Harahvatiš, the invaders turned and fought a second battle, this time on Arachosian soil, at Gandutava; and, after that, they marched on the capital of the Arachosian viceroyalty, Aršādā,³ itself, and had arrived there before Vivāna was able to catch up with them again and to take them prisoners.

If any man other than Darius himself could claim to have won Cyrus II's imperial crown for the Ariaramnan branch of the Achaemenidae, that man was Vivāna; and Darius showed his recognition of the loyalty of the Eastern Paktyes and their viceroy in the year of his ordeal by extending this viceroyalty's area to include not only Zrāka but also the three disaffected Persian cantons in Kirmān and Lāristān—Asagarta, the Yautiyā, and Maka—and even the Median deportees who had been marooned on the islands in the Persian Gulf off the Maka coast.⁴ Yet it could have been said of the Paktyes who had fought so effectively for Darius in 522–521 B.C., as aptly as it actually was said of the Croats who fought for Francis Joseph in A.D. 1848–9, that the loyalists received from the Emperor as their reward what the rebels received as their punishment;⁵ for the enlargement of the viceroyalty of Harahvatiš was accompanied by an assessment of the corresponding taxation district—No. 14 in the Herodotean gazetteer—at the figure of 600 talents. The exorbitancy of this assessment on a district consisting of little else than steppes, mountains, and deserts is indicated by a comparison with the figure of 700 talents which was Darius's assessment on Egypt. As far as the three disgraced Persian clans and the deported Median offenders were concerned, this assessment was, no doubt, intended to be penal; but, in giving us the aggregate figure, Herodotus leaves us in the dark as to the quota which the loyal Harahvatiš and Zrāka had the honour to be invited to contribute.

As for the *Mačiyā* (Mykoi), their name cannot have been associated

Kanishka's name will have commemorated the future emperor's birth or upbringing in a Kānīš which will have reverted by his day to its pre-Hellenic appellation. Pliny's statement, in his *Historia Naturalis*, Book VI, chap. xxiii (xxv), § 92, that Kāpiša (*Latine* Capisa) had been destroyed by Cyrus I indicates that it was he who had annexed the Kābul Basin (Gādāra) to the Achaemenian Empire.

¹ See the passage of Strabo's *Geographica* cited on p. 635, n. 1, above.

² An account of Captain John Wood's passage of this Pass of Khawak, from the Oxus Basin into the Panjshir Valley, in April 1838, will be found in his *A Journey to the Sources of the Oxus*, new ed. (London 1872, John Murray), pp. 272–5.

³ The Elamite text of 'DB', § 47, informs us that Aršādā was the seat of Vivāna's administration. Tarn, in *The Greeks in Bactria and India*, pp. 94 and 470, locates it in the neighbourhood of the latter-day Qal'at-i-Ghilzai on the River Tarnak, north-east of Qandahar.

⁴ See Herodotus, Book III, chap. 93, and the present Annex, pp. 602 and 623, above.

⁵ See V. v. 293, n. 2, and p. 114, with n. 6, above.

in Ariaramnan Achaemenid minds with such unpleasant memories as the names of the Yautiyā and the Asagartiyā, considering that either they themselves or their country, Maka, are mentioned in every one of the six official lists. At the same time, the Mačiyā cannot have emerged from the ordeal of 522–521 B.C. with an altogether clean bill of political health, or they would not have been sentenced to share with the Yautiyā and Asagartiyā the punishment of being degraded to the status of tax-paying subjects.

The two cantons Yautiyā (Outioi) and Maka (Mykoi) can both be located approximately. Vahyazdāta's native city Tāravā¹ had bequeathed its name to a latter-day Tārum on the eastern edge of Lāristān. The mountain (*kaufa*) called Parga, where he made his last stand,² must be one or other of the twin cities Burk, standing on a hillock like a camel's hump, and Furg, with its castle on a hill, which were still in existence in the 'Abbasid Age.³ Maka (Mykoi) was commemorated in the 'Abbasid Age in the place-name Māhān on the road running north-westward from the port of Huzū, on the Lārī coast opposite Qays Island, to Laghir *en route* for Shīrāz.⁴ In the twentieth century of the Christian Era the name still survived on the Lārī coast itself at Mughan, near the mouth of the Darghaband River, and at Maghu or Mughu farther east, near the Lārī coast's southernmost point.

The islands on which the Median deportees were marooned were presumably those strung along the same coast, of which Kishm was the largest and Hormuz the only one that was eventually to become a famous name. In settling these disaffected Medes here, Darius was, no doubt, consciously achieving two purposes simultaneously. He was interning dangerous ex-rebels in a chain of prisons, provided for him by Nature, where they would be impotent to do any more mischief to his régime; and, in the act, he was confirming the hold of his empire upon one of its frontages on the Indian Ocean by planting penal settlements on islands that were too uninviting to attract voluntary colonists.⁵ The choice of these islands as the places of internment for irreconcilable rebels was all of a piece with the opening up of a continuous water-route from the Indus-port Kaspapyros to the head of the Red Sea, and with the reopening of the canal from the head of the Red Sea to the Mediterranean via the Nile. These three measures must have been so many parts of a comprehensive plan for securing the command of the Indian Ocean and thereby obtaining a water-route round Arabia to supplement

¹ 'DP', § 40.

² 'DP', § 42.

³ See Le Strange, *op. cit.*, p. 292. 'The *Fārs Nāmah* writes the name Purk or Purg' [compare the Greek word 'pyrgos'—A.J.T.] 'and says that its castle was impregnable, being built of stone and very large.'

⁴ See *ibid.*, p. 257, n. 1.

⁵ Darius's Median deportees were not the only *déracinés* to be marooned on these islands. For example, Megabyzus, the Persian general who had reconquered Egypt for the Achaemenian Empire after the insurrection led by Inarôs, was exiled by Artaxerxes I to the Persian Gulf, where he was interned in a place called Cyrtae (see Ctesias: *Persica*, Books XIV–XVII, § 71 (40) in J. Gilmore's edition (London 1888, Macmillan), p. 154). In this context, Ctesias uses the same word as Herodotus: '*déraciné*' (*Graecé* 'anáspastos'). The survivors of the sack of Miletus in 494 B.C. were deported, not to the islands, but to the mouth of the River Tigris on the gulf coast of Babylonia (Herodotus, Book VI, chap. 20).

the long and devious land-route between the eastern and western extremities of Darius's empire.¹

The two peoples—*Southern Parikanioi* and *Asiatic Ethiopians*—who, in the Herodotean gazetteer, together constitute Taxation District No. 17, do not either of them figure in any of the official lists, and they are not associated with one another in the Herodotean field-state. The Parikanioi are paraded here in Pactyan equipment under a separate command of their own;² the Asiatic Ethiopians are brigaded with the Indoi.³ The survival of the name 'pairikās' ('heathen')⁴ in the place-name Fārghān 60 kilometres to the east of Tārum and 120 kilometres to the north of Bandar 'Abbās, under the shadow of a Mount Furghun, was evidence, as we have already noticed,⁵ that these Southern Parikanioi were the Outians' (Yautiyā's) immediate neighbours towards the east. Their country will have been the south-eastern extremity of Kirmān and the western part of Makrān; and the eastern part of Makrān, between the Southern Parikanioi and Sind, will have been the country of 'the Asiatic Ethiopians'. We may presume that this district was annexed by Darius at or after the date of his annexation of Sind, as part of his policy of giving his empire a frontage on the Indian Ocean. While he made it a separate administrative unit for fiscal purposes, he will have attached it for political purposes either to the Viceroyalty of Harahvatiš or to Hīduš. In A.D. 1952 the first of these two possibilities seemed the more likely on considerations of geographical convenience, which was all that a historian then had to go upon, in the absence of documentary evidence on the point.

In the South-Eastern Quarter of the Achaemenian Empire the predominant culture was the Pactyan, to judge from the adoption of the Pactyans' equipment by their neighbours and administrative associates the Kaspioi, Outioi, Mykoi, and Parikanioi. On the same test we shall conclude that the Bactrian culture was predominant in the North-East, and that this culture was an offshoot of the Median; for the Bactrians are paraded in a sub-Median equipment,⁶ and this Bactrian equipment

¹ In this enterprising and far-sighted combination of measures, Darius showed a more lively sense of the importance of sea-power in the Indian Ocean for an empire strung out athwart the Middle Eastern land-bridge than was shown in the sixteenth century of the Christian Era by the 'Osmanlis when they gave way in the Indian Ocean to the Portuguese. The counterpart, in the Mediterranean, of the voyage of exploration into the Indian Ocean on which Scylax of Caryanda was sent by Darius was the commission given by him to Dēmocédēs of Crētōn to conduct a squadron on a corresponding voyage of exploration into Dēmocédēs' own native waters. This Mediterranean expedition of Darius's was abortive (see Herodotus, Book III, chaps. 135–8), but it is further evidence of Darius's sea-mindedness; and the story of Sataspes' attempt to circumnavigate Africa from the Mediterranean coast of Egypt via the Straits of Gibraltar (see Herodotus, Book IV, chap. 43) shows—though this enterprise, too, ended in failure—that Darius had bequeathed his sea-sense to his son and successor Xerxes.

² Herodotus, Book VII, chap. 68.

⁴ See p. 595, above.

³ Ibid., chap. 70.

⁵ On p. 617, above.

⁶ See Herodotus, Book VII, chap. 64. According to Herodotus, Book VII, chap. 61, the three distinctive features of the Median equipment were a soft felt cap, trousers, a dagger suspended from a belt and worn on the right thigh, and 'the great bow'. This description exactly corresponds to an equipment portrayed on the Achaemenian bas-reliefs as being worn by one of the two imperial peoples, and from this it follows that the other imperial people's equipment, as portrayed on the bas-reliefs—namely a taka (*Gallicé* toque) instead of a soft tiara ('Phrygian cap'), and an ample robe instead of a riding coat and trousers—must be the national dress of the Persians. Herodotus tells us

is worn by the Parthians, Chorasmians, Sogdians, Gandarians, and Dadicae, while the Areioi are equipped partly Bactrian fashion and partly Median fashion.¹

When we go on to compare the grouping of the north-eastern peoples in viceroyalties and taxation districts with their grouping in military commands, we find that in the North-East, as in the South-East, the military and civilian organizations do not coincide. For example, the inhabitants of Hyrcania (*Varkāna*), who in the Achaemenian Age were, for civil administrative purposes, so subordinate an element in the Viceroyalty and Taxation District of Parthia (*Parthava*) that their name is not mentioned either in the official lists or in the Herodotean gazetteer, though it figures in Darius's narrative of the events of 522-521 B.C., are paraded in the field-state under a separate command and in Median equipment,² in contrast to the Bactrian equipment of the Parthians; and the Sogdians likewise appear here under a separate command, though in every one of the six official lists they are associated with the Bactrians. Conversely the *Sakā Haumavargā* of *Farghānah* are brigaded with the Bactrians in the field-state, though *Farghānah* and *Bactria* were not contiguous (*Sogdiana* lay in between), and though the *Sakā Haumavargā*, who were allies of the Achaemenian Empire, differed in status from the Bactrians, who were tax-paying subjects. The Chorasmians (*Hvārazmiyā*), again, are brigaded with the Parthians, though *Khvārizm* and *Parthia* were insulated from one another territorially by the *Qāra Qum* Desert and by the *Dahā* in *Transcaspia*.

The civil, as well as the military, administrative geography of the North-East Quarter is fairly clear. The Viceroyalty of *Parthava* (*Parthia*)—with which the Herodotean Taxation District No. 16 will have been coextensive—touched the south-east corner of the Caspian Sea in *Varkāna* (*Hyrcania*). To the north it included *Hvārazmiš* (alias *Hvārazmiy*; *Latinè* Chorasmia, *Arabicè* *Khvārizm*), along the lower course of the River Oxus (*Amu Darya*); and the Viceroyalty of *Parthava* must therefore also have included the *Dahā*, whose name—though it is mentioned in the Achaemenian official lists only in 'XPh' was still extant in the 'Abbasid Age in *Dihistan*³ at the western end of *Transcaspia*. *Parthava* (*Parthia*) Proper was approximately coterminous with the latter-day provinces of Western *Khurāsān* and *Kuhistan*; and the viceroyalty extended, east of that, to include *Haraiva* (*Graecè* the *Areioi*, who had bequeathed their name to the city of *Herat*), but not

in Book VII, chaps. 61-62, that, on active service at any rate, the Persians wore the more practical Median dress, and that the *Kissioi* (? i.e. the Persian troops from *Parsuwaš*) did likewise, except for retaining their native headgear the mitre (perhaps this was a *taka* with a low crown). The Bactrians were not armed with the Median 'great bow', but they did wear the Median cap (see *ibid.*, chap. 64). This cap was also worn by all the Eurasian Nomad peoples, from the *Sakā Haumavargā* in *Farghānah* to the Scyths on the Great Western Bay of the Eurasian Steppe, except for the 'Pointed-Hood' *Massagetae*; and we may guess that, whatever may have been the origin of the cap, the wearing of trousers had been taken over by the Medes from the Nomads when they were learning from them the art of riding a war-horse instead of driving him in a chariot.

¹ See Herodotus, Book VII, chap. 66. The *Areioi* are armed with the Median 'great bow', not with the Bactrian 'reed bow', but are equipped like the Bactrians in other respects.

² Herodotus, Book VII, chap. 62.

³ See Le Strange, *op. cit.*, pp. 379-81.

Mārguš (Merv), which belonged to the viceroyalty of Bactria,¹ and *a fortiori* not Suguda (Sogdiana), whatever Herodotus may say.² Finally, on the south-east, the Viceroyalty of Parthava had, as we have seen,³ included Zrāka, on the north-east shore of the Hamun-i-Hilmand, before the transfer of Zrāka to the Viceroyalty of Harahvatiš.

The Viceroyalty of *Bākhtriš* (Bactria)—with which the Herodotean Taxation District No. 12 will have been coextensive—included Bākhtriš Proper and *Suguda* (alias Sugda; the Sogdoi). Bākhtriš Proper, which had bequeathed its name to the city of Balkh, lay between the south bank of the River Oxus (Amu Darya) in the middle section of its course and the northern flank of the Hindu Kush. Suguda (Sogdiana) stretched north-eastwards from the north bank of the Oxus, opposite Bactria, to the south bank of the southern elbow of the River Jaxartes (Sir Darya), where Suguda marched with the Hauma-(?)drinking Sakā's country in Farghānah.⁴ The heart of Sogdiana was the valley of 'the golden river' whose Old Persian name—translated into Greek as 'polytimētos', 'the precious', by the post-Alexandrine Hellenic geographers—had survived, down to the time of writing, as the Zarafshan on whose banks stood the latter-day cities of Samarqand and Bukhārā.

The *Sakā Haumavargā* (Sakai Amyrgioi)⁵ adjoining Suguda in Farghānah⁶ were under the Viceroy of Bactria's supervision, to judge by the fact that they are brigaded with the Bactrians both in Herodotus's field-state of Xerxes' expeditionary force and in Arrian's field-state of the army assembled by Darius Codomannus at Gaugamela in 331 B.C.;⁷ but they were the Achaemenian Empire's allies, not its subjects,⁸ and

¹ See 'DB', § 38.

² See pp. 595–6, above.

³ On pp. 589 and 637, above.

⁴ These boundaries are given, on the authority of Eratosthenes, by Strabo in his *Geographica*, Book XI, chap. viii, § 8 (C 514).

⁵ This 'Amyrgioi', to which the Iranian compound epithet 'Hauma-vargā' has been contracted in its rendering into Greek, may be compared with 'Aspourgianoī'—a people located by Strabo (*Geographica*, Book XI, chap. ii, § 11 (C 495), and Book XII, chap. iii, § 29 (C 556)) on the north-east coast of the Black Sea, at the mouth of the River Kuban, whose name, as it appears in Greek, presumably represents an Iranian 'Aspavargā'. If the Old Persian root *vargā-* means 'pressing out' or 'drinking' (see the note by Professor R. G. Kent on p. 587, above), 'Aspavargā' would be a label for a Eurasian Nomad people who milked mares or who drank qumiz. On either of these two conjectural interpretations, 'Aspavargā' and 'Haumavargā' would be complementary terms by which the Sakā would be classified according to the difference of the source from which they extracted their indispensable intoxicant. While the Sakā Aspavargā would be continuing to extract it from mare's milk, the Sakā Haumavargā would have learnt to extract it from a plant growing in the Central Asian highlands into which they had been driven by the pressure of more powerful hordes on the steppes.

See further Rostovtzeff, M.: *Iranians and Greeks in South Russia* (Oxford 1922, Clarendon Press) for the Aspourgianoī (pp. 152 and 160) and for Aspourgos, son of Asandrokhos, who became king of the Kingdom of the Cimmerian Bosphorus towards the end of the last century B.C. (pp. 152–3, 156, 166).

⁶ Sogdiana was bounded on the east by the farther bank of the Jaxartes (i.e. the north-western bank above the southern elbow) as far as the river's sources, according to Ptolemy: *Geographia*, Book VI, chap. xii, § 1.

⁷ See Arrian: *Expedition Alexandri*, Book III, chap. viii, § 3.

⁸ Bessus, the viceroy of Bactria, was in command of 'the Indoi who were next-door neighbours of the Bactrians', besides commanding the Bactrians themselves and the Sogdians. 'Brigaded with Bessus's command were the Sakai—one of the Asiatic Scythian peoples—but, unlike the other three peoples, these Sakai were not subjects of Bessus's, but were serving because they were Darius's Allies' (Arrian, *ibid.*). According to Ctesias, Books X–XI, § 38 (7) in J. Gilmore's edition (London 1888, Macmillan), pp. 135–6, this alliance had been contracted with the Sakā Haumavargā (Sakai Amyrgioi) by Cyrus II.

this status is perhaps described in the name 'Aiglai' by which Herodotus refers to them without recognizing who these 'Aiglai' were; for Herodotus's word 'Aiglai' recurs in Ptolemy's 'Augaloi'¹ and perhaps also in the 'Augasioi' whose name was found by Stephanus in his text of Strabo's *Geographica*, Book XI, chap. viii, § 8 (C 513), where the reading had subsequently come to be 'Attasioi' in the text that had reached the hands of Modern Western scholars. It had been conjectured by Tomaschek that these were three independent attempts to reproduce in Greek an Iranian word 'aogazdáo', which would have been a derivative of the Avestan word 'aogañh', meaning 'strength',² and which might therefore have been coined to designate 'reinforcements', 'auxiliaries', 'allies'. The location of Ptolemy's 'Augaloi', as well as their name, would fit the Achaemenian Empire's Hauma-(?)drinking Sakā allies in Farghānah; for Ptolemy places them 'below' (i.e. south of) the Iatioi (i.e. the Jāts, *alias* Massagetae, *alias* 'Pointed-Hood Sakā') and the Takhoroi (i.e. Tokharoi); and he places these Iatioi and Takhoroi on the northern section of the Jaxartes (i.e. around and down stream from Tashkend).³

As for the *Sakā Tigrakhaudā* (the Pointed-Hood Sakā), whom Herodotus knows by their national name as Massagetae, they were presumably neighbours of the Sakā Haumavargā, since in the official lists 'DB' and 'DPe' the Sakā are mentioned simply as such, without any attempt to draw the distinction between two different kinds of Sakā that is drawn in all four later lists. According to Herodotus⁴ the Massagetae marched with the Achaemenian Empire along the Oxus at the time when Cyrus II made his disastrously unsuccessful attempt to conquer them. Herodotus's description⁵ of the marshes and lagoons in which all branches of 'the Araxes' lose themselves, except for one solitary branch that finds its way to the Caspian Sea, shows that 'Araxes' must mean 'Oxus' in this context; and his description of the denizens of these marshes⁶ corresponds to the label by which, in 'DZd', 'the Sakā of the Marshes' are distinguished from 'the Sakā of the Plains'. There is, however, no evidence that either Herodotus's 'marshmen' or Darius's 'Sakā of the Marshes' are to be identified with the 'Water Sakā'—'Apa Sakā', *Graecè* 'Apasiakai'—whom Polybius⁷ describes as a mounted Nomad people, living between the rivers Oxus and Don, who have to cross the Oxus in order to raid Hyrcania.

¹ Ptolemy: *Geographia*, Book VI, chap. xii, § 4.

² Professor R. G. Kent comments: 'It is very hazardous to see in Greek Aiglai, Augasioi, Augaloi a Grecizing of Avestan aogaz-da—(so properly transcribed), meaning 'strength-giving or -making' (roots dō- and dhē- are phonetically merged into one, dā-, in Iranian). The compound does not actually occur in the *Avesta*, but its form would be certain. If you cite the Avestan word for strength, it should be aogah- (from auges-), which is more perspicuous. The use of ñh for Avestan s > h between vowels is no longer current, as it develops only in certain intervocalic positions, while -h- is its phonetic antecedent even there. In the Greek words the Ai- and the Au- are difficult to equate, even as corrupt borrowings: unless there is some popular etymology to a more familiar word, or to something that seems to make meaning.'

³ These locations for the Sakā Haumavargā, the Sakā Tigrakhaudā, and the Tokharoi are evidently those which they had occupied at the moment when the Tokharoi (*alias* Yuechi) had just been pushed westward out of the country of the Issedones (Wusun).

⁴ See Herodotus, Book I, chap. 201.

⁵ See *ibid.*, chap. 202.

⁶ In loc. cit. Cp. Strabo: *Geographica*, Book XI, chap. viii, § 7 (C 513).

⁷ See Polybius, Book X, chap. 48.

These Apasiakai are located in what would appear to be the same position—along the Oxus west of Bactria—by Eratosthenes, according to Strabo, if we accept Tarn's emendation of the passage;¹ and here the Apasiakai are associated with the Massagetae. Ptolemy brings the Massagetae south of the Oxus, into Margianê (Marguš).² Darius tells us³ that, in the campaign in which he re-subjected the insurgent Sakā whose prince was Skunkha, he had to cross the sea. We know, from the evidence of the head-dress worn by Skunkha on the Behistan bas-relief, that Skunkha's Sakā were 'the Pointed-Hoods' and not 'the Hauma-(?) drinkers'; and, since Herodotus's and Eratosthenes' location of the Massagetae somewhere along the right bank of the Oxus suggests that the sea which Darius had to cross in order to get at them must have been an arm of the Sea of Aral, we can perhaps locate the south-eastern borders of 'the Pointed-Hood Sakā', *alias* Massagetae, as adjoining the Oxus from a point below the western frontiers of Bactria and Sogdiana to some point as far north-west as the south-eastern extremity of Choras-mia, and their western borders as adjoining the Sea of Aral; but we do not know how far this great confederacy of Nomad peoples extended northwards into the heart of the Eurasian Steppe, or at what point on the course of the Jaxartes, to the north and north-west of the river's southern elbow, they marched with the Sakā Haumavargā. We can, though, be sure that, in addition to the Apa Sakā on the Middle Oxus and the marshmen in the Oxus Delta, there were other Massagetan peoples who, like the Sakā Haumavargā, were 'Sakā of the Plains' in fact, whether or not this latter label is used in 'DZd' to designate the Sakā Haumavargā exclusively.⁴

A link between the North-East Quarter of the Achaemenian Empire and its dominions in the Indus Basin was constituted by the *dahyāuš* which is called *Gādāra* in the Old Persian version, and *Pa-ar-ū-pa-ra-e-*

¹ See Strabo: *Geographica*, Book XI, chap. viii, § 8 (C 513), as amended by Tarn in *The Greeks in Bactria and India*, p. 91, n. 3, to read: 'And Eratosthenes says that the Apasiakai (*sic*, instead of 'the Arachōtoi') adjoin the Bactrians on the west along the Oxus.'

² See *Geographia*, Book VI, chap. x, § 2.

³ In 'DB', in the tantalizingly mutilated § 74.

⁴ If the Achaemenian imperial authorities found some difficulty in hitting upon labels or nicknames to distinguish 'the Hauma-(?)drinking Sakā' who were their allies from 'the Pointed-Hood Sakā' who were at least nominally their subjects, it is not surprising to find the Hellenic geographers confounding the two kinds of Sakā with one another. After accurately distinguishing 'the Heathen' ('Parikanioi') from 'the Pointed-Hoods' ('Orthokorybantioi') in his gazetteer without realizing that these two outlandish names that he is cramming into one of his four Median taxation districts have anything to do with the Sakā (see pp. 594-5, above), Herodotus falls, in his field-state (Book VII, chap. 64), into the blunder of identifying the Sakā who wear stiff pointed hoods with the Sakā whom the Persians call 'Amyrgioi' (i.e. 'Haumavargā'). On the other hand, Strabo is not conclusively convicted of being guilty of the same blunder when he states that Spitamenes, when Alexander had made Bactria and Sogdiana too hot to hold him, 'sought asylum with the Augasioi (*sic*, following Stephanus, instead of "Attasioi") and the Khorasmioi, who were two of the peoples belonging to the nation of the Massagetai and the Sakai' (*Geographica*, Book XI, chap. viii, § 8 (C 513)). Spitamenes may have taken refuge with the Augasioi (*alias* Sakā Haumavargā of Farghānah) first, and then moved on to the country of the more distant Khorasmioi; and this second asylum would have been safer politically, besides being more remote geographically, than the first, if at this date the Khorasmioi had become 'one of the peoples of the Massagetai' in the sense that they had transferred their allegiance from a declining Achaemenian Power to the formidable Nomad confederacy against which a now decrepit Achaemenian Imperial Government had ceased to be able to protect them.

sa-an-na in the Babylonian version, of the official lists, and *Gandarioi* in Herodotus's catalogue of the peoples in his Taxation District No. 7. The Babylonian synonym for an Old Persian 'Gādāra', which reappears in the post-Alexandrine Hellenic name 'Paropanisus', had been interpreted by Modern Western scholars, in terms of the language of the *Avesta*, as meaning [the country which is] 'beyond' ('para') [the mountain range that is] 'higher than the eagle' ['upāirisaēna'], i.e. the country that is 'trans Hindu Kush'. Since this poetic geographical expression must have been coined by speakers of the Avestan language in which it is couched, it must have designated people who lived on the opposite side of the Hindu Kush from the Oxus Basin, and this locates these 'Para-upāirisaēna' in the basin of the Kābul River. This was the location of Gādāra likewise; and the prima-facie inference from the official equation Gādāra = Para-upāirisaēna in the Achaemenian official lists is that, in the Achaemenian Age—whatever permutations and combinations in the administrative geography of this region may have been inaugurated by the Macedonian conquest¹—the two names were synonyms for an identical administrative area in the Kābul River Basin.² Besides the Gandarioi, however, Herodotus, in his description of his Taxation District No. 7, mentions three other peoples whose homes we still have to locate.

Two of these other three peoples in the Herodotean District No. 7 could be identified through the survival of their names down to the time of writing. Herodotus's *Dadikai* were still on the map as the Tajiks who were to be found in the Kābul River Basin in the Kuh-i-Dāmān, between the Upper Kābul River and the Panjshir River, and in the Kuhistan, between that and the Hindu Kush,³ as well as in the Upper Oxus Valley above Bactria and Sogdiana—on the left bank in Badakhshān and on the right bank in the territory that had been labelled Tajikistan in the administrative geography of the Soviet Union.⁴ Herodotus's *Aparytai* ('highlanders')⁵ were still on the map as the Afridis who were to be found at the eastern end of the Safid Kuh, on the watershed between the Kābul River and the Kurram River, just to the south of the Khyber Pass.⁶

¹ See, for instance, Tarn, *op. cit.*, p. 100.

² These 'Paropanisadae', *alias* 'Gandarioi', must be the people described in Arrian's field-state of Darius III Codomannus's army at Gaugamela (III. viii. 3) as 'the Indoi who were next-door neighbours of the Bactrians' and who were brigaded with the Bactrians under Bessus's command (see p. 644, n. 8, above).

³ See Elphinstone, M.: *An Account of the Kingdom of Caubul*, new ed. (London 1839, Bentley, 2 vols.), vol. i, pp. 408–11; Burnes, A.: *Cabool: A Personal Narrative of a Journey to, and Residence in, that City in the Years 1836, 7 and 8*, 2nd ed. (London 1843, John Murray), pp. 149–51.

⁴ We have no information about the boundary between the Dadikai—in the administrative, as distinct from the ethnic, sense—and Bactria in the administrative geography of the Achaemenian Empire. Ptolemy's statement (in *Geographia*, Book VI, chap. xii, § 1) that Sogdiana was bounded 'by Bactria and the Caucasian Mountains Proper' not only on the south along the Oxus River and on the west (i.e. by the Bactrian province Margiana), but also on the east, may signify that the Upper Oxus Valley on the north bank, and consequently also on the south bank, was included in Bactria, not in Dadikē.

⁵ According to Herzfeld, *op. cit.*, p. 99, 'parvatā' was one of the Iranian words for 'mountain'. Professor Kent notes that the word 'parvatā', with epenthesis to 'paurvatā—', is extant in Avestan.

⁶ These 'Aparytai' must be the people described in Arrian's field-state (III. viii. 4) as 'the Indians called the highland Indians' who in 331 B.C. were brigaded, not with

Neither of these peoples is named in any of the official lists; but the fourth people included in the Seventh Taxation District according to the Herodotean gazetteer are the *Sattagyđai* who appear in the official lists as the *Thatagu*[? *d* or *v*]iyā; and *Thataguš*, the *dahyāuš* from which this people derive their name, is not so easy to locate. Considering that Para-upārisaēna = Gādāra Proper had immediate next-door neighbours on the north in Bactria, on the west in Areia, and on the south in Arachosia, we are led to look for the *Thataguš* canton of the Herodotean Taxation District No. 7 in the country immediately to the east of Gādāra Proper—i.e. in the Panjab, which adjoined Gādāra across the Indus.¹ Herzfeld points out² that in the Achaemenian bas-reliefs the *Thatagu*[? *d* or *v*]iyā are portrayed in loin-cloths, which indicates that their country lay somewhere on the plains of the Indus Basin, and not up in the highlands of Eastern Iran; and the difficulty of finding a location for *Thataguš* anywhere within the limits of Gādāra to the west of the Indus certainly suggests that the *Thatagu*[? *d* or *v*]iyā must have lived to the east of the Indus—that is to say, on the plains, extending south-eastwards from the east bank of the Indus opposite the mouth of the Kābul River, which were watered by seven streams, from the Indus to the Sutelj's lost south-eastern neighbour inclusive.³

the Gandarians, but with the Arachosians under the satrap of Arachosia's command. In Ptolemy's *Geographia*, Book VI, chap. xviii, Herodotus's 'Aparytai' appear as the 'Parouētai' (*sic*, instead of the reading 'Parsuētai' in the latter-day text) who are the southernmost community of the Paropanisadae (§ 3) and who are presumably the inhabitants of the Parouētan Mountains (the latter-day Safid Kuh) that constitute the boundary between the Paropanisadae and Arachosia, since they also figure (*ibid.*, Book VI, chap. xx, § 3) as the northernmost community in Arachosia. This location on the border would account for their transfer to Arachosia from Gādāra at some date before 331 B.C. Ptolemy's 'Parautoi' (Book VI, chap. xvii, § 3), who are located in Areia next door to the Paropanisadae, are evidently likewise 'highlanders' Hellenized in a slightly different transliteration of the same underlying Iranian word, but their location suggests that their highland home lay in the country of the latter-day Hazaras, on the watershed of the rivers Kābul, Hilmand, and Hari Rud, and not in the Safid Kuh, where the name 'Aparytai-Parouētai-Parautoi' was still borne by the latter-day Afridis.

¹ The only substantial objection to locating *Thataguš* in the Panjab is a financial one. The Panjab must always have been a rich country in virtue of its agricultural and pastoral products, and therefore, if the Herodotean Taxation District No. 7 did include even only a part of the Panjab, it is surprising that it should have been assessed at a lower figure than any other district. Moreover, *Thataguš*, whether a rich country or a poor one, had been in rebellion in 522–521 B.C., and Darius was not the man to let off re-subjugated rebels lightly in their tax-assessments, as he showed by the enormous figure at which he assessed the poverty stricken South-Eastern Asagartiyā, Yautiyā, and Mačiyā. The lowness of the assessment on the Herodotean District No. 7 could perhaps be reconciled with a location of one of its constituent cantons in the wealthy Panjab on the supposition that, if *Thataguš* did lie in the Panjab, it included no more than a fraction of it—e.g. the north-western corner, to the north-west of the Salt Range.

² In *op. cit.*, p. 99.

³ i.e. the Indus, Jhelum, Chenāb, Rāvi, Beas, and Sutelj, together with a former river, south-east of the Sutelj, adjoining the Indian Desert, that had subsequently dried up. This lost river was remembered under divers names: 'Hakrā' and 'Wahindah' (see Smith, V. E.: *The Early History of India*, 3rd ed. (Oxford 1914, Clarendon Press), p. 92) and 'Sarasvati' (see Rapson, E. J., in *The Cambridge History of India*, vol. i, p. 45). The Panjab is designated accordingly as the land, not of five, but of seven, rivers in the Avestan gazetteer of the Zoroastrian World (*Vendidad*, i. 18), as well as in the *Vedas* (e.g. in *Rigveda*, viii. 24 and 27). The 'Haptā Hindu' of the *Avesta* and the 'Saptā Sindhava' of the *Vedas* are philological equivalents of one another; and Herzfeld, in *loc. cit.*, taking this figure 'seven' as his cue, suggests that the name reproduced in Old Persian as 'Thataguš' may represent a compound, in some Iranian or Sanskrit dialect, of the Indo-European word for 'seven' with some word meaning 'stream'. The identification of the Haptā Hindu of *Vendidad*, i. 18, with the Panjab is corroborated by the

This conclusion will be supported by our finding that, if we do not locate Thataguš here, we shall be left with a vacuum in a piece of territory that can hardly have lain outside the frontiers of an Achaemenian Empire which, before the end of Darius I's reign, had come to include not only the basin of the Kābul River down to the west bank of the Upper Indus but also the Lower Indus Valley as far north as a point where *Hīduš* (Indoi)—the Herodotean Taxation District No. 20—marched with Harahvatiš ('the Pactyan country'). In one of the appendices to his gazetteer, Herodotus¹ tells us, as we have already noticed,² that the northernmost of all the Indoi were next-door neighbours of the city of Kaspatyros and the Pactyan (not the Gandarian) country on the one hand and next-door neighbours of the Indian Desert on the other; and this means that, at the farthest, *Hīduš* (Indoi) cannot have extended farther north than the southern extremity of the Panjab, i.e. than the neighbourhood of the latter-day city of Multān. Darius must have annexed the Lower Indus Valley from this point downwards to the sea as part of his comprehensive plan for opening up through communications by water, via the Indus, the Indian Ocean, the Red Sea, his Red Sea-Nile canal, and the Eastern Mediterranean, between the eastern and western extremities of his empire.³

The name *Hīduš* (Indoi) means the country of the people known as the Sindhu or Sauvira-Sindhu in Sanskrit literature. These had 'entered India shortly before the Persian period and worked southwards',⁴ and both the date of their arrival and the contemporary occurrence of another people bearing the name Sindoi on the banks of the River Kuban, in the throat of the Great Western Bay of the Eurasian Steppe, suggests that the Indoi in Sind will have been the left wing of a Eurasian Nomad horde whose right wing will have diverged to the north of the Caspian Sea in the course of the Völkerwanderung of the eighth and seventh centuries B.C.⁵ In giving their name to the province of Sind and to the

description of it, in this passage of the *Avesta*, as being a region of 'abnormal heat' (see Jackson, A. V. W., in *The Cambridge History of India*, vol. i, p. 324); but, even if the identification of the Achaemenian 'Thataguš', too, with the Panjab were also to carry conviction, the countries called Hapta Hindu and Thataguš might be geographically identical without there being any common element in the etymologies of their names. A different interpretation of 'Thataguš' from Herzfeld's is given by Kent in his *Old Persian: Grammar, Texts, Lexicon*, p. 187:

'Θαταγυ- sb. "Sattagydia", a province of the Persian Empire: Elam. *sa-ad-da-ku-iš*, Akk. *sa-at-ta-gu-iš*, Gk. *Σατταγυδιᾶ* . . . From *Θατα*—"hundred", Av. *sata-*, Skt. *satām*, Gk. *ἑκατόν*, Lt. *centum*, N. Eng. *hundred*, PIE *kn̥to-m*, +*gav-* "cattle": "having hundreds of cattle" (hardly "[Land of] Seven Streams", with Hz. AMI 1.99n., 3.100-2, 8.73, König Ru 1D 63).

The name 'having hundreds of cattle' fits the Panjab as aptly as the name 'Land of Seven Streams', and thus there seems to be no etymological obstacle to the equation Thataguš = Panjab, which is commended by the negative geographical consideration that there is nowhere else where we can locate Thataguš, and by the positive indication that is to be found in the tropical dress in which the Thataguš? d or vīyā are portrayed.

Professor G. G. Cameron comments: 'I find it very difficult to reconcile Thataguš with the Panjab. Must it not rather be on the slopes of the Hindu Kush?' But, if that had been its location, would it not have had to be labelled 'having hundreds of sheep and goats'? And would not its denizens have had to be portrayed, not half-naked, but muffled up in *sisyrnai*?

great river by whose united waters this province was traversed, the left wing of the Sindoi will have started a process which was to end in their name being applied to the whole sub-continent embraced within the Sulaymān and Himalaya mountain ranges;¹ and we can already see the beginnings of this progressive extension of the name 'Indian' in Herodotus's usage.

While, in Herodotus's mind, the word 'Indoi' means in the first instance the nation inhabiting Darius's Twentieth Taxation District and living on the banks of 'the river' [Indus],² and while he believes that Sind is the eastern edge of the *Oikoumenē*,³ with nothing to the east of its inhabitants except the Indian Desert that set for them their eastern boundary, he also knows of Indians, living south of the Achaemenian province Hiduś, who were independent of Darius;⁴ he is aware that the Indians consist of many peoples not all speaking the same language;⁵ and, when, both in the gazetteer⁶ and in another context,⁷ he calls the Indians 'by far the largest nation in the World', he is manifestly using the word 'Indians' to cover not merely the Indoi in Sind but all the inhabitants of Sind's vast south-eastern hinterland, where, between the Indian Desert and the Arabian Sea, it passes over into Gujerat and Malwa and Mahārāshtra and the Deccan. On the other hand, Herodotus's location of 'the northernmost of the Indoi' no farther north than the latitudes of 'the Pactyan country' (i.e. Arachosia) and the Indian Desert, and his statement in this context that these were the Indoi who were sent to get from the Desert the gold⁸ in which the Indian taxation district paid its enormous annual contribution to the Achaemenian Imperial Treasury,⁹ show that, unlike the source from which Arrian ultimately obtained his field-state of the army assembled by Darius III Codomannus at Gaugamela a hundred years or so after the date at which Herodotus was writing, Herodotus did not reckon among the Indoi any of the peoples then in occupation of the Indus Basin to the north of Hiduś's northern boundary in the neighbourhood of Multān.¹⁰

In thus excluding from the limits of India Proper the Panjab as well as Gādāra, Herodotus was in agreement with the Sanskrit Scriptures; and there is a piece of evidence which suggests that, without knowing

¹ 'Sanskrit "Sindhu-s" and Old Persian "hi(n)duś" agree absolutely in etymology, as original initial s before a vowel became h in Iranian, and the aspirated voiced stops became voiced non-aspirates in Iranian. This explains the variation between Hind and Sind; "India" is from the Iranian with loss of the initial h.'—Professor R. G. Kent.

¹⁰ How was it that, at some date between the reigns of the first Darius and the last Darius, the name 'Indoi' came to be applied to the peoples in the basin of the Kābul River whom Herodotus calls 'Aparytai' and 'Gandarioi'? The explanation might be that Hiduś, after its annexation to the Achaemenian Empire by Darius, was attached for political purposes to the *dahyāuś* Gādāra to constitute a single vicerealty, though for fiscal purposes it was erected into a separate taxation district (Herodotus's District No. 20, which appears in his gazetteer as a separate unit from his District No. 7). If Gādāra was united with Hiduś for political purposes, this would account for the extension of the name 'Indoi' to the peoples in the Kābul River Basin, and for their retention of the name even after the rest of the Indus Basin, including the home of the authentic 'Indoi' in Sind, had recovered its independence—as it had before Alexander's descent upon it.

it, he may have been following Vedic authority through a chain of intermediate informants.

In describing the gold-getting Indoi who were the northernmost of all the peoples bearing the name, Herodotus states¹ that these were 'the most warlike of the Indians' and that their culture (*Graecè* 'dáita') was 'approximately the same as that of the Bactrians'. This must be an echo of the usage of the term 'Bāhlika' (i.e. 'Bākhtriś', 'Baktroi') in the Sanskrit Scriptures as a disapprobatory generic name—a counterpart of the Avestan term 'pairikās'—to cover the swarm of Eurasian Nomad peoples and the once sedentary victims of their invasion—including not only the Bactrians Proper (Bhallas), but also the Čibi (*Graecè* Sibai), Malavas (*Graecè* Malloi), Kshudrakas (*Graecè* Oxydrakai),² Madda, Maddava, Madra, Madraka, Bhadra, and what not—who, in the Völkerwanderung of the eighth and seventh centuries B.C., had poured out of the Eurasian Steppe into the Panjab and beyond, without troubling to legitimize themselves in Brahman eyes by conforming to the ritual demands of Vedic orthodoxy.³ The national names of these intruders are not mentioned either by Herodotus or in any of the Achaemenian official lists. They have been preserved in Sanskrit and in post-Alexandrine Hellenic literature. But it seems reasonable to surmise that, in the administrative geography of the Achaemenian Empire, they figure anonymously as the Thatagu[? d or v]iyā (Sattagyđai) together with those northernmost peoples of the Viceroyalty of Hīduś who were more Bactrian than they were Indian in their way of life.⁴

The name of one of these heathen Bāhlika peoples that looms large in Sanskrit literature, and that had been located in the Kābul River Basin by students of Indic history,⁵ is conspicuous by its absence from both the Achaemenian official lists and the Herodotean gazetteer. Where are the Kambojas? In Sanskrit literature they are described as living in a cold country and manufacturing warm clothes from wool and fur, and they are associated with the Yonas (Hellenes) by Açoka Maurya.⁶ These indications point to a location in the Paropanisus; and this is in fact Ptolemy's location⁷ of a people whom he calls 'Tambyzoi' and places on the southern frontier of Bactria, about half-way along. If we may conjecture that 'Tambyzoi' is a corruption of an original 'Kambyzoi', we learn from this passage of Ptolemy's *Geographia* that the national name which appears in Sanskrit as 'Kamboja' was transliterated into Greek on the same system as the personal name which appears in Old

¹ In Book III, chap. 102.

² A rearguard of these Oxydrakai who had made their way to the south-eastern edge of the Panjab is located by Ptolemy (*Geographia*, Book VI, chap. xii, § 4) in the mountains of Sogdiana under the name Oxydrankai.

³ See de la Vallée Poussin, L.: *L'Inde aux Temps des Mauryas* (Paris 1930, Boccard), pp. 12-16; Tarn: *The Greeks in Bactria and India*, pp. 169-71.

⁴ The portrayal of the Thatagu[? d or v]iyā in loin-cloths does not disqualify them from being reckoned among the Bāhlikas, since, as is evident from Elphinstone's account quoted on p. 636, above, of the dress of the nineteenth-century Afghan occupants of the Darajāt, an immigrant Central Asian people on the plains of the Indus Valley might revert to its ancestral dress in the winter even if it had taken to wearing a tropical undress in the summer.

⁷ In *Geographia*, Book VI, chap. xi, § 6.

Persian as 'Kambūjiya', in Elamite as 'Kan-bu-ši-ja', in Akkadian as 'Kam-bu-zi-ia', and in Greek as 'Kambysēs'.¹

The question remains: Why did Kambūjiya I's father Kūruš I of Parsuwaš and Anšan name his son 'the Kamboja'? And this question raises an antecedent one: Why did Kūruš I's father Čišpiš (*Graecè* Teispes) name his son 'the Kuru'?² It is evident that the personal names that thenceforth alternated in the Cyran, in contrast to the Ariaramnan, branch of the Achaemenidae are taken from the national names of two non-Persian peoples; but it seems improbable that Cambyses I of Parsuwaš-Anšan (*regnabat circa* 600–559 B.C.) can have been named after the Kambojas whom we find subsequently established on the southern flank of the Hindu Kush, and *a fortiori* improbable that Cyrus I of Parsuwaš-Anšan (*regnabat circa* 640–600 B.C.) can have been named after the Kurus whose 'plain', the 'Kuru-kshetra', is located in Sanskrit literature near the north-eastern edge of the Indian Desert, on the divide between the basins of the Indus and the Ganges.³

A clue to the solution of this problem may perhaps be found in the appearance of the same two words 'Kamboja' and 'Kuru' as place-names in Transcaucasia as well as on the Hindu Kush and in the Indian sub-continent. Sanskrit literature had preserved a memory of Uttara-Kurus living beyond the Himalaya;⁴ and at the time of writing the principal left-bank affluent of the River Aras was still called the Kur, while this River Cyrus, as it was likewise called by Hellenic geographers, had a left-bank affluent called by them the Cambyses, which gave the name 'Cambysēnē'⁵ to a north-western tongue of the steppe country, called by them Kaspianē,⁶ in the Lower Kur-Aras Basin. Thus in Transcaucasia the two names Cyrus (Kuru) and Cambyses (Kamboja) were not only both on the map, as they were in India and on its north-west frontier, but were found in immediate juxtaposition, which suggests that in

¹ A Modern Western scholar, Sylvain Lévi, cited by Tarn in op. cit., pp. 138 and 170, had tentatively equated the national name 'Kamboja' with the Paropanisadan place-name Kāpiša, one of the two constituents of the double city Kāpišakāniš (see p. 639, n. 3, above); but Professor R. G. Kent had pointed out to the present writer that in the Elamite usage of the cuneiform script—which, unlike the Old Persian usage, shows nasals before consonants, Old Persian 'Kāpišakāniš' is transcribed 'Qa-ap-pi-iš-ša-qa-nu-iš', in contrast to the Elamite rendering 'Kan-bu-ši-ja' for Old Persian 'Kambūjiya'. This Elamite testimony showed that there was no nasal in the initial syllable of the name Kāpiša, and this discrepancy told against Lévi's equation Kāpiša = Kamboja.

² See Weissbach, F. H., s.v. 'Kyros', in Pauly-Wissowa, *Realencyclopädie der Classischen Altertumswissenschaft*, Neue Bearbeitung, Supplementband IV, col. 1128.

³ There was another 'Kuru Plain' (*Graecè* Kyrou *alias* Kourou *alias* Korou Pedion) in Western Anatolia, round the confluence between the River Hermus and its right-bank tributary the Phrygius, just to the north of the city of Magnesia-under-Sipylus (for the location see Strabo: *Geographica*, Book XIII, chap. iv, § 5 (C 626) and § 13 (C 629); Beloch, K. J.: *Griechische Geschichte*, 2nd ed., vol. iv, Part II (Berlin and Leipzig 1927, de Gruyter), pp. 458–61). In Anatolia, as in Hindustan, 'the Kuru Plain' was a battlefield on which the political fate of a sub-continent was repeatedly decided. Kyroupedion was the scene of the overthrow of Lysimachus by Seleucus Nicator in 281 B.C. and of Antiochus III by the Romans in 190 B.C. Kuru-kshetra, between the River Jumna and the lost River Sarasvatī, was the historic battlefield of Pāṇipat, besides being the scene of the legendary war between the Kurus and the Pandus which is the theme of the *Mahābhārata*.

⁵ See Strabo: *Geographica*, Book XI, chap. iv, § 1 (C 501) and § 5 (C 502); chap. xiv, § 4 (C 528).

⁶ See pp. 627–8, above.

Transcaucasia the two peoples who thus stamped their national names on the local landscape must have been closely associated.

It is perhaps almost as unlikely that the Cyran Achaemenidae will have derived their personal names from a pair of peoples in Transcaucasia as it is that they will have derived them from two peoples in and near India. But the occurrence of the two names in Transcaucasia as well as in and near India—and in Transcaucasia at close quarters—indicates that we have here two more names of Eurasian Nomad peoples who took part, and this in one another's company, in the *Völkerwanderung* of the eighth and seventh centuries B.C.; and, if, like so many of their fellows, these Kurus and Kambojas split into two wings whose paths diverged so widely, it does not seem unwarrantable to guess that a central detachment of this pair of migrating peoples may have found its way to Lūristān and there have been taken into partnership by Kūruš I's father Čišpiš.

Čišpiš seems to have come, *circa* 670 B.C.,¹ under the suzerainty of a war-lord whom the Assyrian records knew as Kashtaritu (*Persicè* Khšathrita)² and located, at his first appearance, in the Kassite country³ just to the north-east of Parsuwaš. This Khšathrita was the leader of an anti-Assyrian coalition in which Medes and Mannaeans were associated with migrant Eurasian Nomads—Cimmerians and Saparda⁴—and the accommodation of a Kuru-Kamboja detachment of this horde in Parsuwaš may have been part of the arrangement on which Khšathrita and Čišpiš of Parsuwaš came to terms. The settlement of Eurasian Nomad immigrants in Lūristān is attested by the 'animal style' of the local school of bronze-work;⁵ and some such reinforcement of the Achaemenian Power would also account for the sudden vast extension of its domain, at some date during Čišpiš' (*Graecè* Teispes') reign (*regnabat circa* 675–640 B.C.), from Parsuwaš in Lūristān and Anšan in the Pusht-i-Kuh south-eastwards over Pārsa (Fars). Teispes himself, for that matter, was the namesake of the Cimmerian war-lord Teušpu who crossed swords with Teispes' Assyrian contemporary Esarhaddon (*regnabat* 681–668 B.C.),⁶ even if he was not Teušpu himself; and the folk-tale in which the mother of Cyrus I was called 'the bitch'—'Spakō'—according to Herodotus⁷ may reflect the memory of a dynastic marriage between the House of Achaemenes and the House of the Scythian war-lord Išpakai who was riding hard at the Cimmerians' heels.⁸

Whatever may be the correct historical interpretation of these Nomad names in the personal nomenclature of the Achaemenidae from Čišpiš

¹ See Cameron, *op. cit.*, p. 180.

² Esarhaddon's Khšathrita was identified by Modern Western scholars with Herodotus's Phraortes (i.e. Fravartiš) on the strength of Darius's statement, in 'DB', § 24, that another Fravartiš, the pretender to the Median throne in 522 B.C., gave himself out to be 'Khšathrita of the House of Uvakhštra (Cyaxares)'. (Teispes) onwards in the Cyran branch of the house, they must mean that the Cimmerians, the Kurus, the Kambojas, and the Scyths had played some part in Achaemenian history that had been auspicious as well as important.

Having now completed our review of the *dahyāva* to the east of Western Iran, the heartland of the Achaemenian Empire, we have next to survey the *dahyāva* to the west of the heartland. If we take ship at Kaspapyros, sail down the Indus out into the Indian Ocean, and then follow in the wake of Alexander's admiral Nearchus up the Persian Gulf, instead of following in the wake of Darius's admiral Scylax round Arabia, we shall come to port in the *dahyāuš* which is called *Bābiruš* in all the Achaemenian official lists, and *Babylonia* by every Hellenic geographer with the one exception of Herodotus, who, for some private reason of his own, systematically calls Babylonia 'Assyria'¹ (the ninth taxation district in his gazetteer).

In the South-West Quarter of the Achaemenian Empire, on which we have now set foot, the next *dahyāuš* to *Bābiruš* (Babylonia) is the *Asshur* of the Babylonian and *Athurā* of the Old Persian text of the official lists; and both the name and the area covered by it appear in Greek as the *Syroi*—defined as 'the whole of Phoenicia and the so-called Philistine Syria, together with Cyprus'—who constitute Herodotus's Taxation District No. 5.

The name 'Asshur', as applied to this *dahyāuš*, is manifestly the official term which, before the incorporation of the Neo-Babylonian Empire into the Achaemenian Empire, had been used in the Neo-

¹ It is certain that Herodotus does mean Babylonia by 'Assyria'. In the gazetteer, for instance, he writes 'Babylon and the rest of Assyria' in between 'Susa and the rest of the Cissians' country' and 'Ecbatana and the rest of Media' (Book III, chaps. 91-92). 'Assyria' must mean Babylonia here, and so it must likewise in the field-state, where he states that the Assyrian contingent included the Chaldaeans, who were, of course, in occupation of South-Western Babylonia at this date (Book VII, chap. 63). In another place he calls Nabonidus 'king of Assyria' (Book I, chap. 188), and in another he uses 'the Babylonian country' and 'the Assyrian country' as synonyms in consecutive sentences, and explains that he is talking about an official administrative area: a 'satrapy' in the sense of a viceroyalty (Book I, chap. 192). Thus Herodotus's 'Assyria' certainly includes the whole of Babylonia—Book III, chap. 155, is another example of this usage—and there is no evidence that it includes anything besides; for, in a passage describing the down-stream coracle traffic on the River Euphrates, his words 'the Armenians who live above (i.e. up-stream in relation to) the Assyrians' (Book I, chap. 194) can hardly be compelled to yield the meaning that his 'Assyria' was continuous with his Armenia and therefore included Mesopotamia as well as Babylonia. The *dahyāuš* officially styled 'Asshur' in Akkadian and 'Athura' in Old Persian did include Mesopotamia, as we shall see, but this official Assyria, unlike Herodotus's private 'Assyria', did not include Babylonia. It is the *dahyāuš* that Herodotus calls 'the Syroi' (Book III, chap. 91). Herodotus is aware that this, and not Babylonia, is the district that is called Assyria by 'the Barbarians' (i.e. the Orientals). 'The Barbarians', he writes in Book VII, chap. 63, 'used the name "Assyrioi" to mean the people whom the Hellenes called "Syrioi"—and these "Syrioi" are the people whom Herodotus includes in his Fifth Taxation District ('the whole of Phoenicia and the so-called Philistine Syria, together with Cyprus'), not the people of an 'Assyria' which contains Babylon and which is the ninth district in his list.

Why did Herodotus deliberately adopt this private and peculiar usage of the word 'Assyria' to mean Babylonia? His words in Book I, chap. 178, suggest that his intention was to convey the historical truth that, in his day, Babylonia was the sole extant representative of a civilization, common to a still surviving Babylonia and a now extinct Assyria, which Herodotus labels 'Assyriac' (e.g. in Book I, chap. 199), not 'Babylonic', because he is aware that Assyria, before her downfall and annihilation, had been the paramount Power in this society.

Babylonian Empire's administrative geography to designate that part of the defunct Assyrian Empire that had fallen to Babylon's share in the partition of—or scramble for—Assyria's spoils between Babylon, Media,¹ Egypt, and Cilicia; but the exact limits of this Neo-Babylonian dominion labelled 'Assyria' which the Achaemenian Empire had inherited are not easy to ascertain.

We may be sure that the Neo-Babylonian Empire's 'Assyria' did not include the border cantons of Babylonia on the east and north-east—e.g. Gambalu, Dêr, and Kar-Asshur—which Assyria had detached from Babylonia and annexed to herself in and after the reign of Tiglath-Pileser III (*regnabat* 746–727 B.C.).² These authentically Babylonian cantons must simply have been 'disannexed', and it is also possible that the Babylonians may have now taken their revenge by annexing to Babylonia cantons higher up the Tigris, in the direction of the City of Asshur, which were as authentically Assyrian as Kar-Asshur and Dêr were Babylonian. But how far up the Tigris had the Neo-Babylonian Empire's writ run? We know from Herodotus's itinerary of the Achaemenian Empire's Great North-West Road³ that neither the section of this highway east of the Tigris, running from Susa to the neighbourhood of Nineveh, nor the section west of the Tigris, running from the neighbourhood of Nineveh to the southern boundary of Armina, somewhere just north-west of Mardin, traversed either Bābiruš or Athurā (*alias* Asshur, *alias* Syria) at any point; and this means that the Median share of the Assyrian Empire must have included, in addition to the metropolitan territory of Assyria east of the Tigris, at least the portion of the Department of Nineveh that lay on the west bank, together with three departments—Tille, Nasibina (i.e. Nisibin), and Izalā—which, on the post-Alexandrine Hellenic map, were embraced in the province labelled with the imported Macedonian name 'Mygdonia'.

This, however, was not the south-western limit of the ex-Assyrian territory west of the Tigris that the Medes had occupied. Though, in 609 B.C., during the Allies' final campaign against the remnant of the Assyrian Army in the neighbourhood of Harrān, Nabopolassar had penetrated (if we are to accept his claim) as far as Izalā and even Urartu, not only these countries but Harrān itself had fallen into Median hands in the event; Harrān had remained in Median hands from *circa* 607–606 B.C. onwards; and it had not been acquired by the Neo-Babylonian Empire *de facto*, whatever the position may have been *de jure* during the intervening half century, till 555 B.C.⁴—that is to say, till Astyages of Media was already so gravely preoccupied with the insubordinateness of Cyrus II of Anšan that Nabonidus of Babylon could venture to eject the Median garrison from Harrān with impunity. Since in the Achaemenian Age the country round Harrān (i.e. the upper basin of the River Balikh) was certainly not included either in Armenia or in Cilicia or in the fragment of a partitioned Media which Herodotus labels 'Matiênê',

¹ See Herodotus, Book I, chap. 106.

² See Forrer, *op. cit.*, pp. 95–102, with the map of 'the development of Assyria, 745–606.'

³ Herodotus, Book V, chaps. 49–54.

⁴ According to Olmstead, *op. cit.*, pp. 36–37. According to Adontz, *op. cit.*, pp. 283–5 and 296–9, the date of Nabonidus's occupation of Harrān was 553 B.C.

this eleventh-hour acquisition of the Neo-Babylonian Empire's must have been left within the bounds of the Neo-Babylonian province of Asshur by Cyrus II when, after his conquest of the Neo-Babylonian Empire in 539 B.C., he kept it territorially intact as a single viceroyalty within his own universal state.

Wherever the northern boundary of the Achaemenian *dahyāuš* and Darian taxation district called Athurā-Asshur-Syria may have run, we know that—like the Syria of A.D. 1952—it comprised territory to the east as well as territory to the west of the River Euphrates; for the country through which, in 401 B.C., Xenophon and his comrades found themselves marching after they had crossed from the right to the left bank of the Euphrates was still Syria;¹ and, in Arrian's copy of both the field-state and the order of battle of Darius III Codomannus's army at Gaugamela in 331 B.C., the Syrians from Syria 'Between the Rivers' were brigaded with the Syrians from 'the Hollow Syria' under the single command of Mazaeus.² The portion of the province and taxation district labelled Syria-Asshur-Athurā which lay west of the Euphrates was called 'Hollow' by the Hellenes because it was traversed by the northernmost section of the Great Rift Valley which—after breaking southward out of the Taurus at Mar'ash and running up the Orontes Valley, through the Biqā', down the Jordan Valley, and through the Wādī 'Arabah, the Gulf of Suez, the Red Sea, and the Danākil Trough—continues up the Valley of the River Hawash in Abyssinia into Kenya Colony along a track punctuated, at this southern, as at the northern, end by lakes. The Babylonian name for the portion of Syria known on this account as 'Hollow Syria' in Greek was 'Beyond the River' (*Babyloniace* Ebir-nari, *Aramaicē* 'Abar-Nahara')³—i.e. beyond the River Euphrates, as distinguished from the portion of Syria 'Between the Rivers' Euphrates and Tigris. The capital of this Achaemenian *dahyāuš* 'Athurā', the province comprising the Neo-Babylonian Empire's eventual share of the Assyrian Empire's spoils, was situated in the portion 'Beyond the River', 15 parasangs (i.e. just over 89 kilometres) to the north-west of the crossing of the Euphrates at Thapsacus.⁴

For the capital of a province astride the western elbow of the Euphrates, this position was well chosen, since it was within easy reach of the more extensive but less populous and less wealthy eastern portion of the *dahyāuš* that lay 'Between the Rivers', while it stood just within the portion, lying 'Beyond the River', which contained the industrially, commercially, and navally important Phoenician city-states with their miniature *imperia in imperio*.⁵ Indeed, the 'Beyond the River' portion of Athurā-Asshur-Syria overshadowed the 'Between the Rivers' portion

¹ See Xenophon: *Expeditio Cyri*, Book I, chap. iv, § 19.

² See Arrian: *Expeditio Alexandri*, Book III, chap. viii, § 6, and chap. xi, § 4.

³ In a letter to the present writer, Professor G. G. Cameron points out that, in the Akkadian text of 'DSF', § 3g, ll. 30–35, 'Ebir-nari' is employed as the translation for 'Kāra hya Athuriya' ('the Assyrian people') of the Old Persian text. Since the passage states that 'the cedar timber, this—a mountain by name of Lebanon—from there was brought; the Assyrian people, it brought it to Babylon' (Professor R. G. Kent's translation in *Old Persian*, p. 144), it is certain that Syria between the west bank of the Euphrates and the eastern shore of the Mediterranean was comprised within the Achaemenian *dahyāuš* labelled 'Athurā'.

⁴ See Xenophon, op. cit., Book I, chap. iv, §§ 10–11.

⁵ See p. 582, above.

to such a degree that in popular, as distinct from official, usage the term 'Beyond the River' was employed as a name for the whole province. This popular usage is followed in private business documents drawn up in Babylonia in the reigns of Cyrus, Cambyses, and Darius I¹ and in the Book of Ezra, and eventually even in the Aramaic inscriptions on provincial coins struck *circa* 340 B.C. by the governor of Athurā, Mazaeus,² though we know from the field-state and the order of battle preserved by Arrian that 'Between the Rivers', as well as 'Beyond the River', was included in Mazaeus's province.

In all the Achaemenian official lists Athurā-Asshur is mentioned as a different *dahyāuš* from Bābiruš, but this does not mean that Athurā was from first to last a separate viceroyalty, any more than the mention of Suguda, side by side with Bākhtriš, means that Suguda was not under the Viceroy of Bākhtriš's administration. Athurā is, in fact, placed in immediate juxtaposition to Bābiruš in the three latest of the official lists ('DSe', 'DNa', 'XPh'), as well as in the earliest ('DB'); and this is an indication that Athurā and Bābiruš, like Suguda and Bākhtriš, still constituted a single viceroyalty down to the year in which 'XPh' was inscribed. The Babylonian private documents that mention Athurā under the popular name 'Ebir-nari' inform us in so many words that this *dahyāuš* was under the administration of the Viceroy of Babylon until at least the sixth year of Darius I's reign.³ On the other hand the governor of 'Abar-Nahara' (i.e. Athurā), Tatnai, and the Emperor Darius I corresponded with one another direct, and not via the Viceroy of Bābiruš, according to the Aramaic document embedded in the Book of Ezra (chapter v. 6—chapter vi. 12), whatever the value of this document may or may not be as historical evidence.⁴ Perhaps we may infer that Darius I left the original Viceroyalty of Babylon, which included Athurā as well as Babylonia, still intact on the political map, but dissected it, on his new fiscal map, into two separate taxation districts. Athurā had, however, certainly been separated from Bābiruš for political as well as for fiscal purposes by the time when Xenophon and his comrades traversed Athurā *en route* for Bābiruš in 401 B.C. Indeed, in that year the two provinces were not even conterminous; for, after crossing the River Khabor ('Araxes') just above its confluence with the Euphrates, Cyrus the Younger's expeditionary force, on the next stage of its advance down the left bank of the Euphrates, found itself marching through Arabia (*Persicè* Arabāya) for a distance of 125 parasangs (i.e. about 742½ kilometres) before entering Babylonia⁵ at a point not more

¹ See Leuze, O.: *Die Satrapieneinteilung in Syrien und im Zweistromlande von 520–320* (Halle (Saale) 1935, Niemeyer), pp. 25, 36–37, and 70.

² See Leuze, op. cit., p. 110.

³ See Leuze, op. cit., pp. 36–37 and 70. On the occurrence of the formula *Pahat Babilī u Ebir-nari* in Babylonian texts, Professor G. G. Cameron comments in a letter to the present writer: 'When a Babylonian says "Babylon and Ebir-nari", he can only mean that there was a single administrative unit comprising Babylon and Assyria [i.e. the *dahyāuš* known in Old Persian as Athurā] in official terms.'

⁴ 'It is difficult to regard this . . . as historical, or at any rate as belonging to the period in question. It looks as though it had originally referred to some other episode at some later time' (Oesterley, W. O. E.: *A History of Israel*, vol. ii (Oxford 1932, Clarendon Press), p. 85).

⁵ See Xenophon, op. cit., Book I, chap. v, §§ 1 and 5, and chap. vii, §§ 1 and 14–16.

than about $13\frac{1}{2}$ parasangs (i.e. just over 80 kilometres) to the north-west of 'the Median Wall'.

The *dahyāuš* called *Arabia* in Greek and *Arabāya* in Old Persian, which in 401 B.C. thus extended across the middle course of the Euphrates into the desert and steppe country of South-Eastern Mesopotamia according to Xenophon, also extended, according to Herodotus,¹ to the shore of the Mediterranean at the south-east corner of that sea, along a short stretch of coast between a point south-west of Gaza and a place called Iēnysos. Since the next stretch of the coast, extending from Iēnysos south-westwards, for the distance of a three days' journey, to the north-east corner of Egypt, was, according to Herodotus in the same context, part of Athurā (Syria), it looks as if a corridor of territory had been cut out of Athurā and granted to Arabāya by the Achaemenian Imperial Government expressly in order to give Arabāya an outlet on the Mediterranean; and we can read between Herodotus's lines² that this cession of territory had been a reward for services rendered by the Arabs to Cambyses in assisting his passage across the desert from Syria when he was invading Egypt.

In thus placing their Arab allies in charge of the desert sections of two such vital lines of Imperial communication as the route from Babylonia to Syria up the Euphrates and the route from Syria to Egypt along the Mediterranean coast, the Achaemenian Imperial Government were no doubt moved by the same considerations that had led them to place their Hauma-(?)drinking Sakan allies in charge of their borderland oyer against the Great Eurasian Steppe. They had realized that, in a steppe and desert country, the only effective police force that a sedentary Power could find to perform the task of keeping the local Nomad occupants in order was the local Nomad nation-in-arms itself, and that, if these high-spirited and self-confident Nomads were to be induced to police themselves on the Achaemenian Empire's behalf, they must be given the honourable status of free allies. The Achaemenidae were assuredly wise thus to adopt Nabonidus's fruitful policy of conciliating the Arabs instead of reverting to the Assyrians' sterile policy³ of trying to crush them on a *terrain* on which the Arabs were bound in the long run to have the advantage over the troops of any sedentary Power. The Arabs had to be brought to a halt by diplomacy if not by military operations, since they had been erupting out of Arabia into 'the Fertile Crescent' simultaneously with the Iranian Nomads' eruption out of Central into South-Western Asia in the eighth and seventh centuries B.C.⁴ Indeed, the Arabian frontier that Darius had inherited was perhaps little less formidable than the Central Asian one.

We have no information about the boundaries of the Achaemenian *dahyāuš* Arabāya at other points. We know that the temple-state of Jerusalem lay, not in Arabāya, but in Athurā, though Judah had never

⁴ See III, iii. 423.

been included in the Assyrian Empire, but had been annexed to the Assyrian province of the Neo-Babylonian Empire by Nebuchadnezzar. Presumably Nabonidus had intended to annex Edom likewise to Asshur when he had conquered Edom in 553 B.C.,¹ but here the Arabs were the *tertiū gaudentes*, for, when the remnant of Edom reappears on a post-Alexandrine Hellenic map, this 'Idumaea' lies as far north as the Negeb, in the former territory of the Hebrew tribe of Simeon, while the former territory of Edom in the Wādi 'Arabah, round Petra, has become the domain of 'the Agricultural Arabs' ('the Nabataeans'). We may guess that, in addition to Petra, the oasis of Taymā, in the North-Western Hijāz, which Nabonidus had reached and had liked so well that he had preferred it to Babylon as a residence, had subsequently become part of the Achaemenian Empire's Arabian sphere of influence.

It will be seen that the Achaemenian *dahyāuš* Arabāya embraced at least as much of the North-West Arabian and South-East Mesopotamian Steppe as the Arab phylarchy of the Banu Ghassān, which was in charge of the Roman Empire's Arabian marches on the eve of the Primitive Muslim Arab conquerors' eruption out of the interior of the Arabian Peninsula. The status of the Achaemenian *dahyāuš* Arabāya must also have been much the same as that of this Ghassanid phylarchy and its Lakhmid counterpart which performed the equivalent service for the Roman Empire's rival and the Achaemenian Empire's successor the Sasanian Empire.² In all three cases, Arab Nomad peoples whose pastures adjoined the borders of a sedentary Power were recognized by that Power as its autonomous allies in consideration of their undertaking the wardenship of the desert marches. We do not know, however, whether 'the King of the Arabs'³ with whom Cambyses negotiated for his expeditionary force a free passage overland from Syria to Egypt was the ruler merely of a local Arab principality that had supplanted the Edomites at Petra, or whether the same Arab prince's authority also extended south-eastward to Taymā in the Hijāz and perhaps north-eastward, as well, to Hatra in Mesopotamia.

Mudrāya was Egypt; the *Putāyā* appear to have been the Libyans⁴ to the west of Egypt as far as the hinterland of the cluster of Greek city-states on the bulge of Cyrenaica; *Kūša* was the Napatan Kingdom which occupied the south of the Egyptian World.⁵ Herodotus includes the two Hellenic communities *Kyrēnē* and *Barkē*, as well as *the Libyans adjoining Egypt*, in the same taxation district—his Number Six—as Egypt itself, and we may assume that, on the political map, they were likewise brigaded with Egypt in the same viceroyalty. On the other hand Herodotus reckons the Ethiopians who were Egypt's next-door neighbours as gift-bringing allies and not as tax-paying subjects,⁶ and the maintenance of a permanent garrison of professional troops at

Elephantinê by the Achaemenian Imperial Government¹ is evidence that its control over the Kingdom of Napata was only nominal.

The North-Western Quarter of the Achaemenian Empire—which was probably the quarter that was of least account in Persian eyes before the shocking disaster of 480–479 B.C.—begins with the *dahyāuš* named *Armina* (alias Arminiya; *Graecè* Armenia), which figures in Herodotus's description of his Taxation District No. 13 as one of its three constituent parts. We have already given reasons² for believing that, in the Darian division of a re-established Achaemenian Empire into taxation districts, the Armenian sub-empire was dissected into three districts: Armenia Proper; the strip of country between the northern boundary of Armenia Proper and the south shore of the Black Sea; and a western district consisting of Cappadocia-cum-Dascylitide. And we have suggested that Herodotus has inadvertently preserved the description of a Viceroyalty of Armenia in which all these three taxation districts were comprised thanks to his having mistaken this description of a political unit for a description of one of its three fiscal subdivisions. The taxation district in question was, on this view, confined in reality to Armenia Proper; and this was 'a small country'³ consisting of the Upper Tigris Basin together with the north-west corner of the Upper Euphrates Basin. The boundary between the taxation district consisting of this Armenia Proper and its western neighbour, the taxation district Cappadocia-cum-Dascylitide, will have run to the east of the road from the latter-day city of Sivas (*Graecè* Sebasteia) on the Upper Halys to the latter-day city of Malatīyah (*Graecè* Melitênê, *Assyriacè* Meliddu). The boundary between Armenia Proper and its northern neighbours the coastal peoples will have followed approximately the watershed between the Upper Euphrates Basin and the Black Sea.

What was the boundary between an Achaemenian Armenia and its eastern neighbour Urartu which, on the political map of the Achaemenian Empire, was included in the Viceroyalty of Media⁴ and which, on the Darian fiscal map, was associated, as is recorded in the Herodotean gazetteer,⁵ with the Hyspirītis and with a Matīênê or Matianê which embraced the Median share of Assyria as well as the basin of Lake Urmiyah? Under the Achaemenian régime at as early a date as 401 B.C. the western frontier of Urartu over against Armina already ran rather farther to the east than Urartu's Assyrian adversaries Tiglath-Pileser III and his successors had ever succeeded in pushing this frontier back; for when, in 401 B.C., Xenophon and his comrades, marching northwards, crossed the watershed between the Upper Tigris Basin and the basin of the Eastern Euphrates (Murād Su), and debouched into the valley of the Eastern Euphrates' left-bank affluent the Teleboas (the stream draining the plain of Mush), they found themselves passing out of Armenia, not into Urartu, but into another Armenia called 'the Armenia to the West'.⁶ This valley of the Teleboas and the

⁶ See Xenophon, *op. cit.*, Book IV, chap. iv, § 4.

section of the Eastern Euphrates Valley into which it opened¹ thus lay on the Armenian side of the boundary between Armenia and Urartu in the Achaemenian Age; but in the Assyrian Age they had lain inside the Urartian Kingdom's frontiers. The conquest of this piece of territory by King Menuas of Urartu (*regnabat circa* 828–785 B.C.)² is recorded in an inscription on a stele found near Mush in the village of Trmd.³ We may perhaps infer that during the bout of anarchy in South-West Asia at the turn of the seventh and sixth centuries B.C., between the collapse of the Assyrian and the establishment of the Median Power, Gurdi's Mushkian war-band which was then overrunning the former Assyrian territory of Naïri in the Tigris Basin overran the former Urartian territory in the Teleboas Valley as well, and that, when the Medes eventually imposed their rule on the autochthonous Urartians and on the intrusive Mushkians alike, they respected this accomplished fact in settling the boundary between an Urartu which they were incorporating into Media itself and an Armenia which they were making into a sub-empire within a Median Commonwealth.

If the valley of the Teleboas had in fact thus been transferred from Urartu to Armenia at some date between the end of the Assyrian and the beginning of the Median Age, this might prove to be the explanation of two puzzling pieces of nomenclature. In the first place it might explain how the Mushkian (i.e. Phrygian) followers of Gurdi,⁴ who, in their own language, called themselves Haik,⁵ came to be known in the Achaemenian official terminology neither as Haik nor as Mushki nor as Gordians, but as 'Arminiya'. This Old Persian ethnicon of a place-name 'Arminiya' may represent the Urartian word Urmeniuhi-ni which occurs in Menuas' inscription found in the neighbourhood of Mush as the name of one of the conquered local cities which he had rased to the ground; and, in confirming the cession of this Urartian canton called Urmeniuhi-ni to the Mushki intruders who called themselves Haik, the Medes, and the Persians after them, may have labelled these new owners of this transferred piece of Urartian territory with the Urartian local place-name. If this conjecture carried conviction, it might also explain why the *dahyāuš* that is labelled 'Arminiya' or 'Armina' in the Old Persian text of the Achaemenian official lists is labelled 'Ū-ra-aš-tu' (i.e. 'Urartu') in the Babylonian texts. Now that Urartu, save for the one district of Urmeniuhi-ni, had been swallowed up in the *dahyāuš* labelled 'Māda', the Babylonian archivists might have applied the label 'Urartu' to a *dahyāuš* which contained the only piece of ex-Urartian territory that had not lost its identity and that had been labelled with its historic Urartian local name in the Old Persian official nomenclature.⁶

¹ The two districts together constituted the Tarônitis of Strabo: *Geographica*, Book XI, chap. xiv, § 5 (C 528).

² According to Adontz, *op. cit.*, pp. 185 and 193.

³ See Adontz, *op. cit.*, pp. 153–4 and 221, and Prášek, J. V.: *Geschichte der Meder und Perser* (Gotha 1906, Perthes, 2 vols.), vol. i, p. 148.

⁴ See pp. 604–5, above.

⁵ Presumably taking this name from their jumping-off ground in a Hayasa, to the north-west of the north-western elbow of the Western Euphrates (*Turcičê Frat Su*, *alias* Qāra Su), which eventually acquired the name 'Lesser Armenia' (see p. 610, n. 2, above).

⁶ This tentative explanation of the origin of the name 'Arminiya' or 'Armina' is, of

'The Armenia to the West', which Xenophon and his comrades entered in entering the valley of the Teleboas, must in 401 B.C. have been a separate province of the Achaemenian Empire from the 'Armenia' which they had entered when they had left the country of the Kardoukhai behind them in crossing from the south to the north bank of the Centritês (Bohtân); for these two Armenias were under the administration of different viceroys: 'Armenia' under Orontes and Artuchas;¹ 'the Armenia to the West' under Tiribazus.² The portion of 'Armenia' through which they marched from the north bank of the Centritês to the headwaters of the Eastern Tigris was the province which the Assyrians had called Ulluba³ and which the post-Alexandrine Hellenic geographers were to call Arzanânê; and the village, containing a residence for the viceroy, through which they passed *en route*,⁴ will have been the seat of administration for Orontes' and Artuchas' viceroyalty. As for Tiribazus's viceroyalty 'the Armenia to the West', its name indicates that it must have included the westernmost parts of Armenia Proper, and this means that it must have extended westwards from the Tarônitis down the valley of the Eastern Euphrates (*Turcicê Murâd Su*) through Acilisênê⁵ into the extreme north-west corner of the Upper Euphrates Basin, beyond the right bank of the Western Euphrates (*Turcicê Frat Su*, *alias* Qâra Su), which the Hittites had called Hayasa and which, in the Roman Age of Hellenic history, eventually came to be labelled 'Armenia Minor' to indicate that it was the only piece of Armenian territory left outside the 'Armenia Major' which King Artaxias and his successors had united under the sovereignty of their house since 190 B.C.⁶ We may also presume that 'the Armenia to the West', which Tiribazus was administering in 401 B.C., included Sophênê, the

course, highly speculative. One alternative possible derivation for 'Armina' is 'Erimena', the name of the father of the last known king of Urartu, Rusas III (*regnabat* 610-585 B.C. according to Adontz, *op. cit.*, p. 193). Another possible derivation is 'Arumu-ni', meaning the country of the Arameans who had flooded out of the North Arabian Steppe into Nairi at the turn of the second and the last millennium B.C. (see p. 604, above) and whose name had eventually come to the ears of Hellenic explorers of the southern shore of the Black Sea as the 'Armoi' of the *Iliad*, Book II, line 783. This last of our three alternative etymologies for the name 'Armina' is commended by the Upper Tigris Basin's latter-day name 'Diyâr Bakr', which signifies in Arabic the lands occupied by an Arab Nomad tribe called the Bakr which had pushed its way in from Mesopotamia some time before the Muslim Arab conquest of the Upper Tigris Basin (see Le Strange, G.: *The Lands of the Eastern Caliphate* (Cambridge 1905, University Press), p. 86. On this analogy it might be conjectured that the Upper Tigris Basin had derived its Old Persian name 'Armina', representing an Urartian 'Arumu-ni', from a previous wave of Semitic-speaking Nomad immigrants from the South.

¹ See Xenophon, *op. cit.*, Book IV, chap. iii, §§ 3-4.

² See *ibid.*, chap. iv, § 4.

³ See Xenophon, *op. cit.*, Book IV, chap. iv, § 2.

⁴ See Forrer, *op. cit.*, pp. 85-87.

⁵ Strabo makes Acilisênê march with Sophênê along the Antitaurus (i.e. along the watershed between the Upper Tigris Basin and the Upper Euphrates Basin) and also lie between the Taurus and the Euphrates valley bottom ('potamia') above the point where this bends southward (*Geographica*, Book XI, chap. xiv, § 2 (C 527)). The two indications in this passage can be reconciled if 'the Taurus' here means the Dersim Mountains in the quadrilateral between the two arms of the Euphrates, and if 'the Euphrates' here means the Eastern Euphrates (*Turcicê Murâd Su*). Acilisênê would then be approximately coextensive with the latter-day Turkish vilayet of Kharput. Another passage (*Geographica*, Book XII, chap. iii, § 28 (C 555)), in which Strabo says that Acilisênê is demarcated by the Euphrates from Armenia Minor, would be reconcilable with the previous passage if, in this second passage, 'the Euphrates' means the Western Euphrates (*Turcicê Frat Su*, *alias* Qâra Su).

⁶ See pp. 626-7, above, and 664-6, below.

Armenian canton in the Upper Tigris Basin¹ which lay immediately to the west of Arzanênê.

If these were approximately the bounds of 'the Armenia to the West' which was one of the political divisions of the Achaemenian Empire in 401 B.C., Tiribazus's viceroyalty was perhaps the matrix of an Armenian successor-state of the Achaemenian Empire, with its capital at Arsamosata in the lower valley of the Eastern Euphrates, in the neighbourhood of Kharpût, whose King Xerxes² was brought to heel by the Seleucid King Antiochus III *circa* 212 B.C.³ Since Xerxes was subsequently liquidated by his Seleucid conqueror,⁴ it looks as if Xerxes' *ci-devant* kingdom, and Tiribazus's *ci-devant* viceroyalty, survived in an Armenian province of the Seleucid Monarchy—consisting of Acilisênê, Sophênê, Odomantis,⁵ 'and other territories'—whose military governor, Zariadris,⁶ declared his independence after his former Seleucid master Antiochus III's catastrophic defeat by the Romans in 190 B.C.⁷

Zariadris' Armenian successor-state of the Seleucid Empire did not include 'Armenia Minor', to the north-west of the north-western elbow of the Western Euphrates, since we know⁸ that, soon after the year 183 B.C., Armenia Minor was under the rule of a 'satrap' of its own, named Mithradates, whose acts show that, notwithstanding his title, he was an independent prince *de facto*. We do not know whether this *de facto* independence had been acquired by Armenia Minor at the time of the fall of the Achaemenian Empire or at the time of the liquidation of Xerxes of Arsamosata or at the time of Zariadris of Sophênê's secession from the Seleucid Empire in 190 B.C. We do know, however, that Zariadris had a brother military governor of a sister Armenian province of the Seleucid Empire who seceded simultaneously, and that the Armenian province which this colleague of Zariadris' named Artaxias was administering at the time lay on the middle course of the River Aras, in the district where, at some date between 190 and 183 B.C.,⁹ he laid out a new capital which he called Artaxata after his own name.

¹ Strabo, in his *Geographica*, Book XI, chap. xiv, § 2 (C 527), states that Sophênê lay between Mount Masius (i.e. the watershed between the Upper Tigris Basin and the Khabûr Basin) and the Antitaurus (i.e. the watershed between the Upper Tigris Basin and the Upper Euphrates Basin).

² The name of this King Xerxes of Arsamosata was perhaps commemorated in the name of the province called Xerxênê or Deroxênê (the latter-day Dersim) astride the Western Euphrates above Acilisênê and Armenia Minor and below the Caranitis.

³ See Polybius, Book VIII, chap. 23 (25), as interpreted by Edwyn Bevan in *The House of Seleucus* (London 1902, Edward Arnold, 2 vols.), vol. ii, pp. 15–16.

⁴ See Bevan, *ibid.*

⁵ Odomantis is likely, to judge by its Macedonian name, to have lain on the Mesopotamian side of Mount Masius, between an Anthemusias and a Mygdonia which had likewise been named after cantons of the Seleucids' Macedonian homeland.

⁶ The name "Zariadris" obviously contains as its first element Avestan "za'ri-", Sanskrit "hari-", meaning "yellow, gold-coloured, yellow-green". In trying to identify its second element, the -dr- in "Zariadris" makes me think of Avestan "vazra-", Sanskrit "vajra-" (the first element in Old Persian "vazraka", meaning "great"), with Median z = Old Persian d from Indo-European ĝ(h), meaning the club of Indra in Sanskrit, which was the thunderbolt or lightning. So "Zariadris" = "za'ri-vadri-š" or "za'ri-vazri-š", meaning "having (or wielding) the yellow club (the lightning)".—Note by Professor R. G. Kent.

⁷ See Strabo, Book XI, chap. xiv, § 5 (C 528) and § 15 (C 531–2).

⁸ See Bevan, *op. cit.*, vol. ii, p. 123.

⁹ This must be the *terminus ante quem*, if Strabo (*Geographica*, Book XI, chap. xiv, § 6 (C 528)) is correct in reporting that Artaxias employed Hannibal's services in this piece of town-planning.

If, in Achaemenian parlance, the name 'Armina' or 'Arminiya' had signified, as we have argued that it did, not the former Chaldian Kingdom of Urartu, but its western neighbours Hayasa (*Latinè* Armenia Minor) and Naïri (*Latinè* Acilisênê, Sophênê, and Arzanênê), which, at the moment of the collapse of the Assyrian Empire, had been overrun by Gurdi's war-band of Phrygian-speaking Mushki barbarians, the Haik, it is surprising to find the name Armenia adhering, in 190 B.C., to a district on the course of the Middle Aras which not only lay, as the Teleboas Valley likewise lay, within the former frontiers of the Kingdom of Urartu, but was actually situated in the extreme north-eastern corner of the Kingdom of Urartu's former domain, at the farthest possible remove from the region, adjoining the western and south-western frontiers of Urartu, which had been overrun by Gurdi's war-band at the turn of the seventh and sixth centuries B.C. At what date, and in what circumstances, had the name 'Armenia' come, by the year 190 B.C., to extend as far afield as the middle course of the Aras Valley, where at that date Artaxias was administering an Armenian province on the Seleucid Monarchy's behalf, and where, after declaring his independence, he founded the city of Artaxata?

Recollecting that, in the Achaemenian official lists, the Old Persian name 'Armina' is rendered as 'Urartu' in the Babylonian versions of the texts, we might be inclined, on first thoughts, to jump to the conclusion that, when Gurdi's war-band had crossed the north-western elbow of the Western Euphrates (Frat Su, *alias* Qāra Su) towards the close of the seventh century B.C., they had overrun, not only the Assyrian dominions in Naïri and the Teleboas Valley, but the whole of the adjoining Kingdom of Urartu as well, and that, in consequence, Urartu had been brigaded by Median and Persian empire-builders with Naïri and Hayasa to constitute the Achaemenian *dahyāuš* called 'Armina' within a sub-empire that also included both Cappadocia and the strip of country between Armina and the Black Sea, instead of being brigaded with the Urmīyah Basin (Matianê) and Adiabênê to constitute Herodotus's Taxation District No. 18 within a Greater Media. Might not this association be just another of Herodotus's blunders? And would not the identification of Xenophon's 'Armenia' with Urartu, and of Xenophon's 'Armenia to the West' with Naïri plus Hayasa, make sense of Xenophon's data as well as Strabo's? This explanation of the adhesion of the name 'Armina' to the middle course of the River Aras in 190 B.C. would be an attractively simple one, but, on further consideration, we shall see that, after all, it will not fit the facts.

In the first place, Xenophon's 'Armenia', which lay in the Upper Tigris Basin between the north bank of the River Centritês (Bohtān) and the Tigris-Euphrates watershed, can hardly have formed part of the same Achaemenian viceroyalty as Urartu if the Teleboas Valley belonged to a different viceroyalty called 'the Armenia to the West', since the head of the Teleboas Valley is traversed by the only practicable route between the Upper Tigris Basin and the Basin of Lake Van, which had been the former Kingdom of Urartu's nucleus and heart, so that an 'Armenia to the West' that comprised the Teleboas Valley

would virtually have insulated 'Armenia' and Urartu from one another. In the second place the passage (whatever its provenance may be) in which Strabo informs us that, in 190 B.C., the middle valley of the River Aras was already Armenian territory, contains further information which indicates that this was the only part of the former domain of the Kingdom of Urartu that, at this date, was, as yet, Armenian. Strabo not only states explicitly¹ that Armenia had been 'a small country' down to the time of Zariadris' and Artaxias' simultaneous declarations of independence in 190 B.C.; he goes on, in this passage and in a subsequent one,² to give a catalogue of the successive territorial acquisitions by which Artaxias and his successors progressively built up a Kingdom of Armenia Major which, in Strabo's own day, extended from the east bank of the Western Euphrates to the western shore of the Caspian Sea round the debouchure of the rivers Aras and Kur, and from the watershed between the Khabûr and the Tigris along Mount Masius to the south bank of the River Kur and to the farther side of its head-waters.

This progressive aggrandisement of Artaxias' Armenian kingdom was crowned by his descendant Tigranes' annexation of the sister Armenian kingdom of the House of Zariadris;³ but this eventual preponderance of the Artaxiads over the Zariadrids was the cumulative result of a previous progressive expansion of the Artaxiad dominions in other quarters at the expense of divers non-Armenian peoples and states; and, in this context, Strabo gives us three pieces of information which throw light on our present problem. In the first place the Armenian language—i.e. the historic Armenian language, of Indo-European origin, which had been carried from Hayasa to the east side of the Euphrates by Gurdi's Phrygian-speaking Mushki followers whose own name for themselves was 'Haik'—had become the common language of the heterogeneous population of Armenia Major only as a consequence of the political unification of all these peoples under the Artaxiad Crown. In the second place, one of the countries at whose expense the Artaxiads had enlarged their dominions had been Media. In the third place the Median territories which the Artaxiads had annexed to their expanding Kingdom of Armenia Major had been Kaspianê, Phaunitis, and Basoropeda.⁴

Of these three territories which, according to Strabo, had previously belonged to Media, one, namely Basoropeda (*Armeniaccè* Vaspuragan), lay on the east side of the Van Basin in the heart of Urartu and therefore within the limits of the canton which Herodotus calls 'Alarodioi' and which he associates, not with Armenia, but with the Saspeires and the Matiênoi who, together with these Alarodioi, constitute, as we have seen,⁵ his Taxation District No. 18. Another of the three ex-Median districts annexed by the Artaxiads, namely Kaspianê, lay in the Lower Aras-Kur Basin and is assigned by Herodotus, as we have likewise seen,⁶ to his Taxation District No. 15, labelled 'Sakai and Kaspioi'. We must infer that in 190 B.C. both the Lower Aras-Kur Basin and the

⁵ On pp. 628-32, above.

⁶ On pp. 626-8, above.

Van Basin were still Median, and not yet Armenian, in the political sense, and *a fortiori* that they were then still non-Armenian-speaking countries, considering that, according to Strabo, the Armenian language made its way there only in the wake of the Artaxiad House's conquests.

The Media to which these two districts thus still belonged in 190 B.C. will have been the Media Atropatênê (the latter-day Azerbaijan) that was one of the Iranian successor-states of the Achaemenian Empire; and we may infer that, in the scramble for possession of the former Achaemenian dominions after the overthrow of the last Darius by Alexander, the territories on which Atropates, the founder of the successor-state that came to be called after him, had succeeded in laying hands had been the Herodotean Taxation District No. 18, save for Adiabênê, together with the Herodotean Taxation District No. 15. Media Atropatênê will have continued to hold the portions of these ex-Achaemenian territories comprised in Kaspianê, Basoropeda (Vas-puragan), and the Phaunîtis until it lost them to a rising Artaxiad Power at some date subsequent to the year 190 B.C. But, like the Basin of Lake Van, which still belonged to Media Atropatênê at that date, the middle valley of the River Aras, which was the nucleus of the Artaxiad Kingdom and which was already Armenian in 190 B.C., had been part of the former Kingdom of Urartu and must therefore likewise have been included in the Herodotean Taxation District No. 18 originally. At what date, then, had this section of the Aras Valley become Armenian instead of Median?

In the absence of any other information on this point, we can only say that there is no evidence to indicate that the transfer had taken place until after the fall of the Achaemenian Empire, while there is one piece of evidence which suggests that the district in the middle valley of the Aras, of which Artaxias was military governor, on behalf of the Seleucid King Antiochus III, in 190 B.C., may have been taken from Media Atropatênê and annexed to Armenia by Antiochus III himself after his liquidation of the Armenian King Xerxes of Arsamosata at some date after his subjugation of Xerxes in 212 B.C. The conqueror, whoever he may have been, who annexed the middle valley of the Aras to Armenia must have arrived there by forcing his way into the Aras Basin up the valley of the Western Euphrates and over the Frat Su (Qāra Su)-Aras watershed; and, if there is any substance in our conjecture¹ that the name of the province called Derxênê (Xerxênê), astride the Western Euphrates immediately above Acilisênê, commemorates Xerxes of Arsamosata's conquest and annexation of this district, we may further infer that Derxênê also marks the limit of Xerxes' conquests in this direction. If so, the middle course of the Aras must have been annexed to Armenia by some successor of Xerxes; and his only successor, down to the year 190 B.C., had been Antiochus III.

On this showing, we may abide by our previous finding that, in the Achaemenian Age, no portion of the former Kingdom of Urartu except the Teleboas Valley (the Tarônîtis) was included in the *dahyāuš* whose Old Persian name was 'Armina', notwithstanding the fact that the

¹ On p. 663, n. 2, above.

official Babylonian rendering of 'Armina' is 'Urartu'; and we may confirm our identification of the Achaemenian 'Armina' with a territory confined to the Upper Tigris Basin and the north-west corner of the Upper Euphrates Basin, corresponding to the Assyrian 'Naïri' together with the Hittite 'Hayasa'.¹

The peoples lying between Armenia Proper and the Black Sea whose country was embraced, on the political map, in the Viceroyalty of Armenia, while it constituted, on the fiscal map, the Herodotean Taxation District No. 19, were, as enumerated by Herodotus in his gazetteer and rearranged in their apparent geographical sequence from east to west, the refugee *Mâres* who had inherited their name from the Hurrian or perhaps Eurasian Nomad 'mariannu'² and were to bequeath it to the latter-day Georgian canton Imerethia in the upper basin of the River Rhion (Phasis); the refugee *Moskhoi* who were to bequeath their name to the latter-day Georgian canton Meskhethi round the headwaters of the River Kur; the *Makrônes* on the northward descent from the watershed on which, in 400 B.C., Xenophon and his comrades were to catch their first glimpse of the Black Sea;³ the *Mossynoikoi* along the seaboard to the west of Trebizond;⁴ and the *Tibarênoi* along the seaboard to the west of the Mossynoikoi.⁵

The Herodotean Taxation District No. 19, which these peoples occupied between them, must have been bounded on the west, like Armina, by the Viceroyalty of Katpatuka, and on the east by 'the Kolkhoi and adjoining peoples as far as the Caucasus Range' who, according to Herodotus,⁶ were 'gift-bringers' and not tax-payers. In 400 B.C. there were Colchians astride the road leading from the country of the Makrônes to Trebizond;⁷ and, if, in the Achaemenian Age, the Colchians occupied the seaboard without a break from this point eastwards to the Caucasus, they must have insulated the Mâres and Moskhoi from the Makrônes, Mossynoikoi, and Tibarênoi—unless the Mâres and Moskhoi were at this time located somewhere farther to the west than the Georgian cantons that were eventually to be called after them.⁸ However that may

¹ In this connexion it is noteworthy that, in the field-state of Xerxes expeditionary force (Herodotus, Book VII, chap. 73), the Armenians are associated, not with the Urartians ('Alarodioi'), but with the Phrygians and other peoples of Central Anatolia. They are equipped like, and are brigaded with, the Phrygians (of whom they are stated, in this passage, to be an offshoot); and the Armeno-Phrygian equipment is described as being a sub-variety of the Paphlagonian. We may guess that the culture represented by this equipment was really Hittite rather than Paphlagonian in origin.

⁶ In Book III, chap. 97.

⁷ See Xenophon, op. cit., Book IV, chap. viii, §§ 8-9.

⁸ In Anatolia, as in Iran, the brigading of the national contingents, as described in the field-state of Xerxes' expeditionary force, partly cuts across their grouping for civil administrative purposes, as described in the gazetteer of Darius's taxation districts. The two peoples at the two extremities of District No. 19—the Moskhoi and the Tibarênoi—are brigaded under one command; the Makrônes and Mossynoikoi under another; and the Mâres with the Colchians, who were a non-tax-paying people not included within the bounds of the Nineteenth District. To judge by Herodotus's description of their equipment, the Colchians, as well as all the peoples of the Nineteenth District, belonged to the same cultural group as the Saspeires and the Alarodioi. The Tibarênoi, Makrônes, and Mossynoikoi are paraded in Moschian equipment, the Kolkhoi, Alarodioi, and

be, Herodotus's 'Kolkhoi and adjoining peoples as far as the Caucasus Range' seem more likely than the peoples in his Taxation District No. 19 to represent the *Ākaufačiyā* ('the People of the Mountains') whose name appears in 'XPh' alone among the official lists.

The Kingdom called *Cilicia* in Greek and *Khilakku* in Assyrian is left unmentioned in the official lists of *dahyāva* in deference to its juridical status of sovereign independence, though its *de facto* relation to the Achaemenian Empire may be more accurately conveyed by Herodotus in his erroneous inclusion of it among Darius's original twenty taxation districts as his District No. 4.¹

At the turn of the eighth and seventh centuries B.C. Khilakku had been merely one of nine or ten petty principalities in South-Eastern Anatolia, between the Upper Euphrates and the Upper Halys, over which the Assyrians had asserted a suzerainty that had been short-lived and at no time very firmly established; but, in the subsequent scramble at the turn of the seventh and sixth centuries B.C. for Assyria's derelict dominions, Khilakku had distinguished herself from her neighbours by her Autolycean deftness as 'a snapper-up of unconsidered trifles'² and by the tact—almost equal to the Vicar of Bray's—with which she had succeeded in keeping on good terms with surrounding Great Powers who were on bad terms with one another. The measure of her achievement was that, after having enlarged her original patrimony four- or five-fold, she had succeeded, without having to forfeit any of her territorial gains, in securing a place for herself within the framework of the Achaemenian universal state on the juridical footing of a sovereign independent ally of the Imperial Power.

Three indications of the *tracée* of the Kingdom of Cilicia's expanded frontiers within the Achaemenian imperial framework are to be found in Herodotus's history. This Achaemenian Cilicia marched with the Viceroyalty of Armenia along a navigable section of the River Euphrates where the Great North-West Road crossed the river out of Armenia into Cilicia.³ On the Mediterranean shore—and the once land-locked statelet of Cilicia now had a long and valuable coastline on the Mediterranean—the boundary between Cilicia and the Viceroyalty of Syria was Cape Posidëium (*Arabichè Ras-al-Basit*), that is to say, a point on the coast to the south of the mouth of the River Orontes.⁴ On the Anatolian Plateau, in the region containing the city of Mazaka—where, on a post-Alexandrine Hellenic map, the name 'Cilicia' still attached to one of the provinces of a latter-day Kingdom of Inland Cappadocia—the Kingdom of Cilicia in the Achaemenian Age bestrode the River Halys from a point below the river's exit from the Armenian highlands where it had its source to a point beyond its southward bend where Cilicia gave way on the right bank to the country of the Western Matiënoi and on the left bank to Phrygia.⁵

Saspeires in sub-Moschian equipment. We may guess that the culture represented by this equipment was really Urartian rather than Mushkian in its origin.

⁴ Book III, chap. 91.

⁵ Book I, chap. 72.

In terms of the political geography of the Assyrian Age, these indications tell us that, to the south, Khilakku had annexed at least six once independent principalities: Tukhāna (*Graecè* Tyana) and Atuna or Tuna (*Graecè* Tynna) between the original Khilakku and the Taurus Range; Tabal (Bit Burutash) in the Antitaurus; Qu'e¹ (*Graecè* Akhaioi);² Sam'al³ in the North Amanus; and Unqi, astride the lower reaches of the River Orontes, where first Antigonos Monophthalmus and then Seleucus Nicâtôr was to choose the site for the capital city of a South-West Asian empire.⁴ To the east, Khilakku must have annexed at least two principalities, for, as we have seen,⁵ the Cilician territory on the west bank of the Euphrates into which the Great North-West Road ran after crossing the river out of Armenia must have been the region round Malatīyah (*Graecè* Melitênê, *Assyriacè* Meliddu), and Khilakku could not have annexed Meliddu without having also annexed at least the intervening south-western part of the principality of Kammanu.⁶

We may also guess that Khilakku had acquired Kummukhu (*Graecè* Commagênê) along the Euphrates immediately to the south of Meliddu and immediately to the north of the river's western elbow, and Gurgum (whose capital Marqasi was to bequeath its name to Mar'ash) between Kummukhu and Sam'al. On the other hand the Babylonians must have managed to lay hands on Carchemish, Arpaddu, and Til Turi between the elbow of the Euphrates and the eastern frontiers of Sam'al and Unqi; for they undoubtedly had access overland, through territory of their own, from the elbow of the Euphrates to their dominions in Ebir-nari. Again, Herodotus's itinerary of the Great North-West Road informs us that Til-Garimmu—a province of Kammanu in the upper basin of the Tokhma Su right-bank tributary of the Euphrates, immediately adjoining Meliddu to the north-west—must also have lain outside the bounds of the Kingdom of Cilicia and must have been included within the Achaemenian *dahyāuš* Katpatuka.

We can be sure of this because Herodotus tells us⁷ that, from the point where the Great North-West Road entered Cilicia after crossing the Euphrates out of Armenia, this road ran through Cilician territory for the distance of only 15½ parasangs (just over 89 kilometres); and, on the assumption that the point of entry into Cilicia was the river-crossing on the road from Kharpūt to Malatīyah, Herodotus's figure yields us

¹ Qu'e, with its well-placed ports and with the largest area of prime agricultural land to be found anywhere in Anatolia west of Lydia and the Dascylitis, was Khilakku's greatest prize.

² Hyp-Akhaioi according to Herodotus, Book VII, chap. 91.

³ The name survived as late as A.H. 163, in the reign (A.D. 775–85) of the 'Abbasid Caliph Mahdī (see Ahmad al-Balādhuri: *Kitāb Futūh al-Buldān*, vol. i, translated by P. K. Hitti (New York 1916, Columbia University Press), pp. 263–4).

⁴ See p. 201, above.

⁵ On p. 629, n. 4, *ad finem*, above.

⁶ While this principality of Kammanu that was Khilakku's eastern neighbour perhaps derived its name from the city of Comana, the latter-day province of the Kingdom of Inland Cappadocia called Chammanênê, in the bend of the Halys where Herodotus locates the Western Matienoi, was possibly called after Prince Kamanā or Kamamas (? *Hebraicè* Haman, *Graecè* Haimôn) of Carchemish, whose father King Aias campaigned in South-East Anatolia in the first half of the eighth century B.C. (see Cavaignac, E.: *Le Problème Hittite* (Paris 1936, Leroux), p. 165; Delaporte, L.: *Les Hittites* (Paris 1936, La Renaissance du Livre), pp. 335–6).

⁷ In Book V, chap. 52.

two pieces of information: from the Euphrates crossing the road must have run north-westwards over the Uzun Yaila to Sivas in the upper valley of the Qyzyl İrmâq (Halys), and it must have run out of Cilicia into Cappadocia only a short distance to the north-west of Malatīyah town, that is to say, at the boundary between the former principality of Meliddu and Til-Garimmu.¹ Herodotus's figure of 15½ parasangs allows of no other location for this sector of the frontier between Cilicia and Cappadocia, and *a fortiori* it allows of no other alinement for the Great North-West Road in this stretch; for either of the two alternative routes running westward from Malatīyah via Mazaca (the latter-day Qaysari), in contrast to either of those running north-westward from Malatīyah via Sivas, would carry the road through what must indubitably have been Cilician territory for many times the distance—only 15½ parasangs—that Herodotus gives for this Cilician section. An alinement via Sivas also has two other points in its favour: it would allow for the at first sight surprisingly long distance of 104 parasangs which Herodotus gives for the Cappadocian section of the road from the Cilician-Cappadocian frontier to the crossing of the Halys out of Cappadocia (in the narrower sense) into Phrygia; and it would allow for an alinement through Hattusas (Boghazqal'eh), the site of the former capital of the Hittite Empire, which must once have been the centre from which all roads in Eastern Anatolia radiated.

What were the affinities of the people, called Khilakku in Assyrian and Kilikes in Greek, who had built this miniature empire *circa* 600 B.C.? When the principality of Khilakku makes its first appearance in history at the turn of the eighth and seventh centuries B.C. it has Mita's Mushki

¹ Herodotus tells us that, where the road crossed the Cilico-Cappadocian frontier, it ran through a pair of gates and passed by a pair of guard-houses. This description in the Herodotean itinerary of the Great North-West Road is to be interpreted in the light of an eyewitness's account of the security arrangements on the Cilico-Syrian frontier in 401 B.C. At this point in their anabasis, Xenophon and his comrades passed through a pair of gates in a pair of walls extending from the Mediterranean shoreline to the cliffs overhanging it. The north wall was manned by a Cilician garrison, the south wall (in normal times) by an imperial garrison, and there was a no-man's-land, three hundred yards wide, in between (Xenophon, *op. cit.*, Book I, chap. iv, §§ 4-5). Evidently this was the layout at road-crossings between autonomous and imperial territory where there was no frontier river to provide a natural insulator such as the Euphrates provided between Cilicia and Armenia, and the Lower Khabûr between Arabāya and Syria. There were gates, for example, between Arabāya and Bābiruṣ (see *ibid.*, chap. v, § 5); and Xenophon's mention of a pair of guard-houses, as well as a pair of gates, on the frontier between Cilicia and Syria suggests that, on the Great North-West Road, the pair of gates mentioned by Herodotus may have been located at the point, a few miles to the north-west of Melitēnē on the more easterly of the two Melitēnē-Sebasteia roads, which is labelled 'praetorium' in the Roman itineraries (see J. G. C. Anderson's map *Asia Minor* (London 1903, John Murray)).

It may be noted, in passing, that Xenophon's account of his itinerary shows that the territory of the 'sovereign independent' Kingdom of Cilicia had been drastically reduced, since the date of Herodotus's official sources, by the Imperial Power which was in theory Cilicia's ally. In 401 B.C. Dana (i.e. Tyana) was already part of an Imperial Viceroyalty of Cappadocia (Xenophon, *op. cit.*, Book I, chap. ii, § 20); and this means that the Imperial Government must have detached from Cilicia by this time not only Tyana but the Cilicia astride the River Halys which had been the historical nucleus of the Cilician Kingdom. Moreover, the pair of gates and guard-houses which in 401 B.C. marked the frontier between Cilicia and an Imperial Viceroyalty of Syria stood between the shore of the Mediterranean and the cliffs of the Amanus on the east coast of the Gulf of Alexandretta (*ibid.*, chap. iv, §§ 1-5); and this means that by this time the former principality of Unqi had been transferred from Cilicia to Syria. Thus by 401 B.C. Cilicia had already been reduced to its latter-day limits between the Taurus and the Amanus.

for its neighbours on the south-west in Lycaonia and the ubiquitous Gurdi's Mushki for its neighbours first on the south, in Tyana, in the reign of Tiglath-Pileser III of Assyria (*regnabat* 746-727 B.C.),¹ and then on the north-east in Til-Garimmu, astride the road running south-east via Na'iri to Assyria, in 695 B.C.² Our line of least resistance would be to guess that the Khilakku were Phrygians like their neighbours; and this guess would not conflict with the Hellenic evidence; for, in the earliest appearance of the Kilikes in Hellenic literature, they are located in the south-west corner of Hellespontine Phrygia, at the head of the Gulf of Edremid (Adramyttium), in Thêbê under Mount Plakos. Hector's wife Andromachê was one of them, and her father had been king of this north-western Cilicia till Achilles had killed him and sacked Thêbê.³ It looks as if the Kilikes had been the advance-guard of the Phrygian barbarians who had broken out of South-East Europe into the Hittite World at the turn of the thirteenth and twelfth centuries B.C. The Kilikes who had settled at Thêbê would be a detachment that had wheeled to the right after their passage from the European to the Asiatic shore of the Dardanelles; the Khilakku of Mazaka would be a detachment that had wheeled to the left, marched eastwards along the plain between Dascylium and the Mysian Olympus, and climbed on to the Anatolian Plateau at In Önü, like their Hittite predecessors and like their Galatian successors some fifteen hundred years later.

Herodotus's Taxation District No. 3, which included the *dahyāuš* called *Katpatuka* (Cappadocia), had two peculiarities. The first of these was its size. From the upper basin of the Tokhma Su tributary of the Euphrates and from the upper reaches of the Halys it extended right across Anatolia to the Asiatic shore of the Dardanelles, and it was broad as well as long, for there is no indication that it embraced less than the whole of Inland Phrygia, and that country extended south-westwards into the upper basin of the River Maeander. The second peculiarity of this taxation district was that it straddled a former international frontier—uniting, as it did, ex-Median territory to the east of the Middle and Lower Halys with ex-Lyidian territory to the west of it.

This feature of Herodotus's District No. 3 was peculiar without being unique, considering that his District No. 14 similarly united Harahvatiš with the three south-eastern cantons of Pārsa; and, even if there had not been this parallel case, there could not have been any doubt about the facts. The administrative union of ex-Lyidian territory to the west of the Halys with the ex-Median *dahyāuš* Katpatuka was attested by the consensus of several different pieces of evidence, positive as well as negative. In the first place it was on record that a territory administered from Dascylium, on or near the south shore of the Sea of Marmara, had been detached from Lydia since Cyrus II's day.⁴ In the second place this ex-Lyidian territory did not appear under any separate and distinctive

¹ See König, *op. cit.*, p. 15.

² See Forrer, *op. cit.*, p. 80.

³ *Iliad*, Book VI, ll. 395-7 and 414-28.

⁴ We know from Herodotus, Book III, chaps. 120, 126, and 127, that Orætes, who had been appointed Viceroy of Sardis (Sparda) by Cyrus II, had a colleague and rival named Mitribates who was governor of 'the province of Dascylium', i.e. the northern and north-eastern parts of the former Lyidian Empire (see p. 611, n. 1, above).

name of its own in any of the official lists of *dahyāva*;¹ and, among all the *dahyāva* named in any of the lists, there is no *dahyāuš* except Katpatuka to which this ex-Lyidian territory could have been attached—as it must have been attached to one or other recognized *dahyāuš* if it was not recognized as a separate one in its own right. The only *dahyāva* on the mainland of Anatolia that are named in any of the lists are Sparda (Sardis), which was the viceroyalty from which the Dascylitis had been detached; 'the Ionians on the mainland', who were insulated from Dascylium by the Viceroyalty of Sardis; Karkā (Caria), which was insulated from Dascylium *a fortiori*; and Katpatuka. The process of exhaustion seems to force upon us the conclusion that, at the dates at which all our six official lists were drawn up, the ex-Lyidian territory whose seat of administration was at Dascylium was attached to the ex-Median *dahyāuš* Katpatuka.

This conclusion, which is thus presented to the investigator by the negative evidence of the official lists taken in conjunction with Herodotus' mention of a separate governorship of Dascylium in the days of Orætes' administration at Sardis, is positively corroborated by Herodotus' description of the third taxation district in his gazetteer; for he describes this district as including, in addition to the Cappadocians (*alias* Syrioi), who lived to the east of the River Halys, five peoples who lived to the west of the Halys: namely the *Paphlagones* immediately to the west of the Lower Halys; the *Mariandynoi* to the west of the Paphlagones, in the hinterland of the Hellenic city Heraclea Pontica; the *Asiatic Thracians*, between the debouchure of the River Sangarius into the Black Sea and the Asiatic shore of the Bosphorus; the *Phrygians*, whose domain extended from the southern shore of the Sea of Marmara southwards to the headwaters of the River Maeander and south-eastwards, through Lycaonia, to the north-western face of the Taurus Range; and the *Asiatic Hellespontine Hellenes* along the Anatolian shore of the Bosphorus, the Sea of Marmara, and the Dardanelles. The names of two other peoples in this district—the *Western Matiēnoi* within the southward bend of the River Halys and the enigmatic *Ligyes*—are added in the field-state of Xerxes' expeditionary force.²

¹ Arguments against the conjecture that this continental territory may be the *dahyāuš* designated by the label 'those in the Sea' are set out on p. 679, n. 1, below.

² See Herodotus, Book VII, chap. 72, and, for the Western Matiēnoi, also Book I, chap. 72. The evidence about the location of the Western Matiēnoi is examined in the Note on Chronology in x. 201. As for the Ligyes, it is not inconceivable that they might have been the left wing of the Latin-speaking people whose right wing comes into the light of history in the second century B.C. along the French and Italian Riviera and in the North-Western Apennines. The Hittites themselves were an Indo-European-speaking people of the centum group whose language—extant in some of the documents in the Hittite Imperial Archives retrieved at Boghazkal'eh—was considered by Modern Western philologists to have a closer affinity with Latin than with any other Indo-European language. In this connexion it might be noted that the Illyrians—another Indo-European-speaking people of the centum group who on the European side of the Black Sea Straits were at this time wedged in between the Italic and the Thracians—had also made their way into Anatolia, to judge by the name of the Mount Ellurya (i.e. Illyria) which figures in the political geography of the Hittite World in the second millennium B.C. as the scene of a battle between the Hittites and the Gasga in the sixteenth year of Mursil II's reign (see Delaporte, L.: *Les Hittites* (Paris 1936, La Renaissance du Livre), p. 122). An immigration of Illyrian peoples into Anatolia is also attested by the name of the Veneti, occupying a strip of the Anatolian coast to the east of the Mariandynoi, whom the field-state of the Trojans' allies in the Second Book of the *Iliad* (ll. 851-5) appears to equate

Another piece of information which confirms the official lists' testimony *ex silentio* that the Dascylitis was at this time united with Katpatuka is Ctesias' statement¹ that, as a prelude to Darius's campaign beyond the Bosphorus against the Scythian horde on the Great Western Bay of the Eurasian Steppe, the Viceroy of Cappadocia was sent on a naval reconnaissance; for the viceroyalty whose viceroy was selected for this mission is likely to have been the north-westernmost viceroyalty in the Achaemenian Empire within the imperial frontiers as these stood before Darius inaugurated the forward movement into Europe.

In the light of the divers pieces of evidence reviewed above, we may perhaps now take it as proven that the Achaemenian viceroyalty designated 'Cappadocia' by Ctesias in this passage embraced the whole of Herodotus's Taxation District No. 3, including the ex-Lyidian territory, to the west of the River Halys, that was administered from Dascylium.² But in the light of Herodotus's description of his Taxation District No. 13—if we have been right in interpreting this as the description of a viceroyalty which has been mistakenly applied by Herodotus to one of this viceroyalty's fiscal subdivisions³—we have now to ask ourselves whether the viceroyalty designated 'Cappadocia' by Ctesias may not have included other taxation districts besides Herodotus's District No. 3. If the formula 'Paktyikê and Armenioi and the adjoining peoples as far as the Black Sea' does in reality designate, not just a taxation district, but a viceroyalty embracing the three taxation districts numbered 13, 3, and 19 in Herodotus's gazetteer, then the viceroyalty in which Herodotus's Taxation District No. 3 was embraced will have united an ex-Lyidian Dascylitis not merely with an ex-Median Cappadocia, but with an ex-Median Armenia as well, and this viceroyalty will have extended eastwards from the eastern shores of the Straits not merely as far as the upper reaches of the Halys but as far as the eastern boundaries of an Achaemenian Armenia over against an Achaemenian Urartu and Adiabênê that were included in Herodotus's Taxation District No. 18 and in the Viceroyalty of Media.⁴ It will, in fact, have included all the country on the Asiatic side of the Straits that had been overrun by Phrygian invaders from Europe between the end of the thirteenth and the beginning of the sixth century B.C.

This conclusion that Armenia and Cappadocia-cum-Dascylîtide together constituted a single viceroyalty in Darius's day is not impugned by the appearance of both the names 'Arminiya' and 'Katpatuka' side by side in all our six official lists. We have already noticed⁵ that at least nine of the other *dahyāvā* named in the lists never constituted either separate viceroyalties or even separate taxation districts so far as we know; and, if Modern Western scholars were right in taking the repeated

with the Paphlagonians, and by the name of the city of Dardanus, which was to cling to the straits on whose Asiatic shore this Dardanian settlement had once stood.

¹ See Ctesias: *Persica*, Books XII–XIII, § 47 (16), in J. Gilmore's edition (London 1888, Macmillan), pp. 150–1.

² Professor G. G. Cameron comments: 'Almost—but not quite—I am fully persuaded now that the Greek Dascylium is Katpatuka.'

³ See pp. 604–11, above.

⁴ The *tracée* of these boundaries is discussed on pp. 660–7, above.

⁵ On p. 589, above.

juxtaposition of names of *dahyāva* in the lists—e.g. the juxtaposition of Suguda and Bākhtriš in all six—as evidence that *dahyāva* thus bracketed together were included in one and the same viceroyalty,¹ this would apply to Arminiya and Katpatuka, which are placed next to one another, in that order, in four out of Darius's five lists (namely in 'DB', 'DPe', 'DSe', 'DNa'), while in the fifth Darian list, 'DZd', they appear to have been separated only by the single name 'Yauna'. This is presumptive evidence that, at any rate down to the end of Darius's reign, Arminiya and Katpatuka, like Bākhtriš and Suguda, were combined to constitute a single viceroyalty.²

A viceroyalty of this size proved, however, too unwieldy to be retained intact. In the field-state of Xerxes' expeditionary force the constituent peoples of the Herodotean Taxation District No. 3 alone are already distributed among no less than four separate brigades—one consisting of the Paphlagonians and Western Matiēnoi and a second of the Mariandynoi, Ligyes, and Cappadocians, while the Asiatic Thracian contingent constitutes an independent command and the Phrygians are brigaded with the Armenians of Herodotus's Taxation District No. 13. At least as early as 408 B.C., when Cyrus the Younger was appointed by his father King Darius II to an extensive civil jurisdiction and military command in Anatolia, the original Viceroyalty of Armenia-cum-Cappadocia was broken up; for Cyrus the Younger was made Viceroy of Cappadocia and of 'Great Phrygia' (i.e. Southern Phrygia), but Northern (*alias* 'Hellespontine') Phrygia was not—though Lydia was—included in his sub-empire,³ and we may gather *ex silentio* that Armenia was not included in it either. By 401 B.C. the Viceroyalty of Cappadocia had been compensated for its loss of Armenia and the two Phrygias by having been enlarged, at the expense of the Kingdom of Cilicia, by the addition of the Tyanitis⁴ and therefore also, by implication, of Cilicia-

¹ See p. 589, above.

² Since it is hardly conceivable that the whole of a viceroyalty embracing Armenia can have been administered from Dascylium, at the far western extremity of its domain, we must suppose that Orctes of Sardis' contemporary Mitrabates of Dascylium was, not a viceroy in his own right, but the lieutenant-governor of a viceroy whose seat of administration was more centrally situated. 'Lieutenant-governor' is the literal meaning of the Greek word *ὑπαρχος*, by which Herodotus designates Mitrabates in Book III, chap. 126; and, considering the vagueness of the Hellenic usage of such terms, this interpretation is not invalidated by the use of the same designation in chap. 120 for Orctes, who was certainly a viceroy and not a viceroy's subordinate. Considering that the Dascylitis must have been detached by Cyrus II from Lydia as a precautionary measure to guard against the possibility of a repetition of Paktyas' revolt (see pp. 588-9, above), we should have expected *a priori* to find the Dascylitis not merely detached from a dissident viceroyalty but attached, in order to make assurance doubly sure, to some other viceroyalty on whose loyalty Cyrus II could rely—as we may presume that he could rely on the loyalty of Armenia, in virtue of his being Astyages' heir. Even as it was, Orctes found himself able to liquidate Mitrabates and re-annex the Dascylitis to the Viceroyalty of Sardis (Sparda) during the anarchic year 522-521 B.C. If the Dascylitis had been erected into a separate viceroyalty on its own account, and had not been attached to Armenia besides being detached from Lydia, it would have remained still more helplessly exposed to the risk of aggression by an ambitious viceroy of Sardis.

³ See Xenophon, *op. cit.*, Book I, chap. ix, § 7, cited on p. 183, n. 7, above, and in IX. viii. 548, n. 1. Considering that Pharnabazus, the governor of the Dascylitis, was not subordinated to Cyrus the Younger in 408 B.C., we may perhaps infer that Pharnabazus had already, before that, been a viceroy in his own right, and that his father Pharnacēs, who had been governor of the Dascylitis as early as the summer of 430 B.C. (see Thucydides, Book II, chap. 67), had previously enjoyed the same status.

⁴ See Xenophon, *op. cit.*, Book I, chap. ii, § 20.

on-Halys as well. By the same date, Armenia had not merely been detached from Cappadocia but had been partitioned into two separate viceroyalties, as we have seen.¹

The *dahyāuš* called *Sparda* in the official lists is Herodotus's Taxation District No. 2, whose constituent peoples are the *Mysoi*, *Lydoi*, *Lasonioi*, *Kabalioi*, and *Hygennees*.

The Spardiyā—whose name was adopted as the official label for this *dahyāuš* because it had already attached itself to Sardes, the city that was the seat of the local administration in virtue of having once been the capital of a Lydian Empire—were the western vanguard of the host of Eurasian Nomad peoples who had broken out of the Steppe into South-Western Asia between the Caspian Sea and the Pamirs before the end of the eighth century B.C.²

At their first emergence above our historical horizon, we see the Saparda (as the Assyrians called them), already poised on the western rim of the Iranian Plateau, astride the road leading down via Behistan towards Babylonia.³ In the third decade of the seventh century B.C. we find Esarhaddon battling with a coalition of Medes, Saparda, and Cimmerians under the leadership of the barbarian war-lord Kashtaritu (Khšathrita);⁴ and, though Assyria's victory in this round of the struggle was registered in the establishment of three new departments labelled Madai, Bit Kari, and Saparda, these territorial gains had all been lost again before 667 B.C.⁵ The next 150 years or so in the history of the Saparda are a blank; but, after leaving a trace of their westward passage in the course of those years in the Sevordi-k who long afterwards, in the eighth century of the Christian Era, were to assert themselves in Uti, in the angle above the confluence of the rivers Kur and Aras,⁶ the Spardiyā (as they are called in Old Persian) reappear in the Achaemenian official lists of *dahyāva* as the eponyms of a *dahyāuš* named Sparda at the western extremity of Anatolia in the country known in Greek as Lydia.⁷

¹ On p. 662, above.

² See pp. 608-10, above.

³ These Saparda will have been the right wing of the horde, if the same national name is to be detected in the 'Sabadioi' who are located by Ptolemy, *Geographia*, Book VI, chap. xi, § 6, in the south-east corner of Bactria.

⁴ See p. 653, with n. 2, above.

⁵ See Forrer, op. cit., p. 93; König, op. cit., pp. 27 and 37.

⁶ See p. 610, n. 2, above.

⁷ Professor G. G. Cameron comments: 'It is surely only by straining that one can connect the name of the *dahyāuš* Sparda with the Saparda in Media.' Certainly at first sight a mere accidental coincidence might seem to be the most likely explanation of the appearance of the same name in locations as far apart as Western Iran and Western Anatolia at dates separated by as long a Time-interval as 150 years. The writer offers the following reasons for thinking that a more probable explanation is to be found in the migration of a Nomad horde which had carried its name with it. (i) We know that at least one other horde, the Cimmerians, did in fact migrate, within those same 150 years, from Western Iran to Anatolia, carrying its name with it (see p. 610, n. 1, above). (ii) We know that the Saljūq Turks likewise travelled from Western Iran to Anatolia in the eleventh century of the Christian Era, and the Mongols of Hülāgū's horde in the thirteenth century. (iii) We know that in the Aras Basin, which both the Saljūqs and the Mongols traversed *en route*, the name that had made its appearance in the seventh century B.C. in Media as Saparda, and in the sixth century B.C. in Lydia as Spardiyā, was borne in the eighth century of the Christian Era by a then still extant people called Sevordi-k. The writer would submit that facts (i) and (ii) show that his explanation is credible, and that fact (iii) indicates that it is probable.

Sargon claims to have conquered Harhar and to have added Saparda to it in his sixth year (Luckenbill, op. cit., vol. ii, pp. 11 and 14). In a list of receipts of tribute

We must conclude that the Spardiyā had invaded Anatolia in company with their previous associates the Cimmerians, and that they had subsequently entered the service of Alyattes King of Lydia (*regnabat circa* 614–557 B.C.) to fight for him against their former comrades. This conjecture would explain not only how their name had come to attach itself first to the capital city of Lydia and eventually to Lydia as a whole, but also how Alyattes had managed to turn the tide in Lydia's favour in her struggle with her Cimmerian assailants and also to make a beginning of the conquest of the Hellenic city-states along the west coast.¹ Alyattes' Spardiyan *foederati* will have supplied Lydia with the redoubtable cavalry who, by 585 B.C., had won for her the dominion of all Anatolia west of the River Halys and of the Kingdom of Cilicia, except for a Lycia that was shielded by mountains² and for a Miletus that could feed itself from overseas. The Achaemenian official use of the name 'Sparda' to designate Lydia must have lived on in popular usage long enough for the Jews to label the diasporā in the Roman province of Asia 'Sephardim' (i.e. 'Saparda') to distinguish them from the 'Ashkenazim' in the Scythian³ wilderness into which some of the more adventurous spirits among the diasporā had been drawn by the commercial openings along the Roman Empire's Continental European frontiers.

The Eurasian Nomad origin of the Saparda, *alias* Spardiyā, gives us a clue to the provenance of one of the peoples located in the Achaemenian *dahyāuš* 'Sparda' by Herodotus. These 'Hygennees' of the gazetteer—who must also be the people whose name has dropped out of the text of the field-state between the Asiatic Thracians and the Kabêlees⁴—are manifestly the left wing of the Sigynnai whom Herodotus locates⁵ somewhere beyond the Danube, in the hinterland of the Veneti at the head of the Adriatic. In this remote north-western settlement the Sigynnai were still advertising their Eurasian Nomad origin by continuing to wear 'Median' (i.e. Sakan) dress. The missing link between these Sigynnai in the Austrian Alps and the Hygennees in South-Western Anatolia is supplied by Strabo's description⁶ of the Siginnoui whom, in company with the Derbikes and the Kaspioi, he locates somewhere in the east-west chain of mountains constituted by the Elburz and the Caucasus.⁷

during his eighth campaign (714 B.C.), Sargon records, as received from Saparda, 'prancing horses, swift mules, camels native to their land, cattle and sheep' (Luckenbill, *op. cit.*, vol. ii, p. 147). This is just the tribute that is to be expected from a Eurasian Nomad horde that has only recently erupted out of the Steppe. On the other hand, Professor Cameron's scepticism would be vindicated if Sargon's Saparda should prove to have been identical with the land of Shepardi which, together with Azalzi, was annexed to Assyria by Tukulti-Ninurta I in the thirteenth century B.C. (Luckenbill, *op. cit.*, vol. i, p. 152).

¹ See Herodotus, Book I, chaps. 15–16.

² See *ibid.*, chap. 28.

³ According to Prášek, *op. cit.*, vol. i, p. 115, n. 5, the 'Ashkenaz' in the latter-day text of Gen. x. 3 is a corruption of 'Ashkuz', which is the form in which the *nomen Scythicum* appears in the Assyrian records.

⁴ See Herodotus, Book VII, chap. 76.

⁵ Strabo: *Geographica*, Book XI, chap. xi, § 8 (C 520).

⁷ While Strabo's account of these Siginnoui agrees with Herodotus's account of his Sigynnai in the description of their peculiar breed of horses (see p. 688, below), the independence of Strabo's source is attested, not merely by the difference in geographical location, but also by the difference in the Hellenization of the name; by the labelling of the people's cultural affinity, not as 'Median', but as 'Persian'; and by the mention of

⁶ In Book V, chap. 9.

As for the other peoples mentioned in Herodotus's description of his Taxation District No. 2, the Mysoi, in the highlands between Lydia and Hellespontine Phrygia, are convicted, by the survival of their name in the Lower Danube Basin in the form 'Moesi', of having been one of the Phrygian-speaking barbarian peoples who had broken out of South-Eastern Europe into the north-west corner of the Hittite World in the second millennium B.C.

The Kabêlees, whose name reappears on the post-Alexandrine Hellenic map of Anatolia in the names Cabalia and Cibyra, to the north-west of the Lycian Milyas, and who figure on the Hittite map of Anatolia as the principality of Hapalla, must have occupied the country between the south-east border of Lydia and the north-west border of Pisidia. Herodotus associates the Kabêlees (Kabalioi) with the Lydians in calling both of them 'Mēiones',¹ and Strabo supports this association by his statement² that Lydian was one of four languages that were current in the Cibyrâtis. At the same time the Kabêlees also had cultural associations with their eastern neighbours, to judge by Herodotus's parade of both the Kabêlees and the Lasonioi in a Cilician equipment and by the presence of a detachment of Kabêlees at the eastern end of the Pamphylian coast, where there was another city named Cibyra.³

Herodotus's Lasonioi are as enigmatic as his Asiatic Ligyes. If they are not identical with the Kabalioi,⁴ the only space still vacant for them on the map is Pisidia, and the only name of which their name is reminiscent is 'Rasena', which is said to have been the Etruscans' own name for themselves. This conjectural location and conjectural affinity are at any rate not incompatible with one another; for the only section of the coastline of Anatolia from which the Anatolian progenitors of the Etruscans could have taken to the sea was the section between the eastern end of the Greek settlements along the coast of Pamphylia and the northern end of the Phoenician settlements along the coast of Syria.⁵

The *dahyāuš* called the *Yaunā who are on the Mainland* ('Yaunā tyaīy uškahyā') in Official List 'DPe', and, with less precision, the *Yaunā sans phrase* in 'DSe' and 'XPh' and *Yauna* (i.e. the name of the country, not the people) in 'DB' and 'DNa', is coextensive with Herodotus's Taxation District No. 1, constituted by the *Iónes*, *Asiatic Magnêtes*, *Aiolees*,

points that are not mentioned by Herodotus—e.g. that their chariots are four-horse chariots, that the charioteers are women, that the best female charioteer is rewarded by being given licence to practise sexual promiscuity, and that they indulge in cranial deformation. Strabo's testimony to the existence of 'Siginnoi' who were Persian in their culture and who lived somewhere within or immediately adjoining what had once been the domain of the Achaemenian Empire is corroborated by the name of Themistocles' confidential slave Sikinnos (see Herodotus, Book VIII, chaps. 75 and 110), who is described in Plutarch's *Life of Themistocles*, chap. 12, as being 'a Persian by birth', and whom Themistocles employs as his go-between in his secret negotiations with Xerxes in 480 B.C. On the analogy of the latter-day Attic slave-names that were Latinized as 'Davus' and 'Geta', the name 'Sicinnus' would inform us that Themistocles' confidential agent was by birth a member of an ex-Eurasian Nomad people akin to the Getae and the Dahae.

¹ Herodotus, Book VII, chaps. 74 and 77.

² See Strabo: *Geographica*, Book XIII, chap. iv, § 17 (C 631).

³ See *ibid.*, Book XIV, chap. iv, § 2 (C 667).

⁴ Herodotus seems to identify them with the Kabêlees in the field-state (Book VII, chap. 77), though he gives no indication of their being identical when he mentions the Kabalioi and the Lasonioi side by side in the gazetteer (Book III, chap. 90).

⁵ See I. i. 114, n. 3.

Kâres, Lykioi, Milyai, and Pamphyloi (the *Asiatic Dorians* are added in the field-state).¹ All these peoples, including the non-Greek-speaking Carians, Lycians, and Milyans, were Hellenes or sub-Hellenes in culture, and all of them except the Milyai were on the seaboard. The Milyai, who on the post-Alexandrine Hellenic map of Anatolia survive in the immediate hinterland of the Lycian coast and in Western Pisidia,² will have been a refugee remnant of the eponymous people of a country called *Mirâ* which, on the Hittite map of Anatolia, had perhaps extended as far north as the upper course of the Phrygian Cayster in the neighbourhood of *Afyun Qāra Hisār*.³

In the three latest of the official lists—‘DSe’, ‘DNa’, and ‘XPh’—the name *Karkā*, as well as the name *Yauna* or ‘the *Yaunā*’ (*sans phrase*), makes its appearance; and, if the identification of *Karkā* with *Caria* is correct, the introduction of the name signifies that the original *dahyāuš* *Yauna* had been partitioned and that the detached portion, now labelled ‘*Karkā*’, was made up of the last four peoples named in Herodotus’s description of his First Taxation District. The reduced *Yauna* and the new *Karkā*, between them, like the original *Yauna*, will have extended round the Aegean coast of Anatolia and the western half of its Mediterranean coast continuously, all the way from the southern border of the Asiatic Hellespontine Hellenes in the taxation district *Dascylitis-cum-Cappadociā* to the western frontier of the seaboard of the Kingdom of *Cilicia*. The *dahyāuš* known as *Sparda* will thus have been completely landlocked; but there is no evidence that any of the cantons of *Yauna* and *Karkā*, except *Caria Proper* and *Lycia*, were ever under the administration of any other authority than the Viceroy of *Sparda*. In practice, *Sparda*, the whole of a reduced *Yauna*, and at least the *Pamphylian* canton of *Karkā* seem usually to have constituted a single vicerealty; and this association is indicated in the official lists by the immediate juxtaposition to one another of *Sparda* and *Yauna* in ‘DB’, ‘DPe’, ‘DSe’, and ‘DNa’, and their separation only by a single intervening name in ‘DZd’, and ‘XPh’.

Though, even in combination, these three *dahyāva* covered a very small area by comparison with the size of the taxation district *Cappadocia-cum-Dascylitide*, and *a fortiori* with the size of the Vicerealty *Arminiya-plus-Katpatuka*, the ratio between the two Anatolian vicerealties, as measured in human terms of population and wealth, is indicated by Herodotus’s figures. The combined annual assessment of his Taxation Districts Nos. 1 and 2 is 900 *Euboic talents*—200 more than the assessment on *Egypt* and only 100 less than the assessment on *Babylonia*⁴—while the combined annual assessment of Herodotus’s

¹ See Herodotus, Book VII, chap. 93.

² See Strabo: *Geographica*, Book XIII, chap. iv, § 17 (C 631), and Book XIV, chap. iii, § 9 (C 666).

³ See ‘A note on Hittite Sites and Locations on Maps 15–16’, in vol. xi.

⁴ The mercantile and industrial seaboard of the Achaemenian Empire from the Black Sea Straits to the Philistine coast inclusive, together with the Empire’s two great cereal-producing vicerealties, *Egypt* and *Babylonia*, would appear to have been on a markedly higher level of wealth than the peoples of the interior on the Iranian, Armenian, and Anatolian plateaux, if the equipment paraded in the field-state of *Xerxes*’ expeditionary force may be taken as an approximate indication of comparative standards of living, and

three Taxation Districts Nos. 3, 13, and 19 amounts, notwithstanding the enormously greater extent of their aggregate area, to only 1,060 talents in all—that is, to only 160 talents more than the combined figure for Districts Nos. 1 and 2.

The *dahyāuš* called *Those in the Sea* ('tyaiy drayahyā') in 'DB', 'DPe', and 'DSe', and *Those who live in the Sea* ('tya[iy] drayahiyā dārayatiy') in 'XPh', must be identical with *the Isles* (Nêsoi) in the Aegean Archipelago¹ which are mentioned by Herodotus, in an appendix to his

if body armour and metal helmets may be taken as the two criteria of affluence. On this test the western seaboard, Egypt, and Babylonia stand out against the foil of their vast poverty-stricken north-eastern hinterland. It is also noticeable that, among the non-Hellenic peoples of the western seaboard, the specifically Hellenic type of elaborate and costly equipment is gaining ground. It is worn by the Philistines and Phoenicians (Herodotus, VII. 89), as well as by the non-Greek-speaking Cilicians (VII. 91), Lycians (VII. 92), and Carians (VII. 93), and by the Greek-speaking but imperfectly Hellenic Cypriots (VII. 90).

¹ The locative case of the Old Persian word 'draya', 'sea', must mean 'in the Sea' in the sense in which an island is in the sea. It could not mean 'on sea' in the sense in which Boulogne was 'on sea' in virtue, not of being surrounded by the water like an island or floating on the water like a ship, but of standing on the continent, though on the coast of it. When the draftsman wants to describe the continental Yaunā as being situated on the coast, he does this by using the locative, not of the word 'sea', but of the word 'mainland'. He calls them 'Yaunā tyaiy uškahyā' (in 'DPe': see p. 677, above). To convey this meaning through the use of the word 'sea' he would have had to introduce a preposition meaning 'alongside of' or 'near' to govern the substantive. Moreover, the label 'those alongside of the sea', if the draftsman had used it (and as a matter of fact he did not use it), would have been useless as a distinguishing mark; for, whereas the Aegean Archipelago was the only *dahyāuš* in the Achaemenian Empire that lay *in* the sea, there were at least eighteen *dahyāva*, even before the separation of Hellespontine Phrygia from Cappadocia, that were *on* sea in the sense in which Boulogne was on sea. Besides Cappadocia, the viceroyalties or taxation districts or autonomous territories of Sparda together with 'the Yaunā on the Mainland', Karkā, Cilicia, Syria, Arabāya, Egypt, the Coastal Peoples north of Armenia, Colchis, Kaspianē, Parthia-cum-Hyrcaniā, the Pointed-Hood Sakā, Babylonia, Hūja, Pārsa, Harahvatiš-cum-Maka, the Asiatic Ethiopians, and Hīduš all had seaboard on some sea or other: the Sea of Aral, the Caspian Sea, the Black Sea, the Sea of Marmara, the Aegean Sea, the Mediterranean, the Red Sea, the Persian Gulf, the Indian Ocean. If it had occurred to Darius to label any of these continental *dahyāva* with a sea-front 'the viceroyalty on the seaside' *par excellence*, the *dahyāuš* on which he would have conferred this title would certainly not have been the Dascylitis-cum-Cappadociā. It would have been Hīduš, the viceroyalty which he himself had added to the Empire for the sake of its seaboard on the Ocean—a seaboard that was invaluable for Darius because the acquisition of it had enabled him to open an oceanic line of communications between the eastern and western extremities of his dominions.

Professor G. G. Cameron comments: 'Your note is by no means convincing. We are scarcely in a position to put ourselves in a draftsman's shoes.' And a chronological point telling against the identification of the *dahyāuš* called 'those in the Sea' with the islands of the Aegean Archipelago has been brought to the writer's attention in the following comments by Professor R. G. Kent:

'Regarding your equation "tyaiy drayahyā = those in the Sea", I note that, while the term occurs in the "DB" list, at the very beginning of Darius's reign, Herodotus says specifically, in Book III, chap. 96, that "as time went on, however, other revenue came in also from islands and from the peoples living in Europe as far as Thessaly". This seems to me to indicate that the twenty districts did not, at the time of Darius's accession, include any significant island element, certainly not enough to have a place in the "DB" list. Therefore I cannot yet abandon the interpretation that George Cameron gave me, possibly starting from our late friend A. T. Olmstead, that "tyaiy drayahyā" means "those by the Sea", namely a section with their capital at Dascylium. As Dascylium seems to be associated with certain lakes (see any classical dictionary s.v. Dascylium or Daskylon), the term "those by the Sea" might not be very inexact after all. Further, the islanders were no very important element in the Persian Empire, as they contributed only 17 triremes to the Persian fleet (Hdt. VII. 95), whereas even the Pamphylians and the Asiatic Dorians each contributed 30, and no other national or territorial unit sent less than 50.'

In answer to this objection of Professor Kent's, the present writer would venture to

gazetteer,¹ as one of the new districts subsequently added to Darius's original twenty. In the field-state, in which the Islanders (Nesiôtai) duly appear among the naval contingents,² they are explicitly described as being Ionians of the same Athenian origin as the Ionians of the Anatolian mainland, and as wearing the Hellenic equipment.

When the five Old Persian texts in the official lists are checked off against one another, it becomes clear³ that, besides Herodotus's literal translation 'the Islanders', 'those in the Sea' have a second synonym in 'the toque-wearing Yaunā' ('Yaunā Takabarā') who figure in 'DNa'—the only one of these five lists in which 'those in the Sea' do not appear. The headgear of the Achaemenids' far western subjects, the Hellenic

recall that, while Herodotus does speak of the tribute from the Aegean islands as being supplementary and subsequent to the tribute assessed by Darius on his original twenty taxation districts, Herodotus also goes on to indicate that Darius embarked on his forward policy in Hellenic waters almost immediately after he had completed the effective reassertion of his authority throughout the Achaemenian Empire. The sequence of events, as Herodotus gives it, is (i) the liquidation of Oroetes the satrap of Sparda, who had been Cyrus's appointee and who had played for his own hand during the interregnum between Cambyses' death and Darius's triumph (III. 126–8); (ii) the deportation of Dēmocédēs from Sardis to Susa (III. 129); (iii) the dispatch of a naval reconnoitring expedition from Sidon, with Dēmocédēs on board, which made a systematic survey of the coasts of the Hellenic World and penetrated as far to the west as Dēmocédēs' homeland Crôtôn on 'the ball' of 'the toe' of Italy before its activities were brought to an end by Dēmocédēs' machinations (III. 136–8); (iv) 'after this, Darius made the first of his annexations of foreign territory, Hellenic or non-Hellenic, by occupying Samos' (III. 139). From this sequence of events in Herodotus's narrative two points seem to emerge: (i) the annexation to the Achaemenian Empire of one important Aegean island, Samos, occurred rather soon after Darius's effective assertion of his sovereignty over Sparda and 'the Yaunā on the mainland' (who must also have been under Oroetes' jurisdiction before his liquidation); (ii) the annexation of Samos was the second move in a deliberate and ambitious plan for a forward policy of maritime expansion in the Hellenic World (see further IX. viii. 433–4), in which the first move had been the dispatch of a naval reconnoitring expedition to Magna Graecia. It seems not improbable that the list of *dahyāva* in 'DB', in which 'those in the Sea' already figure, was not inscribed until after the annexation of Samos. The mighty work at Behistan, where the cliff-face had to be chiselled smooth before the long record was inscribed on it, must, after all, have taken a considerable time to carry out; and, if, by then, Samos was already in Darius's hands, that might have sufficed, in his eyes, to justify the mention, in 'DB', of a new *dahyāva* of which Samos was, in Darius's ambitious intentions, only a first instalment.

As regards Professor Cameron's identification of 'those in the Sea' with the inhabitants of the territory whose capital was Dascylium, the test of its convincingness is, surely, the applicability of this descriptive appellation, not just to Dascylium itself (whether the south shore of the Sea of Marmara or the north-east shore of Lake Manyas was the site of this local administrative centre), but to the whole of the area that the Governor at Dascylium administered. If we are right in thinking that the Dascylitis was part of a viceroyalty embracing Cappadocia and Armenia (see pp. 671–7 above), this will have been one of the most conspicuously 'continental' and 'non-maritime' viceroyalties of the Achaemenian Empire; and, even if the Dascylitis at this date had already constituted a separate viceroyalty confined to Hellespontine Phrygia, the metropolitan area—which was the great plain stretching east and west from the foot of the Mysian Olympus to the east bank of the River Granicus—would have been most unlikely to suggest the descriptive label 'in the Sea', since, although the plain does run parallel to the south shore of the Sea of Marmara, it gives the visual impression of being landlocked because it is secluded from the Marmara by a coastal range of hills. The sea is out of the picture, as the present writer could testify from a first-hand acquaintance with the country. He knew the eastern end of the great plain well, and he had also had two glimpses of the western end—the first between 3.0 and 4.0 p.m. on the 22nd April, 1923, *en route* by train from Izmir (Smyrna) to Bandırma (Panormos) and the second on the evening of the 28th October, 1948, when the view was not good enough for him to catch a bird's-eye view of the landscape *en route* by air from Athens to Istanbul.

² See Book VII, chap. 95.

³ For visual evidence, see the masterly Table II in Kent, R. G.: 'Old Persian Texts IV: the Lists of Provinces', in the *Journal of New Eastern Studies*, vol. ii, January–October 1943 (Chicago 1943, University of Chicago Press), pp. 302–7.

islanders, like the headgear of their far north-eastern subjects the Mas-sagetan Sakā Nomads ('Sakā Tigrakhaudā', 'the Pointed-Hoods'), must have struck the Imperial Authorities as being so quaintly distinctive as to warrant the use of an allusive nickname as an official label. The word 'toque', which was the current French name for the headgear that, in A.D. 1952, was still being worn by members of the legal profession in France and by shepherds and brigands in Baluchistan, informs us that the authentic 'taka' was the fluted outward curving tall hat—a top-hat without a brim—in which the Persians are portrayed on Achaemenian bas-reliefs; but there is evidence that the Aegean Islanders' peculiar headgear, notwithstanding the official designation of it as a 'taka', was not, in fact, this Persian 'stove-pipe' hat, but was the low-crowned or crownless broad-brimmed hat that was known in Greek by the alternative names 'kausia' ('scorcher') and 'petasus' ('wide-awake'). In the Akkadian version of 'DNa' the Old Persian words 'Yaunā Takabarā' are paraphrased in the words 'the Second Ionians who wear shields on their heads'.¹ To post-Alexandrine Athenian eyes the crownless variety of the same headgear, as worn by an impostor dressed up as an Asiatic Macedonian from Seleucia, looked like a mushroom.²

This mushroom-like or shield-like Aegean insular headgear was to have a romantic history in a post-Achaemenian age. From the Archipelago the fashion spread westward to Attica—as is attested by its appearance here and there, on the Elgin Marbles, upon the heads of riders in the Panathenaic procession—and northward to Macedonia, where it became so characteristic a feature of the national dress that—'gorgeously transfigured'³—it established itself as one element in the royal insignia.

'As worn by the kings, it was dyed crimson with the precious juice won by immense labour from the sea, and the diadem was in some way tied round it or under it, its ends hanging loose about the neck. The diadem itself was inwrought with golden thread.'⁴

The sudden replacement of the Achaemenian Empire by a bevy of Macedonian successor-states, founded by officers who had served under King Alexander, ennobled a headgear that had once been the quaint monomark of one of the most outlandish of all the Achaemenian Empire's subject peoples into the sovereign emblem of royalty throughout an *Oikoumenē* extending from the Nile to the Ganges;⁵ and in

¹ '[matu]Ja-ma-nu ša-un-tū ša ma-ġi-na-ta ina qaqqādi-šu-nu na-šū-u.'

² See Plautus: *Trinummus*, Act III, scene iii, ll. 43–44, and Act IV, scene ii, ll. 3 and 9–10. When the sycophant makes his appearance in his Asiatic Macedonian outfit, Charmides exclaims:

Pol, hicquidem fungino generest: capite se totum tegit.

Hilurica facies videtur hominis, eo ornato advenit.

This crownless variety of the 'petasus' is portrayed on coins of King Antimachus, the brother, and King Demetrius II, the son, of King Demetrius the Euthydemid Bactrian Greek conqueror of the Mauryan Empire (see the plate of coin-portraits following p. 539 in Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press)).

³ Bevan, E. R.: *The House of Seleucus*, vol. ii, p. 274.

⁴ Ibid. Cp. Bouché-Leclercq, A.: *Histoire des Séleucides* (Paris 1913, Leroux, 2 vols.), vol. i, p. 475.

⁵ This romantic change in the significance of the petasus came to be reflected in a

A.D. 1952, nearly two thousand years after the fall of the last of the post-Alexandrine Macedonian *peritura regna*, the petasus—duly dyed purple and duly girt with a diadem whose ends hung loose in a symmetrical pair of pendant tassels—could still be seen, on state occasions, adorning the heads of the ecclesiastical princes of a Roman Christian Church under the latter-day name of ‘the cardinal’s hat’.

In ‘DPe’ ‘the Yaunā who are on the Mainland’ and ‘those in the Sea’ (described in ‘DNa’ as ‘the shield-shaped-toque-wearing Yaunā’) are distinguished both from one another and from another *dahyāuš* called ‘the Lands that are beyond the Sea (dahyāva tyā para draya)’ with complete clarity in the sequence ‘the Yaunā who are on the Mainland and those in the Sea and the Lands that are beyond the Sea’. This third formula recurs in ‘DSe’ as ‘those who are beyond the Sea (tyaiy para draya),’ and in ‘XPh’ as ‘those who live beyond the Sea (tyaiy para draya dārayatīy),’ while ‘DNa’, which designates ‘those in the Sea’ as ‘the shield-shaped-toque-wearing Yaunā’, designates ‘those beyond the Sea’ as ‘the Sakā beyond the Sea (Sakā tyaiy para draya)’. The Nomads to whom the word ‘Sakā’ in this phrase refers cannot be identified for certain. We cannot tell whether they are the Scyths on the Great Western Bay of the Eurasian Steppe to the north of the Black Sea or the Getae in the Lower Danube Basin (an advanced guard of the Massa-getae on the Oxus) or the Odrysae in the valley of the River Maritsa (*Graecè* Hebros). Whatever the reference here may be, it is clear that, just as the undifferentiated ‘Sakā’ of ‘DB’ and ‘DPe’ are sorted out in ‘DSe’, ‘DNa’, and ‘XPh’ into ‘Hauma-(?)drinking Sakā’ and ‘Pointed-Hood Sakā’, so, in the same three later lists, the undifferentiated ‘Lands that are beyond the Sea’ of ‘DPe’—which is rendered by Herodotus as ‘the peoples living in Europe as far as Thessaly’¹—are sorted out into an easterly overseas *dahyāuš*, to which ‘DNa’ applies the name ‘Sakā’, and a westerly one which is called ‘Skudra’ in ‘DSe’, ‘DNa’, and ‘XPh’ alike.

The location of this last-mentioned Achaemenian *dahyāuš* is established by the reappearance of its label in Ptolemy’s geography and in Stephanus of Byzantium’s gazetteer as the name of a Macedonian townlet that is just not too obscure to be ignored. Ptolemy² locates this townlet called Skydra in Emathia, and mentions it between Tyrissa and Myeza. The Achaemenian Empire’s loss of all Darius’s Continental European acquisitions except Doriscus³ as a consequence of the disaster of 480—

corresponding change in the connotation of the term by which it had been designated in ‘DNa’. The Old Persian compound word ‘taka-barā’, used in this context to describe a subject people wearing a peculiar national head-dress, was taken over into the Armenian language in the form ‘t’agawor’ to denote the wearer of the ‘taka’ in the different sense of a king’s crown. ‘In Armenian the word “t’agawor” is the usual word for “king” ... The takfūr of Sis is, of course, the Armenian “t’agawor”, Old Iranian [actually, not Old Iranian, but Middle Iranian or Pahlawi, as Professor Kent points out—A.J.T.] “taga-bara”, “crown bearer”’ (Frye, R. N., in the *Harvard Journal of Asiatic Studies*, vol. x, No. 2, September 1947, pp. 237 and 236). In Ottoman Turkish the same compound word was taken over in the form ‘tekfūr’, and was used in the Armenian, as distinct from the Achaemenian, sense as a technical term to denote the East Roman Emperor. For example, in Turkish the ruin of the East Roman Imperial Palace Blachernae was called ‘Tekfūr Serayī’, and Mount Ganos, on the European shore of the Sea of Marmara, ‘Tekfūr Dağı’.

¹ Herodotus, Book III, chap. 96.

² *Geographia*, Book III, chap. xiii, § 39.

³ See Herodotus, Book VII, chaps. 105-7, cited on p. 120, above.

479 B.C. was to cost Skydra the fulfilment of a manifest destiny. In the choice of Skydra for the seat of administration of a province that was intended soon to include the whole of Continental European Greece, the lieutenants of Darius who were organizing his new Continental European dominions for him showed the same eye for the structure of the military and political geography of the Balkan Peninsula as Ghāzi Evrenòs, the lieutenant of the Ottoman Sultan Murād I (*imperabat* A.D. 1360–89), was to show when he established a powerful Ottoman military colony on the same Emathian plain at Yenijé Vardar,¹ in the neighbourhood of the site of Pella. Emathia, as King Philip Amyntou of Macedon was to demonstrate, afforded a base of operations from which a land power could dominate Continental European Greece in one direction and the Morava Basin in another. If Xerxes had been as successful as either Philip or Murād I in his empire-building enterprise in South-Eastern Europe, an Achaemenian Skydra might have lived to play as great a part in history as a Macedonian Philippi or Philippopolis or as a Roman Lugdunum or Colonia Agrippina.

If we now cast our minds back over this survey of the administrative geography of the Achaemenian Empire, we can perhaps make out the lineaments of the viceroyalties, as well as the taxation districts, into which it was divided during the period of forty-two years between the disaster of 522–521 B.C. and the disaster of 480–479 B.C. The viceroyalties in this period were large in size and consequently few in number. They were:

I. Greater Media, including Adiabênê, Urartu, the Hyspîrîtis, and the Lower Aras-Kur Basin, as well as Media Proper, and embracing Herodotus's Taxation Districts Nos. 10, 11, 15, and 18.

II. Greater Elam, including Anšan and Parsuwaš, and coextensive with Herodotus's Taxation District No. 8.

III. Harahvatiš, including Zrāka, South-Eastern Pārsa, and Makran as well, and embracing Herodotus's Taxation Districts Nos. 14 and 17.

IV. Parthava, including Gurgān, Dihistān, Khwārizm, and Herat as well, and coextensive with Herodotus's Taxation District No. 16.

V. Bākhtiř, including Suguda and Marguř as well, and coextensive with Herodotus's Taxation District No. 12.

VI. The Indus Basin, consisting of Gādāra and Hīduř, and embracing Herodotus's Taxation Districts Nos. 7 and 20.

VII. Pahat Babili u Ebir-nari, consisting of Bābiruř together with Athurā, and embracing Herodotus's Taxation Districts Nos. 9 and 5.

VIII. Egypt together with Libya, coextensive with Herodotus's Taxation District No. 6.

¹ *Graecè* Yanitzá (see Khalkokondhýlis, 'Laónikos' (i.e. Nikólaos): *De Origine et Rebus Gestis Turcarum*, Book IV, *ad finem*, on p. 218 of I. Bekker's ed. (Bonn. 1843, Weber); Hammer, J. von: *Histoire de l'Empire Ottoman*, vol. i (Paris 1835, Bellizard, Barthès, Dufour et Lowell), pp. 224–5; Gibbons, H. A.: *The Foundation of the Ottoman Empire* (Oxford 1916, Clarendon Press), pp. 146–7; Mordtmann, J. H., s.v. 'Evrenos', in *The Encyclopaedia of Islam*, vol. ii (London 1927, Luzac), pp. 34–35).

IX. 'Paktyiké and Armenioi and the adjoining peoples as far as the Black Sea', embracing Herodotus's Taxation Districts Nos. 13, 19, and 3.

X. Sardis, together with 'the Yaunā who are on the mainland' and Karkā, embracing Herodotus's Taxation Districts Nos. 1 and 2.

As for 'Those in the Sea' and 'The Lands that are Beyond the Sea', these two titles would seem, like the names of the two Roman provinces Germania Superior and Germania Inferior, to commemorate ambitious programmes of conquest which were frustrated at an early stage, and the title Sakā Tigrakhaudā may be placed in the same category, considering how unlikely it is that Darius I's punitive expedition against Skunkha will have had any lasting results.

The Achaemenian Empire's Historical Background

Our survey of the administrative geography of the Achaemenian Empire has also brought to light some of the reasons why Cyrus II was able to extend his rule so rapidly and easily over so vast an area and why thereafter Darius and Xerxes, when they set out to add new dominions to Cyrus's bequest, ran up against unforeseen limits which they found themselves unable to pass. The area which Cyrus had conquered and which Darius had resubjugated after a sharp recrudescence of anarchy in 522-521 B.C. was an area in which the hearts of the population had been prepared by previous sufferings for the acceptance of an oecumenical peace at almost any price. From the Indus Basin to 'the Yaunā on the Mainland', and from Egypt to the countries lying under the lee of the Caucasus, the peoples' spirit had been broken by one or other or both of two scourges: the third bout of Assyrian militarism that had been launched by Tiglath-Pileser III in 745 B.C., and the third eruption of aggressive Nomad peoples from the Eurasian Steppe, which had broken upon the eastern frontiers of Assyria and Urartu *circa* 715-714 B.C. The peoples who had come within the range of either the *furor Assyriacus* or the *terror Scythicus* had been schooled to become the Achaemenian Empire's victims or beneficiaries, in whichever of the two alternative lights they might look upon a fate that was mild by comparison with Assyrian cruelty or Cimmerian savagery, however poorly it might compare with idealized memories of a parochial sovereign independence that had long ago ceased to be practical politics. But the expectations of docility which the Achaemenian empire-builders had come to take for granted as a result of their facile successes in a psychologically devastated area were rudely disappointed as soon as they attempted to impose the same oecumenical peace outside the limits within which the Assyrians and the Sakas had ploughed up the ground for them.

Cyrus II himself, for example, paid with his life for his failure to foresee that, when he attacked the Eurasian Nomads on their own *terrain*, he was going to encounter a much more vehement resistance than had been offered to him by neighbouring sedentary peoples for whom their submission to his dominion had brought with it some

security against Nomad raids in compensation for the loss of an illusory national independence. Darius I was lucky to escape with his life when—emboldened, perhaps, by his success in momentarily subduing ‘the Pointed-Hood Sakā’ on the River Oxus and the Aral Sea, who had been Cyrus’s bane—he went on to attack the more distant ‘Sakā beyond the Sea’ on the Great Western Bay of the Eurasian Steppe. Finally, Xerxes brought upon himself a disaster from which the Achaemenian Empire did not ever completely recover when he tried to deal with the Continental European Hellenes, who had never felt the touch of either the Assyrian or the Scythian lash, as Cyrus had found himself able to deal with ‘the Yaunā on the Mainland’, who had previously been broken in by the Cimmerians and the Spardiyā.¹ In their encounters with unbroken peoples, whether sedentary or Nomad, the Achaemenidae were only successful in so far as they showed a politic generosity. Their Arab neighbours, for instance, to whom they accorded the status of autonomous allies, do not seem to have given them the trouble that these Arabs’ forebears had given to high-handed Assyrian militarists; and ‘the Hauma-(?)drinking Sakā’ of Farghānah, to whom the same status had been accorded by Cyrus II, proved their faithfulness to the alliance by fighting magnificently for the last Darius at Gaugamela in 331 B.C.

The historical importance of the Eurasian Nomad Völkerwanderung of the eighth and seventh centuries B.C. is one of the features in the background of the Achaemenian Empire that our survey has thrown into relief.² When Darius boasted that ‘a Persian fighting-man’s spear has pressed forward far’,³ a Massagetan Skunkha might have commented—if his ruthless Achaemenian conqueror had left him life in his body and a tongue in his head—that the Saka fighting-man’s battle-axe had pressed forward farther. The Persians might have caught up and conquered the Sindoi on the shore of an ocean which was to be labelled with the Sindians’ name when Darius’s admiral Scylax sailed on over it to the Red Sea coast of Egypt; but they had never come within striking distance of the Sindians’ right wing on the banks of the Kuban. ‘The peoples to the north of the Caucasus snap their fingers at the Persians down to this day’, as Herodotus wrote at some date during the reign of Xerxes’ successor Artaxerxes I.⁴ Again, the Persians might have caught up and conquered the Thatagu[? d or v]iyā on the cow-pastures of the Panjab, but they had never subjugated the Kuru on their plain between the Sutlej and the Jumna. They might have caught up and conquered the advance-guards of the Scyths, Cimmerians, Paktyes, and Spardiyā in Anatolia, but they had been foiled by the Scyths’ right wing on the steppe to the north of the Black Sea. They might have momentarily imposed their rule on the Odrysi in the Maritsa Basin

¹ The psychological limit to Achaemenian annexations that was set by the physical limits of previous Assyrian and Eurasian Nomad ravages is noticed again in IX. viii. 430–1.

² Professor G. G. Cameron comments: ‘The Völkerwanderung of the eighth and seventh centuries is, I see, to you, as it is to me, a terrific development hitherto insufficiently emphasized.’

³ ‘DNa’, §4, quoted on pp. 589–90, above.

⁴ Herodotus, Book III, chap. 97.

and even on the advance-guard of the Getai in the Lower Danube Basin,¹ but the solitary² lost tribe of the Odrysi on the Hungarian Alföld had remained immune, and 'the Great Horde' of the Getai—the Massagetai whom the Persians called 'the Pointed-Hoods'—quickly shook off an ineffective Persian yoke. The Achaemenian tax-collectors had never come near the Agathyrsoi, and we may guess that they were not able to pester the 'Pointed-Hoods' for more than a few years.

It will be seen that Skunkha could have made a telling retort to Darius, and he could have crowned it by reminding him that, where the Eurasian Nomad invaders in *partibus agricularum* had eventually been brought to heel by sedentary Powers, this had been achieved through the prowess of renegade Nomads who had enlisted in these sedentary Powers' service. If the Lydian Monarchy had broken the force of the Cimmerian horde in Anatolia and had imposed its own rule as far eastward as the River Halys, the Lydians had owed their success to the valour of their mercenary Spardiyā Nomad cavalry;³ and, as for the conquest of the World by the elder branch of the House of Achaemenes, did not the alternating names Kūruš and Kambūjiya, borne by their princes from Cyrus I onwards, testify that their fortune had been made for them by the valour of Kuru and Kamboja Nomad reinforcements?⁴

In order to take the full measure of the impetus of this Eurasian Nomad Völkerwanderung that carried the Achaemenidae into power in South-West Asia, we have to remind ourselves that this was not the only front on which it had erupted. In the opposite hinterland of the Steppe, in the Upper Basin of the Yellow River, it had broken eastwards upon the Chóu Power in 771 B.C.,⁵ more than half a century before it had broken westwards upon Assyria and Urartu. This eruption in the eighth century B.C. was comparable in violence to the eruption in the eighteenth or seventeenth century B.C. which had carried the 'mariannu' into Anatolia and Syria and the Mitanni into Anatolia and Mesopotamia, if not into Midian.⁶ On the other hand, in contrast to both these eruptions, the intervening eruption, which had carried the ancestors of the Medes and Persians out of the Eurasian Steppe on to the Iranian Plateau, must have been relatively mild; for their advent left no mark on the Assyrian records; as we have seen,⁷ the Assyrians do not mention them earlier than the third quarter of the ninth century B.C., and then only because the Assyrians themselves have pushed their way up on to the plateau, and not because the Medes and Persians have descended upon the plains. The only trace of Medo-Persian penetration to the west of the Zagros Range before the eve of the overthrow of Assyria

¹ See Herodotus, Book IV, chaps. 92-96.

² Supposing that 'ag-' in the name rendered 'Agathyrsoi' in Ionic Greek may be equated with the Sanskrit 'éka-' meaning 'one'. For the relation between the Agathyrsoi and their namesakes the Odrysi (in the rendering of whose name the d is the Macedonian Greek equivalent of an Ionic Greek th), see III. iii. 425, n. 2.

⁷ On p. 608, n. 3, above.

in the seventh century B.C. is the appearance, in the annals of Tiglath-Pileser III (*regnabat* 746–727 B.C.), of the two personal names Kundašpi and Kuštašpi in Kummukhu (Commagênê), between the western elbow of the River Euphrates and the south-east face of the Taurus Range.¹

Can we account for this striking difference in degree of force between the first and third eruptions on the one hand and the second eruption on the other? The explanation may be that, in the Medo-Persian Völkerwanderung, the invading Nomads were not equipped, as they were in the other two Völkerwanderungen, with a potent new weapon. In the eighteenth or seventeenth century B.C. it was their chariotry, and in the eighth century B.C. their cavalry, that enabled the Nomad invaders to carry all before them;² but we know of no comparable Nomad military invention in the intervening bout.

To break in the wild horses of the Steppe, and to invent a spoked wheel light enough to be drawn at a gallop yet strong enough not to break, were two *chefs-d'œuvre* of human skill.

The mane that shaketh
For his slave he taketh.³

The breaking-in of chariot-horses was, however, only the first of two great achievements in the Eurasian Nomad's handling of the horse. His second achievement was to breed a horse with a strong enough backbone to carry a rider in battle instead of merely conveying him to the battlefield on wheels.

'When we first meet it in Egypt, very soon after its introduction [by Maryanni Eurasian Nomads], the horse was a small and very lightly built animal which was rarely mounted except by stable boys who rode it bareback to water or who exercised it around the paddock. . . . The early horse was not built for carrying a rider any distance, being little more than a pony. The wooden figure of a mare which is in New York is somewhat sway-backed, with a rather large head ending in a big muzzle, and probably with a very short mane, which in that example has been clipped off. . . . A pair of these little steeds could draw no more than two men at the most, and in mountainous Syria even a single man often had to get out and walk, carrying the chariot on his shoulder. . . . The animal itself and the vehicle which it drew played highly important parts in the unparalleled success of the invasion of Egypt by the Hyksos. The latter were probably of Nomadic origin, of whatever race and language stock they may have been. Their animals were probably small and, being weak-backed, were always driven from a chariot; for it is only the Syrian goddess 'Anat who is shown mounted as a rule.'⁴

This passage in a book written by a twentieth-century Western

¹ See König, *op. cit.*, p. 15.

² Professor G. G. Cameron comments: 'I agree with your observation that the rapidity and effectiveness of the Völkerwanderung of the eighth and seventh centuries B.C. were due to the riding horse. The Assyrian liver omens (which tell the truth, in contrast to the annals) make it clear that the search for the better riding horse was Esarhaddon's motive for sending parties of men up on to the Iranian plateau as far as Pateiskhoreis [see p. 616, above]. The whole subject is highlighted by the oft repeated Persian claim that the empire "possesses good horses and (i.e. as well as) good men".'

scholar, which is actually a description of an Egyptian work of art made on the morrow of the Eurasian Nomad Völkerwanderung of the eighteenth or seventeenth century B.C., might have been a paraphrase of either Herodotus's description, written in the fifth century B.C., of a horse still in use among the Sigynnai in the Austrian Alps, or Strabo's description, written or copied round about the beginning of the Christian Era, of a horse still in use among the Siginnoi in the Elburz or the Caucasus; and the correspondence is the more impressive considering that there is no indication in Winlock's book of his being acquainted with either of these two passages of Hellenic literature.

'Their horses', writes Herodotus in his account of the Sigynnai, 'are said to be shaggy all over, with a coat five fingers thick. They are small, with snub muzzles, and cannot carry a rider, but they fly like the wind when yoked to a chariot, and consequently the people of that country are charioteers.'¹

'The Siginnoi', writes Strabo in his account of these, 'have small shaggy ponies (*hipparia*) which cannot carry the weight of a rider, so they yoke them in four-in-hands.'²

Strabo's Siginnoi and Herodotus's Sigynnai were evidently the descendants of participants in the Eurasian Nomad Völkerwanderung of the eighteenth or seventeenth century B.C. who had strayed into the fastnesses of the Elburz or Caucasus and the Alps and had survived there as 'living museums' of the chariot-driving conquerors whose wheel-borne fleets had swept across South-West Asia into Egypt some twelve or thirteen hundred years before Herodotus's day and some sixteen or seventeen hundred years before Strabo's.³ It was left for the Spardiya, Paktyes, Cimmerians, Scyths, Kaspioi, and other hordes of the swarming 'Umman Manda' to surpass the feat of their forerunners the Maryanni and Mitanni by breeding horses that a fighting-man could ride; and, after this Sakan light cavalry had gone the way of the Hyksos chariotry, it was left for the Sarmatians to surpass the feat of their forerunners the Cimmerians and the Scyths by breeding 'the great horse' whose backbone could bear the weight, not only of a man, but of a man clad in mail cap-à-pie, in addition to the horse's own hardly less complete suit of armour⁴—a horse which was to carry to victory the Goths at Adrianople in A.D. 378 and the Normans at Hastings in A.D. 1066, besides playing his part, beyond the opposite shore of the Great Eurasian Steppe, in bringing a Sinic Civilization to the ground and rearing a Far Eastern Civilization to replace it. In the Achaemenian Age the cataphract is already in the arena. At Plataea in 479 B.C. he is represented by Masistius,⁵ and at Gaugamela in 331 B.C. by the Sakā

¹ Herodotus, Book V, chap. 9.

² Strabo: *Geographica*, Book XI, chap. xi, § 8 (C. 520).

³ Another surviving remnant of the chariot-driving Eurasian Nomad host that had erupted out of the Steppe in the eighteenth or seventeenth century B.C. is perhaps to be detected in the Heniochoi ('Chariot-drivers') who, in the post-Alexandrine Age of Hellenic history, were to be found in the fastness between the north-east shore of the Black Sea and the north-west end of the Caucasus Range (see Strabo: *Geographica*, Book II, chap. iii, § 31 (C. 129); Book XI, chap. ii, § 1 (C. 492) and §§ 12-14 (C. 495-6); Book XI, chap. v, § 6 (C. 506); Book XVII, chap. iii, § 24 (C. 839)).

⁵ See Herodotus, Book IX, chap. 22.

Haumavargā in the heavy brigade that contested the field with the Macedonian horse so stubbornly.¹ In 331 B.C., however, the cataphract's great days were still to come. The cavalry of the age were the Ummān Manda light horse who had opened the way for the establishment of the Achaemenian Empire by their wild ride from the heart of the Steppe to the Jumna and the Indus Delta and the Aegean and the Carpathians and beyond the Carpathians into the Hungarian Alföld.

¹ See the account, in Arrian: *Expediitio Alexandri*, Book III, chap. xiii, §§ 2-4, of the opening engagement between Darius's Bactrian and Sakan cavalry and Alexander's mercenary cavalry and Paeonians. In this engagement 'Alexander's troops suffered heavy casualties, not only because they were overborne by the Orientals' superiority in numbers, but because the Sakas and their horses had the advantage of being more efficiently protected by defensive armour'.

MOSCOW'S CHANGES OF FORTUNE AND
THEIR HISTORICAL CAUSES

BOTH the eclipse of Moscow in the early eighteenth century and her recovery of her pristine status of being the capital of All the Russias in the early twentieth century can be explained, at least in part, in terms of the relaxation and reapplication of an external pressure.

Though Moscow had begun her career as an outpost of Russian Orthodox Christendom against the primitive pagan tenants of the north-eastern forests,¹ she had made her political fortune from the fourteenth century onwards as the main bulwark of a remnant of Russian Orthodox Christendom against an aggressive Western Christendom which had advanced eastward, overrunning the White Russian and Ukrainian marches of Russia, till, by the middle of the fifteenth century, the eastern frontier of Poland-Lithuania had come to lie within a short march of Moscow's western gate. The situation thus established had persisted for more than a century and a half. It was not till after the Polish occupation of Moscow itself in A.D. 1610-12² that the tide turned and Muscovy began to liberate Russian Orthodox Christian territory that had been conquered by Poland-Lithuania at earlier dates. By the beginning of the eighteenth century, however, Poland-Lithuania had become so feeble that the pressure on Russia from that quarter had diminished to vanishing-point, and in consequence Moscow had lost the significance—previously attaching to her as the defender of Russia's march against the Western World—which had been one of the causes of Moscow's both gaining and keeping a position of primacy inside the Russian World itself. During the ninety-two years that elapsed between the removal of the capital of the Russian Empire from Moscow to Saint Petersburg and the completion of the eighteenth-century partition of Poland, the balance of power on Russia's western march tipped more and more heavily in Russia's favour until in A.D. 1795 Russia recovered the last of the Russian Orthodox Christian territories that had been conquered by Western Christian Powers since the fourteenth century, with the sole exception of Eastern Galicia. In this rather exceptional chapter in the history of Russia's politico-military relations with the West along this land-frontier, Moscow's role of serving as guardian of the gate was naturally at a discount,³ and it was probably no accident that this was also the age in which Moscow was at her nadir and Saint Petersburg at her zenith in the domestic history of the Russian body social.

However that may be, there can be no doubt that Moscow's recovery of prestige, which was the necessary prelude to her reattainment of her lost prerogative of serving as the political capital of All the Russias,

¹ See II. ii. 154.

² See II. ii. 157.

³ See II. ii. 158, n. 1.

began from the moment when the pressure of the Western World on Russia once again became formidable. When the Polish Western invaders' feat of occupying Moscow in A.D. 1610-12 was repeated by French Western invaders in A.D. 1812, Moscow once again played the *beau rôle* while Saint Petersburg was enjoying an inglorious security;¹ and thereafter the successive German invasions of Russia in A.D. 1915 and A.D. 1941 indicated to Russian minds that the renewal of Western aggression under Napoleon's leadership had been, not a meaningless curiosity of history, but an earnest of a danger against which any government of Russia would have, in future, to be perpetually on its guard. The Polish and French invaders who in turn had momentarily occupied Moscow, and the German invaders who had only just failed to repeat the exploit, had all made their way into Great Russia along 'the duck walk' of comparatively dry ground between the parallel upper courses of the Dniepr and the Baltic Dvina, and the attractiveness of this narrow passage for Western invaders re-established the strategic importance of Moscow, in view of her situation covering 'the duck walk's' eastern exit.

It will be seen that, at the time when the Bolsheviks retransferred the seat of government from Saint Petersburg to Moscow, the original capital of the Russian Empire offered the same double advantage that had drawn the capital of the Roman Empire away from Rome to the neighbourhood of the Bosphorus in the time of Diocletian and Constantine the Great. In the 'geopolitical' circumstances of the day, Moscow was not only more conveniently situated than Leningrad for serving as the administrative capital of the Soviet Union as a whole; it was at the same time a more convenient point of vantage for simultaneously keeping an eye on that frontier from beyond which the most formidable threat to the Soviet Union's security was now to be apprehended.

A reader who is interested in this 'geopolitical' question may perhaps think it worth while to compare this Annex with II. D (v), vol. ii, pp. 157-8, in which the same vicissitudes in the fortune of Moscow and Saint Petersburg have been rather differently interpreted. When writing that passage in A.D. 1931, the writer did not realize that Moscow had now again become a bulwark of Russia on a once more dangerous western land-frontier, besides continuing to possess the attraction, which she had never ceased to possess, of being the most convenient centre of administration for the interior. What had become obvious to the present writer in A.D. 1952 after a German invader had all but encircled Moscow in the war of A.D. 1939-45 had no doubt been manifest to Lenin and his companions twenty-five years earlier.

¹ See II. ii. 400.

VII. A (i) AND (ii), ANNEX

CHURCHES AS GHOSTS

A 'DIE-HARD' upholder of the thesis that the histories of churches are incidental to the histories of civilizations might still be unwilling to confess defeat, even if he found himself unable to refute our argument that the churches are neither cancers preying upon civilizations nor chrysalises serving them for the reproduction of their kind. He might still fall back on a third hypothesis. If the churches are neither chrysalises nor cancers, may they not be ghosts? In the main stream of this Study we have not checked our course in order to discuss a third possible alternative presentation of churches in terms of civilizations which is even less convincing than the other two; but this explanation of churches as being the ghosts of civilizations perhaps deserves brief consideration in an annex.

The most plausible piece of evidence that can be cited in support of this diagnosis is the last phase in the history of the Egyptiac Civilization. When, in the eleventh century B.C., 'the New Empire' petered out, the Pharaonic Crown was assumed by the Chief Priest of Amon-Re of Thebes;¹ and thereafter, when, in the tenth century, this ecclesiastical continuation of 'the New Empire' collapsed in its turn and the greater part of the Egyptiac World was 'peacefully penetrated' by Libyan barbarians, an uncontaminated remnant of the Egyptiac social heritage was still preserved in four temple-states under the rule of the priests of the local divinities: Amon-Re of Thebes, Ptah of Memphis, Re of Heliopolis, and Horus of Letopolis. These four ecclesiastical principalities were left inviolate by the barbarian squatters who occupied the rest of the Egyptiac Civilization's domain.² What was the source of the prestige that enabled Hrihor to make himself master of the Imperial Throne, and the four local corporations of priests, in the next chapter of the story, to take over the government of their respective cities? If these local ecclesiastical principalities were respected by the incoming barbarians, was that not because they were recognized as being legatees of the Egyptiac culture? And was not Hrihor's political standing due, more specifically, to his ecclesiastical status as Chief Priest of a once local god who had become the High God of an Egyptiac Pantheon because his city had become the capital of an Egyptiac universal state which had been both founded and refounded by local Theban princes?³ Would Hrihor have found himself in a position to step into Pharaoh's shoes⁴ if his ecclesiastical office had not carried with it, *ex officio*, the presidency of a Pan-Egyptiac 'established church' which had been organized by the Emperor Thothmes III some four hundred years before Hrihor's day?⁵

¹ See II. ii. 116, n. 1; IV. iv. 421 and 515-17; and p. 190, above.

² See IV. iv. 422; V. v. 269-70 and 352-3.

³ See pp. 213-15, above.

⁴ The possibility that Hrihor may have usurped the Chief Priest's throne as a step towards usurping Pharaoh's has been noticed on p. 190, n. 1, above.

⁵ See I. i. 145, n. 5; IV. iv. 421; and V. v. 530.

We may go on to observe that the local temple-states, in which the Egyptian culture was preserved, like a fly in amber, from the tenth century B.C. onwards for some fourteen hundred years,¹ had had their counterparts in the derelict domains of other broken-down civilizations. For example, the Hittite Civilization, which suffered a violent death soon after the turn of the thirteenth and twelfth centuries B.C., was still living an ecclesiastical life-in-death in Strabo's day,² some twelve hundred years later, in the twin temple-states which had crystallized round the shrines of the Goddess Ma in the Pontic Cappadocian city of Comana and in its South Cappadocian namesake.³ In the same sense the temple-state at Jerusalem, which was licensed by Cyrus the founder of the Achaemenian Empire and was extinguished by the Edomite usurper Herod the Great, was an ecclesiastical 'ghost' of a secular Syriac parochial state Judah that had been done to death by Nebuchadnezzar.

After the temple-state at Jerusalem, in its turn, had gone the way of the original Kingdom of Judah, Jewry still contrived to preserve its communal identity in diaspora thanks to a corporate religious life that survived the loss of its historic ecclesiastical citadel; and this Jewish achievement will remind us that a temple-state is only one variety of a social phenomenon which, in this Study, we have learnt to think of as a 'fossil'. If we now call to mind other examples of the general phenomenon that is exemplified in a post-Exilic Jewry, we shall observe that a majority of our 'fossils' had been preserved in an ecclesiastical sheath. The Tantric Mahayanian Buddhist fossil of an extinct Indic Civilization was, in fact, still embodied, at the time of writing, in a number of living temple-states: the ecclesiastical principality of the Dalai Lama in Tibet and its satellite temple-states in Mongolia.⁴ The fossil of an extinct Babylonian Civilization that survived in the Mesopotamian city of Harrân down to the time of the 'Abbasid Caliphate preserved its identity by remaining faithful, in a Christian and Muslim environment, to an ancestral pagan religion and astral philosophy.⁵ The Monophysite, Nestorian, and Zoroastrian fossils of an extinct Syriac Civilization managed, like Jewry, to retain their identity in diaspora by maintaining their corporate religious organization.

The existence of temple-states in particular, and 'fossils' in general, does suggest that there are such things as ecclesiastical 'ghosts' of defunct secular societies; and this impression will be reinforced if we

¹ The temple-state of Amon-Re at Thebes did not have so long a life as its three sisters in the Delta. It perished in the struggle for possession of the Egyptian World between Napatan, Assyrian, and Saïte competitors in the eighth and seventh centuries B.C. (see IV. iv. 422, n. 3).

² See Strabo: *Geographica*, Book XII, chap. ii, § 3 (C 535), for the South Cappadocian Comana; Book XII, chap. iii, §§ 32-36 (C 557-9), for the Pontic Comana; Book XII, chap. iii, § 31, for the shrine of Men Pharnacis at Cabeira.

³ These two Hittite ecclesiastical principalities were the most remarkable representatives of a group which also included, among others, those ruled by the priests of Cybele at Pessinus and by the priests of Mén at Pontic Cabeira and in the piece of Central Anatolian territory that was eventually converted into the domain of the Seleucid Greek city-state of Antioch-towards-Pisidia (see IV. iv. 312, n. 1).

⁴ The writer did not know whether, in the year A.D. 1952, these temple-states still survived in Outer Mongolia under a Communist régime.

⁵ See IV. iv. 101, n. 1; V. v. 125, n. 1; and IX. viii. 408, n. 5.

turn over the page of an historical atlas of Christendom; for this will show us at a glance that, while ecclesiastical geography is apt to reflect political geography, the political map that an ecclesiastical map reproduces is usually not the map of the political world of the day but a map which, on the political plane, has long since been obsolete. In another context¹ we have already observed that in the ecclesiastical map of a Medieval France the archbishoprics are 'ghosts' of the provinces of the Diocletianic Roman Empire, while the bishoprics are 'ghosts' of the Roman municipalities of Gallia Togata and the independent cantons of Gallia Comata as they had stood on the eve of Julius Caesar's conquests. In the ecclesiastical map of a Medieval Italy the archbishoprics commemorate the competition of Milan and Ravenna with Rome, between the third and the eighth century of the Christian Era, for the distinction of serving as a regional centre of Roman imperial administration, while the bishoprics are ghosts of the municipalities of the Italy of the Emperor Augustus. In the ecclesiastical map of a Medieval East Roman Empire the archbishoprics correspond, not to the army-corps districts (*themata*) which were the units of contemporary provincial organization,² but to the provinces of the Roman Empire in the Age of Justinian.

In this medieval ecclesiastical map of Eastern Orthodox Christendom, what is true of the boundaries of the archbishoprics is not true of the boundaries of the patriarchates; for, as we have noticed elsewhere,³ the lines of demarcation between these major units of medieval ecclesiastical organization do not correspond, as they might be expected to correspond, to those between the major units of political organization in the Roman Empire of either Constantine's or Justinian's day. In contrast to the politically anachronistic boundaries between the bishoprics, the boundaries between the patriarchates turn out to be politically up to date; and, when we look into the historical reason for this anomaly, we find that it was the result of action deliberately taken by the Medieval East Roman Government, which had enlarged the area of its own metropolitan Patriarchate of Constantinople, at the expense of the two neighbouring patriarchates of Antioch and Rome, to make the Patriarchate of Constantinople coincide in area with the Medieval East Roman Empire itself. This modification of traditional ecclesiastical frontiers by political fiat was a characteristic East Roman act of state; for we have seen in another context⁴ that the assertion of the supremacy of the State over the Church was a constant aim of East Roman imperial policy; and, when the East Roman Imperial Government found itself unable to control the Patriarchs of Antioch and Rome because their sees were situated in territories where the East Roman Government's writ did not run, it made the best of what was a bad job from its standpoint by high-handedly annexing to its own tame Patriarchate of Constantinople, whose incumbent was under the Emperor's thumb, those outlying fringes of the ecclesiastical dominions of the Patriarch of Antioch and the Pope of Rome—Western Cilicia

¹ On p. 192, above.

³ On p. 191, above.

² See II. ii. 79-81 and 153-4; and IV. iv. 332.

⁴ In IV. iv. 320-408 and 592-623.

in the one case and Greece, Sicily, and the 'toe' and 'heel' of Italy in the other case—which happened to lie within the East Roman Empire's political frontiers.

This alteration of the boundaries of the patriarchates to serve the East Roman Government's purposes can be seen, on a longer historical perspective, to have been a passing incident in a rivalry between these ecclesiastical Great Powers which was an old story by the time when the East Roman Empire was conjured up in the eighth century of the Christian Era, by the genius of Leo Syrus, and which did not cease when the East Roman Empire perished, at the turn of the twelfth and thirteenth centuries, at the hands of Western Christian 'crusaders'. In this light we can see that the patriarchates too, like the archbishoprics and the bishoprics, of Christendom are ecclesiastical 'ghosts' of defunct bodies politic. Whereas the bishoprics are ghosts of city-states and cantons, and the archbishoprics are ghosts of Diocletianic Roman provinces, the patriarchates are ghosts of political Great Powers that had contended with one another in the international arena of the Hellenic World in the third and second centuries B.C. before the balance of power had been overthrown by the triumph of the Roman Commonwealth over all its competitors. On this view, the Papacy is the ghost of the Roman state; the Patriarchate of Alexandria is the ghost of a Ptolemaic successor-state of the Achaemenian Empire; the Patriarchate of Antioch is the ghost of a Seleucid successor-state of the same *ci-devant* oecumenical power; the Patriarchate of Constantinople is the ghost of the ephemeral appanage of the Macedonian war-lord Lysimachus, whose realm had once momentarily straddled the Straits and extended from Rhodope to Taurus before it was extinguished in 281 B.C. in the final round of the conflict for the division of the spoils of Darius between the successors of Alexander the Great.

This latter-day re-emergence, in an ecclesiastical guise, of an abortive political successor-state of the Achaemenian Empire which had been snuffed out more than six hundred years before the foundation of Constantinople is a striking exemplification of the thesis that churches are ghosts of defunct secular polities and societies. On the morrow of the Battle of Corupedium a victorious Seleucus Nicator and Ptolemy Lagus would have been astonished to learn that their defeated and slain rival Lysimachus was one day to take the field against them again in a ghostly warfare between the Patriarchates of Antioch, Alexandria, and Constantinople.¹ The Roman soldiers and statesmen who imposed

¹ Constantinople's success in forcing an entry into the ring of patriarchal sees was a remarkable feat. The patriarchal status of Rome, Alexandria, and Antioch had been established *de facto* already before the parvenue New Rome on the Bosphorus was founded, and all three sees were expressly confirmed in their customary rights, *iure canonico*, by Canon 6 of the Oecumenical Council of Nicaea (*sedebat* A.D. 325). The Oecumenical Council of Constantinople (*sedebat* A.D. 381) declared (Canon 2) that there were five patriarchates in the East. This was the logical 'layout' for an ecclesiastical map of the Roman Empire that was to follow the pattern of the political map (see pp. 191-2, above); for the patriarchal sees of Alexandria and Antioch corresponded respectively to the civil 'dioceses' of Egypt and the Orient, and this gave each of the three other eastern 'dioceses'—Pontus, Asiana, and Thrace—a presumptive title to be the locus of a separate patriarchal see. As it turned out, Constantinople contrived to bring the areas of all these three civil 'dioceses' under her own patriarchal jurisdiction.

Rome's yoke upon the necks of the Seleucids and the Ptolemies would have been no less surprised to see these subjugated Macedonian monarchies come back to life to challenge Rome's supremacy in an ecclesiastical arena. Yet the Eastern Orthodox patriarchates' rejection of the Roman See's claim to supremacy was, *sub specie historiae*, the reopening of an issue that had been closed on the political plane by Scipio's victory at Magnesia and Octavian's victory at Actium.

Does the evidence so far presented suffice to obtain judgement in favour of the advocates of 'the ghost theory' of the relation between churches and civilizations? The Roman instance is the classic example, and it would seem reasonable to take this as our test case. Is not Hildebrand's attempt to build a *Respublica Christiana* on the foundation of the Roman See a true parallel to Hrihor's attempt to sustain a tottering 'New Empire' of Egypt by placing the Pharaonic Crown on the head of the Chief Priest of Amon-Re of Thebes? And is not the subsequent temporal power of the Popes, and of the other prince-bishops in Western Christendom, in their local ecclesiastical principalities, a true parallel to the temporal power of the temple-states of Thebes, Memphis, Heliopolis, and Letopolis after the failure of Hrihor's more ambitious enterprise?¹

This theory is applied to the Papacy by Thomas Hobbes of Malmesbury in a celebrated passage:

'If a man consider the originall of this great Ecclesiasticall Dominion, he will easily perceive that the *Papacy* is no other than the *Ghost* of the deceased *Romane Empire*, sitting crowned upon the grave thereof; for so did the Papacy start up on a Sudden out of the Ruines of that Heathen Power.'²

The voices of 'the barefooted fryars . . . singing Vespers in the Temple of Jupiter'³ must indeed have sounded like the ghostly echo of a pagan Roman liturgy when they floated into Gibbon's ears on the evening of the 15th October, 1764,⁴ though, when he harvested the inspiration that had germinated in his mind on that memorable occasion, Gibbon came to adopt, not 'the ghost theory', but 'the cancer theory', of the relation between the Roman Church and the Roman Empire.⁵ 'The ghost-theory', however, was implicit in a phrase of Bossuet's (*vivebat* A.D. 1627-1704) which Gibbon appears to have been consciously echoing⁶ when he summed up *The History of the Decline and Fall of the Roman Empire* by saying that he had 'described the triumph of Barbarism and Religion'.⁷ Bossuet had said: 'Rome, devenue la proie des barbares, a conservé par la religion son ancienne majesté';⁸ and

¹ This parallel has been suggested already in IV. iv. 471, n. 2.

² Hobbes, Th.: *Leviathan*, Part IV, chap. 47.

³ *The Autobiographies of Edward Gibbon*, edited by Murray, J. (London 1896, Murray), p. 302, quoted in IV. iv. 59-60.

⁴ See the passage quoted from Pickman on pp. 533, above. ⁵ See XIII. x. 105-107.

⁶ The echo of Bossuet's phrase in Gibbon's has been pointed out by Meissner, P., in *Grundformen der Englischen Geistesgeschichte* (Stuttgart and Berlin 1941, Kohlhammer), p. 8.

⁷ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. lxxi, already quoted in I. i. 42 and IV. iv. 58.

⁸ Bossuet, J.-B.: *Discours sur l'Histoire Universelle*, Book III, chap. 1.

Gibbon, in another passage of his work,¹ explicitly made Bossuet's point in his own observation that, 'after the loss of her legions and provinces, the genius and fortune of the popes again restored the supremacy of Rome'. It will be seen that Bossuet's dictum agrees with Hobbes' as a statement of Christian Rome's relation to her pagan predecessor, though these two seventeenth-century Western philosophers are poles apart in the inference that they draw from an identical hypothesis.² What to Hobbes' mind is a damning exposure is to Bossuet's mind a crowning glory; and, in taking this auspicious interpretation for granted, the seventeenth-century bishop is taking his cue from a fifth-century Pope. Preaching in Rome on the festival of the Apostles Peter and Paul, Pope Leo the Great (*pontificali munere fungebatur* A.D. 440-61) called his heroes 'the true founders of the city'.

'It is they who have raised thee to thy present pinnacle of glory, in order that—as a holy family, a chosen people, a priestly as well as a royal city that has become the capital of the World in virtue of being Blessed Peter's Holy See—thou mightest reign over a wider realm in the strength of our divine religion than in the exercise of an earthly dominion. Successive victories have added to thy territories till thou hast extended thy sovereignty far and wide over land and sea; yet the empire that has been made subject to thee by thy prowess in war is not so far flung as the domain that has been brought into thy fold by a Christian Peace.'³

¹ In chap. xlix.

² Mr. Martin Wight notes: 'The ghost theory had a special appeal for English common lawyers, who after the Reformation were apt to regard Canon Law as a malignant form of haunting. The point is made by Charles II's lord chief justice Sir Matthew Hale (*vivebat* A.D. 1609-76), in *The History of the Common Law of England*, chap. v (2nd ed. (London 1739, Walthoe), pp. 71-72):

"Rome, as well Ancient as Modern, pretended a kind of universal Power and Interest; the former by their Victories, which were large, and extended even to Britain itself; and the later upon the Pretence of being Universal Bishop or Vicar-General in all Matters Ecclesiastical; so that, upon Pretence of the former, the Civil Law, and, upon Pretence of the later, the Canon Law was introduc'd, or pretended to some kind of Right, in the Territories of some absolute Princes, and among others here in England."

Bryce makes the same point, with more detachment, in *Studies in History and Jurisprudence* (Oxford 1901, Clarendon Press, 2 vols.), vol. ii, pp. 245-6. Cp. Heine, Heinrich: *Zur Geschichte der Religion und Philosophie in Deutschland*: "Rom wollte herrschen; 'als seine Legionen gefallen, schickte es Dogmen in die Provinzen'" (*Religion and Philosophy in Germany*, translated by John Snodgrass (London 1882, Trübner), p. 22: "Rome always desired to rule; when her legions fell she sent dogmas into the provinces").

³ 'Isti sunt qui te ad hanc gloriam provexerunt, ut—gens sancta, populus electus, civitas sacerdotalis et regia—per sacram Beati Petri sedem caput Orbis effecta, latius praesideres religione divinā quam dominatione terrenā. Quamvis enim multis aucta victoriis ius imperii terrā marique protuleris, minus tamen est quod tibi bellicus labor subdidit quam quod pax Christiana subiecit.'—Pope Leo the Great: *Sermo lxxxii*, in *Natali Apostolorum Petri et Pauli* (Migne, P.-J.: *Patrologia Latina*, vol. liv (Paris 1846, Migne), cols. 422-3 (quoted in Vogt, J.: *Orbis Romanus* (Tübingen 1929, Mohr), pp. 31-32). In the present Study, on p. 72, above, we have already quoted another passage of the same sermon in which Pope Leo points out the services rendered, not by Christianity to Rome, but by the Roman Empire to the Christian Church. This pair of complementary ideas is anticipated in a passage of a memorial, addressed to the Emperor Marcus Aurelius (*imperabat* A.D. 161-80) by his Christian contemporary and subject, Bishop Melito of Sardis, which is quoted by Eusebius (*Historia Ecclesiastica*, Book IV, chap. xxvi, §§ 7-11). Melito points out that the Church and the Empire are coeval (the propagation of Christianity through the Empire having started in the reign of the founder of the Empire, Augustus); he also suggests that the Empire, even during the first two centuries of its, and the Church's, history, has gained more from the spiritual support of the Church than the Church has gained from the mundane convenience of the *Pax Romana* (see p. 72, n. 1, above).

In this vision of Rome's destiny as it appears to Leo's eagle eye, the Christian 'ghost' of Rome is more robust than its pagan 'original'. Which of these two appearances is the wraith, and which is the creature of flesh and blood? Is Hobbes right in maintaining that Romulus and Remus have made the fortunes of Peter and Paul? Or is Leo right in maintaining that Peter and Paul have saved the situation for Romulus and Remus? This issue was debated in public between a successor of Leo and a servitor of Leviathan during an episode in a conflict between the Papacy and the Kingdom of Italy which had been formally settled by the signature of three agreements at the Papal Palace of the Lateran on the 11th February, 1929,¹ but which smouldered on, and kept on flaring up, because it was an incident in a still undecided battle, on a wider front, between the worship of God and the worship of Man's corporate self.

In a speech delivered in the Chamber of Deputies at Rome on the 14th May, 1939,² Benito Mussolini reopened the issue by suggesting that Christianity would never have become a universal religion if the grandeur—and decadence—of Imperial Rome had not given her her opportunity.

'Italy has the singular privilege, of which we ought to be proud, of being the one European nation that is the seat of a universal religion. That religion was born in Palestine, but Rome was the place where it became Catholic. Had it stayed in Palestine, most probably it would have been one of those innumerable sects that flourished in that derelict environment—sects like the Essenes and the Therapeutae, for instance—and most probably, too, it would have flickered out without leaving a trace of its influence. . . .

'It was in Rome that Christianity found its favourable environment. It found it, in the first place, in the lassitude of the governing classes and the consular families, who, in the time of Augustus, had become effete, run to fat and gone sterile; it found it, above all, in the swarming ant-heap of Levantine humanity which was the plague of Rome's social sub-soil—a public for whom a speech like the Sermon on the Mount opened up horizons of revolt and revenge.'³

This offensively patronizing and provocatively controversial parenthesis in a militant political pronouncement drew fire from Pope Pius XI in an address which he gave next day to a deputation from the

¹ For this settlement and its aftermath, see Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1929* (London 1930, Milford), pp. 422–78.

² The text will be found in Mussolini, B.: *Scritti e Discorsi*, vol. vii (Milan 1934, Hoepli), pp. 34–35.

³ 'L'Italia ha il privilegio singolare, di cui dobbiamo andare orgogliosi, di essere l'unica nazione europea che è sede di una religione universale. Questa religione è nata nella Palestina, ma è diventata cattolica a Roma. Se fosse rimasta nella Palestina, molto probabilmente sarebbe stata una delle tante sette che fiorivano in quell'ambiente arroventate, come ad esempio quelle degli Esseni e dei Terapeuti, e molto probabilmente si sarebbe spenta, senza lasciare traccia di sé. . . .

'Il Cristianesimo trova il suo ambiente favorevole in Roma. Lo trova, prima di tutto, nella lassitudine delle classi dirigenti e delle famiglie consolari, che ai tempi di Augusto erano diventate stracche, grasse e sterili, e lo trova, sopra tutto, nel brulicante formicaio dell'umanità levantina che affliggeva il sottosuolo sociale di Roma, e per la quale un discorso come quello della Montagna apriva gli orizzonti della rivolta e della rivendicazione.'

Jesuit College of Mondragone; and, when Mussolini—taken aback by the reception of his ill-considered excursion into the interpretation of history—sought, in the Senate on the 25th May, to improve the defences of an exposed position without overtly surrendering any ground, his elaboration of his thesis led him floundering deeper into the mire and gave his formidable adversary an opening for striking a winning blow. In a letter of the 30th May, 1929, addressed to Cardinal Gasparri, the Pope had the last word.

'Least of all did We expect to be treated to heretical pronouncements on the very essence of Christianity and Catholicism. There has been an attempt to emend them, but this attempt has not been altogether successful, to Our mind. . . . The divine mission to all the nations preceded the calling of Saint Paul; and this was also preceded by the mission of Saint Peter to the Gentiles. Thus the universality of the Church—both by right and in fact—is already there at the very outset of the Church's history and of the Apostles' preaching. Through the work of the Apostles and of their apostolic fellow-labourers, this universality very soon surpassed the limits of the Roman Empire—which, as everybody knows, was very far indeed from being coextensive with the whole World [as] known [to the Ancients]. If all that was intended was a reference to the facility for the diffusion and organisation of the Church that was providentially provided in the organisation of the Roman Empire, all that was necessary was a reference to Dante and Leo the Great—two great Italians who, in a few magnificent words, have stated, in lapidary form, the substance of what has become a commonplace in second-hand restatements by innumerable other voices.'

In this encounter, Pope Pius discomfited Mussolini as signally as Pope Leo had discomfited Attila; and the invocation of the Apostles on Christian Rome's behalf was indeed an argument to which there was no retort. Thomas Hobbes himself, shrewd in argument though he was, had simple-mindedly let the cat out of the bag in a sentence immediately preceding the passage of his *Leviathan* that we have quoted. In defining the period in which the Papists' 'whole Hierarchy or Kingdome of Darknesse may be compared not unfitly to the *Kingdome of Fairies*' by dating it 'from the time that the Bishop of Rome had gotten to be acknowledged for Bishop Universall by pretence of Succession to Saint Peter',² Hobbes has made, in advance, the admission that the Papacy is what it is in virtue of being the heir of the Apostolic Christian Church, and not in virtue of being the ghost of the pagan Roman Empire.

These findings may confirm us in the conclusion, reached in an

¹ 'Men che tutto Ci aspettavamo espressioni ereticali sulla essenza stessa del Cristianesimo e del Cattolicesimo. Si è cercato di rimediare: non Ci sembra con pieno successo. . . . Il mandato divino alle genti universe è anteriore alla chiamata di San Paolo; anteriore a questa il mandato di San Pietro ai gentili; l'universalità si riscontra già di diritto e di fatto agli inizi primi della Chiesa e della predicazione apostolica; questa per opera degli apostoli e degli uomini apostolici ben presto più vasta dell' Impero Romano, che, come è noto, non era di gran lunga tutto il mondo conosciuto; se si voleva soltanto ricordare l'utilità providenzialmente preparata alla diffusione e organizzazione della Chiesa nella organizzazione dell' impero romano, bastava ricordare Dante e Leone Magno, due grandi Italiani, che in poche e magnifiche parole dissero e scolpirono la sostanza di quanto poi innumeri altri ridissero.'

² Hobbes, op. cit., loc. cit.

earlier context,¹ that 'the analogy between Hildebrand's Roman hierocracy and Hrihor's Theban hierocracy breaks down'; and, if our Roman case in point is a fair test case, as we have taken it to be, we may infer that the higher religions cannot be accounted for as being the ghosts of civilizations any better than they can be explained as being their cancers or their chrysalises.

¹ In IV. iv. 517.

VII. A (iii) (a), ANNEX I

SPIRITUAL ACHIEVEMENT AND MATERIAL ACHIEVEMENT: ARE THEY ANTITHETICAL OR INTERDEPENDENT?

IN previous passages¹ we have suggested that the circumstances favourable to spiritual and to secular progress are not only different but are antithetical. This is one of the themes of the Parable of the Sower: 'Some fell among thorns, and the thorns grew up and choked it, and it yielded no fruit';² but we arrived at our conclusion, not intuitively, but empirically, as a result of tracing backwards in time a process of progressive spiritual enlightenment of which Christianity was the latest stage and, in Christian belief, the highest so far reached. We found that each of those preceding stages of spiritual advance had taken place in social circumstances which, like those which saw the birth of Christianity, were marked by a failure of mundane endeavours and by the suffering which such failure entails. When we turn from Christianity to consider the other three living higher religions, we find their histories likewise conforming to our apparent 'law' that spiritual achievement and material achievement are antithetical.

Christianity was born of a disintegrating Hellenic Civilization's experience of suffering at the climax of its Time of Troubles, and it came of age in the social interregnum following the Hellenic Civilization's final dissolution at the break-up of the Roman Empire. The histories of the Mahāyāna, Hinduism, and Islam reveal the same pattern of relation between spiritual and secular life. The Mahāyāna and Hinduism³ both emerged during a period, running from the second century B.C. to the fourth century of the Christian Era, when the Indic World was suffering under an intrusion of the Hellenic Civilization in the form of military invasions by Bactrian Greek war-lords and their Kushan successors. Thereafter, the Mahāyāna captivated Far Eastern hearts during a social interregnum that followed the dissolution of the Sinic Civilization upon the break-up of the Empire of the Posterior Han at the turn of the second and third centuries of the Christian Era. As for Islam, it achieved its amazing metamorphosis from being the heresy of a barbarian prophet into being a higher religion in its own right under the Arab Caliphate, which was the second and last phase of a Syriac universal state; and it rose to the occasion in an age when the break-up of the Caliphate was announcing the dissolution of the Syriac Civilization. In the history of Islam at this stage the rise of Christian monasticism and Christian mysticism had its parallel in the dervish movement and in Islamic

¹ On pp. 425 and 551, above. See also pp. 759-68, below.

² Mark iv. 7. Cp. Matt. xiii. 7 and Luke viii. 7.

³ Hinduism, that is, in the sense—to which the use of the term is confined in this Study—of the devotional religion which grew up, beneath the crust of the ritual religion of the Vedas, contemporaneously with the growth of devotional Mahayanian Buddhism beneath the crust of an ascetic Hinayanian Buddhism.

mysticism; and in this case, as in that, an outburst of spiritual life at a moment of mundane catastrophe was the secret of the triumphant religion's success in converting both the human sheep left shepherdless by the disappearance of a secular universal state and the wolf-like invading barbarians.

The same 'law' seems to be exemplified in the history of Zoroastrianism. In another context¹ we have observed that this higher religion forfeited its prospect of becoming a universal church when it was conscripted to serve as the ecclesiastical instrument of a Sasanian State dedicated to the political mission of expelling an intrusive Hellenism from the Syriac World. In the light of this spiritual penalty which Zoroastrianism incurred as the price of obtaining the political patronage of an Imperial Power in the third century of the Christian Era, it is significant that her previous loss of the patronage of an Imperial Power, through the overthrow of the Achaemenian Empire by Alexander the Great in the fourth century B.C., had been followed by a marked increase of intensity in the radiation of her spiritual influence.

'The end of the Persian period by no means saw the end of Parsee [i.e. Zoroastrian] influence on Jewish eschatology. Indeed, on the contrary, from this time onwards the influence becomes much stronger and more forceful and apparently more conscious, in contrast to the previous chapter of history, in which the adoption of Parsee ideas [by Judaism] was generally a more unconscious process. It is a peculiar phenomenon, of which there are many examples, that states and peoples do not exert their cultural and spiritual influence effectively until after their own political collapse. The culture of Ancient Greece was not transmitted to the Ancient World (it would be substantially true to say) until after the independence of the Greek city-states had been decisively abolished by Philip of Macedon; and the culture of Rome was not acquired, in the true sense, by the Germans before Rome's world empire had collapsed under the blows of the Teutons. There seems to be something like a law of Nature that peoples cannot sow, from a full hand, the golden seed of their spiritual treasures until they have renounced, or been compelled to renounce, earthly goods. This is certainly true of the religious ideas of Parseeism, and indeed of Iranian religion in general. These ideas radiate, with an unprecedented penetrative power, all over the domain of an expiring Ancient World when, but only when, the Persian Monarchy has collapsed.'²

It will be noticed that the student of religious history who is the author of the passage just quoted draws attention to our apparent 'law' of antithesis governing the conditions that make respectively for spiritual and for material achievement, but that, in the examples of its working which he cites, he does not confine himself to the field of Religion, but compares the case of Zoroastrianism with secular cultural phenomena which may be classified likewise as being 'spiritual' though they do not fall within the religious sphere of spiritual life. This raises the question whether our 'law', if it is a law for Religion, is likewise a law for spiritual life in a wider sense, in which the term 'spiritual' would cover aesthetic

¹ In V. v. 659-61.

² Gall, A. von: *Βασιλεία τοῦ Θεοῦ* (Heidelberg 1926, Winter), pp. 263-4.

and other non-religious cultural experiences and activities. Our 'law' has in fact been propounded, with this wider application, by an exiled Russian Orthodox Christian philosopher-prophet, Nicolas Berdyaev, in pursuance of an idea originally suggested by the German philosopher Oswald Spengler's sharply drawn antithesis between the connotations of the two German words *Kultur* and *Zivilisation*.

'Culture has always proved Life's greatest failure. An antithesis would seem to divide culture from the "life" that Civilisation attempts to realise. When a mighty German state is finally established, Capitalism and Socialism accompany it; and its main efforts are directed to assert its will to world power and organisation. But Goethe, the great idealists and romantics, great philosophy and art, will be missing from this mighty Imperialist and Socialist Germany. They will have been supplanted by technique, which has its repercussions even upon philosophical thought (in the gnosiological currents). Conquest is the method now applied in all spheres at the expense of the integral-intuitive apprehension of Being. The mighty civilisation of the British Empire holds no place for either Shakspeare or Byron, just as Dante and Michelangelo are inconceivable in [the] Modern Italy which erected the ponderous monument to Victor Emmanuel and established Fascism. And herein lies the tragedy of both Culture and Civilisation.'¹

Does a 'law' which has thus suggested itself independently to the minds of divers students of history fit the facts of non-religious spiritual life as unequivocally as it appears to fit the facts of religious experience? In the field of Religion we have noticed a number of signal testimonies to this law's validity without so far having stumbled upon any conflicting evidence. Is this equally true in the field of secular culture? If we extend our empirical survey into this other province of spiritual life, we shall find here that the examples of the working of the law are also striking, but that they are contradicted, in this province, by some no less signal breaches of it.

One of the classic examples of the working of our 'law' in the secular cultural field is cited by Berdyaev in the passage just quoted. In the history of the Modern Western secular culture in Germany it is notorious that the great age of German music, literature, and art falls within the period of political and economic adversity that began for Germany with the Thirty Years War (*gerebatur* A.D. 1618-48) and that ended for her with the foundation of the Second Reich in A.D. 1871. And this classic German instance is not a solitary one. 'The golden day' in which a wave of artistic creativity, set in motion by a Medieval Italian Renaissance, touched New England, in her turn,² after having fructified Germany, was extinguished by the political triumph of winning the Civil War and by the economic triumph of winning the West.

'The law of inverse operation' is likewise illustrated by the history of Persian literature. Just as the religious tendril of the Iranian genius flowered after the fall of the Iranian Empire of the Achaemenidae and withered after the rise of the Iranian Empire of the Sasanidae, so its aesthetic potentiality in the medium of Poetry did not reveal itself until

¹ Berdyaev, N.: *The Meaning of History*, English translation (London 1936, Bles), p. 212.

² See III. iii. 137.

after the fall of the Sasanian Empire had opened an Islamic chapter of Iranian history; and, even then, it had to wait until after the Persian genius had been decisively expelled from the arena of political life. The Islamic Persian literature did not come to flower during an age when the Persians, after their momentary military and political overthrow at the hands of the Primitive Muslim Arab conquerors, had come back into political power in the Syriac World, first as henchmen and ministers of the 'Abbasid Caliphs¹ and then as founders and rulers of successor-states of a crumbling 'Abbasid Empire. The Islamic Persian literature—in which the Persian language served as the vehicle for poetry such as had never before been begotten by the Persian artistic genius—came to flower at a moment when the Persian successors of the 'Abbasids were being supplanted by barbarian Turkish war-lords; the patron of Firdawsī was the Turk Mahmūd of Ghaznah; and, under Turkish and Mongol barbarian patronage, Persian literature continued to flourish so long as the Persians remained fast bound in the misery and iron² of political adversity. But, when, nine hundred years after the fall of the Sasanian Empire and five hundred years after the fall of the Samanid march-state in Transoxania,³ a Turkish-speaking dynasty paradoxically re-established a powerful and militant Persian national state, the golden chain of Persian poets broke off short as abruptly as the chain of German composers of music when, two hundred years after Germany's political and economic catastrophe in the Thirty Years War, a materially puissant Prussia-Germany was conjured into existence by Bismarck.⁴

The law of inverse operation can also be seen at work in the aesthetic field in the province of Visual Art, as well as in the provinces of Music and Literature. In another context⁵ we have noticed that, in a latter-day museum at Sparta, the specimens of an original, distinctive, and promising 'pre-Lycurgeoan' Lacedaemonian art are sundered from the specimens of a commonplace 'post-Lycurgeoan' art by a gap corresponding chronologically to the period during which Lacedaemon was a formidable political and military power in the Hellenic World in virtue of her devotion to a 'Lycurgeoan' *agôgê* which deliberately and cold-bloodedly concentrated on producing military efficiency and prowess at the cost of sacrificing every other aim in life. We have also noticed, in the same connexion, that the fifth, fourth, and third centuries B.C., during which the 'Lycurgeoan' régime held Sparta in its grip and inhibited her from indulging her previously manifest artistic genius, were the very centuries in which, in other Hellenic city-states, the visual arts were at their apogee.

This contrast between the artistic promise of 'pre-Lycurgeoan' Sparta and the conspicuousness of Art by its absence in the Sparta of the 'Lycurgeoan' Age has an historical parallel in the contrast between the masterly perceptiveness with which an Upper Palaeolithic Man depicted on the walls of his cave-dwellings the animals that were his game, and

¹ See pp. 148-51, above.

² Ps. cvii. 10.

³ See II. ii. 142.

⁴ The apparent inability of the Persian genius to express itself simultaneously in poetry and in politics has been noticed already in I. i. 360, n. 1, and II. ii. 77, n. 1. Compare I. i. 363, n. 3, and the passage quoted *ibid.*, pp. 393-4, from Mirzā Muḥammad Khan of Qazvin.

⁵ In III. iii. 66-67.

the unimaginativeness of the perfunctory decorations scratched or painted on the pottery of this magnificent primitive artist's Neolithic successor, who not only forged ahead of his aesthetically superior predecessor in the technique of fashioning stones into tools, but also demonstrated his own all-round superiority in economic capability by capping his invention of earthenware with the discovery of agriculture—a revolution in the material conditions of human life which, at the time of writing, still remained unsurpassed by any of the material achievements of any of the civilizations. If the dumb archaeological record that, midway through the twentieth century of the Christian Era, was the only extant evidence for the transition from the Upper Palaeolithic to the Neolithic way of life were ever to be illuminated by the dawning glimmer of an historical twilight that had revealed something of the inner history of the transition from a 'pre-Lycurgeoan' to a 'Lycurgeoan' Sparta, would it become apparent in the earlier, as in the later, tragedy that the artist's genius had been stifled by a will to power?

These parallels, in the spiritual provinces of Visual Art, Music, and Literature, to our examples of the working of 'the law of inverse operation' in the field of Religion are impressive as far as they go; but an unprejudiced survey reveals that, in the non-religious field of spiritual life, such evidences of the validity of our 'law' are counterbalanced by instances of breaches of it.

The case of Sparta, for example, is offset by the case of Athens; for the Periclean Athens who made herself 'the education of Hellas'¹ in the fifth century B.C. did not have to purchase her artistic and intellectual pre-eminence in the Hellenic World of that age at the price of renouncing the material power which an artistically barren contemporary Sparta was cultivating at the cost of everything else. On the contrary, at the very time when the Athenians were creating their exquisite works of art and literature, they were also building up their material power—and this on a basis far broader than any that the Spartans had ever dreamed of—to a pitch at which Athens, single-handed, proved almost strong enough to impose her dominion upon all the other city-states of Hellas. On this practical, power-building side of their multifarious activity in 'the Classical Age' the Athenians had begun by carrying through the economic revolution of abandoning subsistence-farming in favour of cultivating specialized crops, and manufacturing specialized industrial wares, for export in exchange for imports of foodstuffs for their own consumption at home;² in order to expedite this profitable new foreign commerce they had built up a merchant marine; and, on the twofold foundation of their newly acquired wealth and maritime experience, they had founded a navy which, as a weapon of war, outclassed the Spartan phalanx in subtlety as notably as in range. The potency of the Athenian Navy in the fifth century B.C. is expounded as follows by an anonymous Athenian student of public affairs whose observation of the Athenian democracy of his day was as keen as his dislike of it:

'[The] accidents [of geography] have played into the hands of Athenian

¹ A phrase attributed to Pericles himself by Thucydides, Book II, chap. 41.

² See I. i. 24-25; II. ii. 36-42; and III. iii. 122.

sea-power. The subjects of a land-power can club together a number of small communities and then go into action [against the paramount power] with concentrated forces; the subjects of a sea-power, in so far as they are islanders, are not in a position to bring their communities together in a physical union; they are insulated from one another by salt water; the paramount power rules the waves; and, even if the islanders could manage to slip through the blockade and concentrate their forces on a single island, they would [simply] die of hunger. As for Athens' subject communities on the mainland, the big ones are kept in subjection by intimidation and the small ones really by a [latent] economic sanction, since there is no community [in the world] that can do without imports and exports, and these will be denied to any community that does not show itself amenable to the rulers of the sea. And then the rulers of the sea can [count on being able to] do something that the rulers of land empires can do [only] occasionally: they can devastate the territory of their superiors in military strength. They can coast along an enemy shoreline where the enemy is either not on the spot at all, or anyway not in strength, and then, on the approach of [substantial] enemy forces, they can retire on board ship and stand out into the offing—tactics which condemn the enemy's relieving land-force (ὁ πεζὴ παραβοηθῶν) to have the worst of it. Then the rulers of the sea can make a naval expedition to any distance you like from their home base, while a land-power's range of action from its home base is limited to a few days' journey (marching overland being a slow business, and the ration-carrying capacity of a land-force being limited to not more than a few days' supply). Moreover, a land-force must either have friendly country to traverse or must fight its way through, whereas a naval force [is master of the initiative]: where it finds itself in superior strength it can disembark a landing-party; in the contrary event it is under no compulsion to try a landing at that particular point; it can [just] go coasting along till it reaches either friendly country or an enemy in inferior strength.¹

The versatility of the Athenians of the Periclean Age in simultaneously cultivating diverse capacities of human nature is eulogized, as a distinctive quality which is the secret of their greatness, in the Thucydidean version of a famous Periclean speech:

'We cultivate the Arts without extravagance and the Intellect without effeminacy. . . . Our politicians do not neglect their private affairs, and the rest of us devote ourselves to business without losing touch with politics. We are unique in regarding men who take no part in politics as being not merely unambitious but unprofitable; and we are all sound judges, if not creative statesmen, in public affairs. . . . In short, I maintain that the Commonwealth of Athens is the School of Hellas and that the individual Athenian will never meet his equal for gallantry, self-reliance, adaptability, versatility, and distinction, in whatever situation he may find himself. The proof that this is no empty boast, but is sober reality, is afforded by the power of our country, which is the fruit of our national character.'²

This simultaneous pre-eminence in artistic and material prowess, which is characteristic of Periclean Athens—though not of Sparta or

¹ Auctor Atheniensis Anonymus: *Institutions of Athens* (edited by Kalinka, E.: Berlin and Leipzig 1913, Teubner), chap. ii, §§ 2-5.

² Thucydides, Book II, chap. xl, §§ 1-2, and chap. xli, §§ 1-2.

Persia or Germany in any age—had had parallels in a Modern Western World in both seventeenth-century Holland and seventeenth-century France. The apogee of Dutch painting and Dutch scholarship had been contemporaneous with the apogee of Dutch commerce and Dutch naval, military, and political power; and in the twentieth century of the Christian Era France looked back to the reign of Louis Quatorze as 'le Grand Siècle' because in that age she had performed the twin feats of only just failing to impose her dominion upon all the other countries of the West and completely succeeding in making herself 'the education of Europe' thanks to the simultaneous brilliance of her achievements in the Arts. Thereafter, when Great Britain was harvesting the lion's share of the political and economic fruits of Holland's pyrrhic victory over Louis XIV's France, the consequent expansion of British commercial and naval power was accompanied in the realm of Literature by the achievement of a minor 'Augustan Age'; and the classic prototype of all 'Augustan ages', in which a Latin literature had come to its finest flower, had been contemporary with a reprieve which had been won by a Roman political genius for a disintegrating Hellenic Civilization through the establishment of an Augustan Peace.

If, with these conspicuous breaches of our 'law' in mind, we now re-examine the passage, quoted above, in which Berdyaev propounds this 'law' as one that governs the ebb and flow of secular culture, we shall find flaws in the particular pieces of evidence that he cites in support of his thesis.

If, in his citation of English history, Berdyaev had argued his case in terms of Music, he could have pointed out that, in the musical province of secular cultural life, A.D. 1688 was as inauspicious a date in England's history as A.D. 1871 in Germany's, and he could have inferred that a Modern Western bourgeoisie was apt to bury its musical talent as soon as it began to make money in business. Even in this province, however, the English example only partially bears out a 'law of inverse operation' to which the German example conforms with exactitude; for, while it is true of English, as of German, history that music 'slumped' when business began to boom, it is not true, in the English case, that music did not begin to blossom until the country's economic and political life had been overtaken by adversity. The *floruit* of German classical music, whose *terminus ante quem* is A.D. 1871, has also a *terminus post quem* in A.D. 1648; for, as we have noticed, this *floruit* is exactly coincident in duration with the 'trough' in the curve of Germany's political and economic fortunes between the Thirty Years War and the foundation of the Second Reich. On the other hand the musical talent of the English bourgeoisie, which ceased to be cultivated when 'the Glorious Revolution' of A.D. 1688 was followed by a steep and steady rise in British commercial prosperity and naval power, was already being cultivated with ardour in the Elizabethan Age—in which the English were enjoying an intoxicating spell of naval and commercial power—without having to wait for the doldrums of the seventeenth century in order to come into its own.¹

¹ Mr. Martin Wight notes: 'French music partially bears out the law of inverse

Thus, in English history, even Music only partially bears out our 'law', while Poetry—which is the secular art that Berdyaev singles out for citing in his English illustration of his thesis—yields perhaps more evidence against his argument than in favour of it. Berdyaev's contention that 'the mighty civilisation of the British Empire holds no place for either Shakspeare or Byron' is, no doubt, borne out, as far as Byron is concerned, by the portentous spectacle of the eclipse that overtook the muse of Byron's older contemporary Wordsworth after the post-Napoleonic triumph of a British Industrial Revolution. If Byron (*vivebat* A.D. 1788–1824)—or, for that matter, Shelley (*vivebat* A.D. 1792–1822) or Keats (*vivebat* A.D. 1795–1821)—had lived to the same ripe old age as Wordsworth (*vivebat* A.D. 1770–1850), Wordsworth's history suggests that these younger contemporaries of his likewise might have found the spiritual climate of a Victorian England adverse to their poetic genius. On the other hand, Shakspeare's life-span was, of course, coeval with the Elizabethan Age, and this chronological correspondence is no mere coincidence, for the poet was neither hostile nor indifferent to the political and economic triumphs of his countrymen in his lifetime; the excitement of sighting opportunity, and the exultation of rising to the occasion, which was the stimulus of the Elizabethan English pirate and merchant adventurer, was likewise the inspiration of the Elizabethan English playwright and man of letters. The same fire coursed through all Elizabethan English veins; and this feature of an Elizabethan Age of English history reappears in a Victorian Age. Tennyson and Browning were children of the Victorian Age in the same significant sense in which Shakspeare was a child of the Elizabethan; and the last decade of the nineteenth century of the Christian Era, in which the resurgence of Germany's material power was celebrated by the death of the last of the German classical composers of music,¹ saw the recession of Victorian England's material power portended by the deaths² of the two most characteristic of the Victorian English poets.³

operation: it reached its greatest heights (as did French painting) during the first fifty years of the régime of the Third Republic [i.e. during a half-century in which, on the military and political plane, France was under the shadow of the catastrophe of A.D. 1870–1]. Martin Cooper's recent book on *French Music* (London 1951, Oxford University Press) bears the sub-title "From the Death of Berlioz to the Death of Fauré" (A.D. 1869–1924), which is the richest and most varied period in the history of French music. It may be noticed that this is an example of Music's flourishing in a period which, on the plane of practical affairs, was one of *political* decline but of *economic* prosperity. In France, at any rate, the bourgeoisie proved to be as good a patron of the Arts as the Crown had once been.

Mr. John Lodge comments on Mr. Martin Wight's note: 'I think that this is a matter of opinion. Bizet (*vivebat* A.D. 1838–1875) died young but was a composer of genius as well as charm, and Berlioz (*vivebat* A.D. 1803–1869) is to French music what Hugo and Delacroix are to French poetry and French [visual] art. He is their greatest romantic. If you prefer the French Impressionists and Post-Impressionists in painting, you will probably prefer their contemporaries in music.' ¹ Brahms died in A.D. 1897.

² Tennyson died in A.D. 1892, Browning in A.D. 1889.

³ Mr. Martin Wight comments: 'In this application of the law of inverse operation to the history of English poetry, the argument is open to two criticisms: (i) It assumes the comparability and literary-historical equivalence of all the poets that you mention, and (ii) those that you mention are arbitrarily selected. The main massifs in the poetic range do roughly coincide with periods of political power: Spenser, Shakspeare, Donne, with the Elizabethan-Jacobean expansion; Milton with the Cromwellian epoch (if one regards him, like Clarendon, as a personal example of Withdrawal-and-Return, writing his masterpiece in a retirement from politics during the Restoration doldrums); Dryden

Nor, in the provinces of Poetry and the Visual Arts, is our 'law' borne out by Italian history any more convincingly than it is by English history. It is true, as Berdyaev points out, that a Cavourian Italy, like a Bismarckian Germany, blindly buried what survived of her artistic talent in her obsession with the pursuit of material power; but the two arts of which Dante and Michelangelo were respectively masters neither survived in Italy to wilt at the advent of the Risorgimento nor waited in Italy to blossom until the Italians had tasted the political and economic adversity that began to overtake them at the turn of the fifteenth and sixteenth centuries of the Christian Era. The *floruit* of the Italian school of Western Poetry, Painting, Sculpture, and Architecture was coeval with the age in which the city-states of Northern and Central Italy were successful in maintaining their political independence and in making their country the workshop and emporium of the World;¹ and in a Late Medieval Italy, as in an Elizabethan and in a Victorian England, the contemporaneity of the blossoming of these arts with the achievement of material power was not just a chronological coincidence. Here, too, there was an inner psychological connexion between these two diverse manifestations of *virtù*. To find an Italian illustration of the working of our 'law' in the secular field, Berdyaev would have had to surrender Poetry and the Visual Arts and take his stand on Music; for here the Italian pattern is in truth the same as the German. A golden chain which begins with Palestrina (*vivebat* A.D. 1526-94) and ends with Verdi (*vivebat* A.D. 1813-1901) does exactly span the political and economic 'trough' in Italian history which extends from Charles VIII's crossing of the Alps in A.D. 1494² to Victor Emmanuel's entry into Rome in A.D. 1870. The zenith of the Italian Opera coincides in date with the nadir of Italian wealth and power, and this synchronism is too suggestively reminiscent of its German counterpart for us to be able to dismiss it as a freak of Chance.

What is the upshot of the foregoing survey? It has already made two things clear. In the first place, our 'law' that spiritual achievement and material achievement are antithetical proves not to have equal validity in all cultural provinces. Its manifest operation in the field of Religion was the clue which originally led us to formulate it; and we can now see that we might also have arrived at it by another road if our starting-

and Pope with the age of William and Marlborough (but in the later Augustan Age we lack a poetic peak to correspond to Chatham: Gray scarcely fills the bill, though Johnson, whose genius was not poetic, would exactly fill it); and the Romantics, from their conventional beginning with the publication of *Lyrical Ballads* in 1798 down to their dim 'Georgian' swan-song with Rupert Brooke dying at Scyros in 1915, with the post-Napoleonic *Pax Britannica*. But most critics would judge that the general level of poetical genius in this series *descends*, running transversely to the ascending line of political power: they would see the Elizabethans as a Golden Age and Tennyson in terms of a Silver Age. And by common consent the two highest poetical peaks, Shakespeare and Milton, come at the beginning of the range. So perhaps one gets the law of inverse operation working within the limits of a broad coincidence of poetical and political achievement.

'It is worth noting that there is a fairly considerable massif, whose chief peaks are Yeats and Eliot, rising out of the waste land of Britain's loss of Great Power status in the twentieth century—fairly considerable, but not big enough in relation to the whole range to show a poetical efflorescence succeeding or coinciding with a collapse of political power.'

¹ See III. iii. 342.

² See *ibid.*

point had been, not Religion, but Music. If, however, our starting-point had been Poetry, the Persian and German exemplifications of the working of the 'law' would have been offset by the Attic, Italian, French, and English breaches of it; while, if we had started with a survey of the social conditions in which the Visual Arts have blossomed and wilted, we might have been led, by the evidence in this field, to formulate the precisely contrary 'law' that spiritual achievement and material achievement are, not antithetical, but interdependent; for the consensus of the Attic, Italian, and Dutch evidence in this sense would probably have weighed more heavily in our estimation than the contrary evidence from Sparta and from the Stone Age. Can we bring any order out of the apparent confusion into which our well-tried empirical method of inquiry might appear to have led us in this instance?

One conclusion that is suggested by the facts now before us is that there is an intrinsic incompatibility between the quest of the Beatific Vision, which is the goal of Religion, and the pursuit of material power in any of its forms. Another conclusion is that the secular vein of spiritual activity is a middle term between Religion on the one hand and the pursuit of material power on the other. When we dissect this secular spiritual activity into its diverse expressions in Music, Poetry, and Visual Art, we find that Music is apt to obey the same 'law' of ebb and flow as Religion, and Visual Art the same 'law' as the pursuit of power, while Poetry behaves equivocally—reacting in German and Persian history like Music and Religion, and in Attic, Italian, French, and English history like Visual Art and the pursuit of power. These tentative conclusions seem warrantable; for the truth is that Human Life on Earth is lived in two societies simultaneously—the Ergastulum of Leviathan and the Commonwealth of God¹—and each of these ways of life has its own spiritual dynamic: the inspiration of the Grace of God and the stimulus of the Pride of Life.² The evidence suggests that Visual Art is apt to respond to the Pride of Life more readily than to a Grace of which the price is material adversity; that those adverse conditions of material life that are propitious for Religion are also propitious for Music; and that Poetry, in contrast to both her sister arts, is a turn-coat chameleon, who can take colour from the stimulus of Pride as readily as from the inspiration of Grace.

The classic case in which Poetry had followed the course of Religion in first blossoming at the breath of mundane adversity and then wilting at the breath of mundane prosperity was presented by the Islamic chapter of Persian history; and in this case it was manifest that Poetry had drawn its inspiration from a religious source. 'The close connexion between Poetry and Belles Lettres on the one hand and Sufi-ism and Mysticism on the other, at any rate in Persia, is obvious, so that the extinction of the one necessarily involves the extinction of the other.'³

¹ See V. vi. 149-68 and 365-9; and pp. 558-61, above.

² 'Fecerunt itaque civitates duas amores duo, terrenam scilicet amor sui usque ad contemptum Dei, caelestem vero amor Dei usque ad contemptum sui' (St. Augustine: *De Civitate Dei*, Book XIV, chap. 28).

³ Letter, dated the 24th May, 1911, from Mirzā Muhammad Khan of Qazwīn to Professor E. G. Browne, quoted in I. i. 394 (cp. loc. cit., p. 363, n. 3).

After the forcible conversion of Persia from the Sunnah to the Shī'ah by the Safawis, the triumphant Shī'i divines waged a relentless war against the dervish monasteries, and Poetry as well as Mysticism was eradicated in the destruction of a religious institution in which Mysticism and Poetry alike had found a spiritual home.

We may also cite one conspicuous case in which the course of Religion had been followed by Visual Art. A classical Hellenic art which had gone into decline at the onset of the second bout of an Hellenic Time of Troubles at the turn of the third and second centuries B.C.¹ had been eventually discarded—by an latter-day generation of Hellenes whose experience of suffering had sickened them of the Pride of Life—in favour of a revolutionary Byzantine art whose aim was not to portray the body but to minister to Religion by expressing the Soul.²

Note by MARTIN WIGHT on VII. A (iii) (a), Annex I

SPIRITUAL AND MATERIAL ACHIEVEMENT: THE LAW OF INVERSE OPERATION IN ITALIAN VISUAL ART

I think your generalization about the *floruit* of Italian art is so broad as to be inaccurate: it requires closer analysis.

The four great poets come squarely at the beginning and at the end of the political independence of the city-states: Dante and Petrarch in the fourteenth century, when Italy finally emancipated itself from the remains of Imperial and Papal political control; Ariosto (*vivebat* A.D. 1474–1533) and Tasso (*vivebat* A.D. 1544–95) in the sixteenth century, when Italy fell under Spanish control. The fifteenth century, which was the political heyday of the city-states, produced no great poet. Here there is something of inverse operation.

It is also visible in Painting, Sculpture, and Architecture. These ascended steadily up to the High Renaissance in the two generations after the collapse of the city-state cosmos in A.D. 1494, and the supreme artists lived through or were stimulated by the 'invasion of the barbarians'. Botticelli was deeply influenced by Savonarola and experienced the destruction of Florence as a Great Power. Raphael, whose life has fewest political *rappports*, was summoned to Rome by Julius II, the last pope under whom the Papal States played the role of a Great Power. Leonardo was in the service of Lodovico Sforza, under whom Milan lost its Great Power status, and he ended his life in the service of the French conqueror. Michelangelo's life was interwoven with the collapse of the Papacy as a temporal Great Power, and he was practically the last engineer of the fortifications of republican Florence before the city was finally reduced to being a satellite of Spain through the Medici restoration of A.D. 1530. Venetian art ascended from the Bellini through Giorgione (*vivebat* A.D. 1475?–1510) to its peak in Titian (*vivebat circa* 1485–1576) and Tintoretto (*vivebat* 1518–94), while Venice lost her Great Power status in the twin battles on land and sea of Agnadello and Diù

¹ See V. vi. 287–91.

² See IV. iv. 54–55.

in 1508; and Berenson sees the political catastrophe as a challenge by responding to which the Venetian artistic tradition was etherialized and carried to its greatest heights.

'But even while such pictures [as the early works of Titian] were being painted, the spirit of the Italian Renaissance was proving inadequate to Life. . . . Life began to show a sterner and more sober face than for a brief moment it had seemed to wear. Men became conscious that the passions for knowledge, for glory, and for personal advancement were not at the bottom of all the problems that Life presented. Florence and Rome discovered this suddenly, and with a shock. In the presence of Michelangelo's sculptures in San Lorenzo, or of his "Last Judgement", we still hear the cry of anguish that went up as the inexorable truth dawned upon them. But Venice, although humiliated by the League of Cambrai, impoverished by the Turk, and by the change in the routes of commerce, was not crushed, as was the rest of Italy, under the heels of Spanish infantry, nor so drained of resource as not to have some wealth still flowing into her coffers [an example of the golden mean of the stimulus of blows?]. Life grew soberer and sterner, but it was still amply worth the living, although the relish of a little stoicism and of earnest thought no longer seemed out of place. The spirit of the Renaissance had found its way to Venice slowly; it was even more slow to depart.

'We therefore find that towards the middle of the sixteenth century, when elsewhere in Italy painting was trying to adapt itself to the hypocrisy of a Church whose chief reason for surviving as an institution was that it helped Spain to subject the World to tyranny, and when portraits were already exhibiting the fascinating youths of an earlier generation turned into obsequious and elegant courtiers—in Venice painting kept true to the ripened and more reflective spirit which succeeded to the most glowing decades of the Renaissance. . . .

'It is scarcely to be wondered at that the Venetian artist, in whom we first find the expression of the new feelings, should have been one who by wide travel had been brought into contact with the miseries of Italy in a way not possible for those who remained sheltered in Venice. Lorenzo Lotto, when he is most himself, does not paint the triumph of Man over his environment, but in his altar-pieces, and even more in his portraits, he shows us people in want of the consolations of religion, of sober thought, of friendship and affection. They look out from his canvases as if begging for sympathy.

'But real expression for the new order of things was not to be found by one like Lotto, sensitive of feeling and born in the heyday of the Renaissance, to whom the new must have come as a disappointment. It had to come from one who had not been brought in personal contact with the woes of the rest of Italy, from one less conscious of his environment, one like Titian who was readier to receive the patronage of the new master than to feel an oppression which did not touch him personally; or it had to come from one like Tintoretto, born to the new order of things and not having to outlive a disappointment before adapting himself to it.'¹

Thus, while superficially there seems to be a broad contemporaneity between the blossoming of Italian art and the achievement of material power by the city-states, if it is examined more closely a different relationship is seen. There is a time-lag between the political zenith and

¹ Berenson, Bernhard: *The Italian Painters of the Renaissance*, revised ed. (London 1932, Oxford University Press), pp. 31-33.

the artistic zenith. The supreme artistic achievements of the High Renaissance are an after-glow of the political Golden Age of the city-states whose passing Guicciardini laments at the beginning of his history, or like the shower of stars emitted by a rocket when it reaches the highest point of its trajectory, Michelangelo and Titian being the two brightest and most long-lasting—just as El Greco was a still more delayed coruscation of the East Roman Empire (cp. IV. iv. 360–1).

There are two other striking examples of such inverse operation in the history of European Visual Art. One is provided by Spanish painting: Velasquez is to the decline of the Spanish Monarchy as Titian is to the decline of Venice, or as Michelangelo to the decline of Florence and Papal Rome. The other is a more important example. The only movement in European painting which can be compared with the Italian Renaissance, in the richness of its variety within a coherent tradition and in its profusion of great artists, is the French painting of the nineteenth century; and this appears as a 'compensation' for the post-Napoleonic political decline of France. 'Impressionism' was first used as the name of a school in A.D. 1863, and the *floruit* of the great Impressionists and Post-Impressionists was in the generation and a half between 1871 and 1914.

Against these three examples of inverse operation can be put the Dutch school, which, as you say above (p. 707), had its apogee in Rembrandt contemporaneously with the apogee of Dutch power, and the British school, which, if we roughly identify it with Reynolds, Gainsborough, Constable, and Turner, runs from A.D. 1723 when Reynolds was born to 1851 when Turner died,¹ and coincides closely enough with British political supremacy.

Perhaps the Flemish Renaissance could be pressed into service on the side of the examples of inverse operation, and seen as having the same relation to the independent Burgundian Power as the Italian Renaissance has to the Italian city-states, with Bruegel in the role of Michelangelo or Titian. 'The whole school provided, in fact, a kind of Gothic swan-song with Pieter Brueghel [*sic*] as its final climax.'² The German Renaissance is more difficult to fit into the pattern; and Rubens escapes through the net altogether. But perhaps enough has been said to suggest that there is at least as much inverse operation as interdependence in the case of the Visual Arts, and that the Visual Arts are therefore not less ambiguous than Poetry in this respect.

However, three last points need to be made. (i) This is only a cursory survey of European painting. To discover a 'law' of the Visual Arts that could claim any validity one would have to examine the art of at least the Byzantine World, Persia, India, and China as well. And probably the findings would be equally ambiguous. For example, 'it is noticeable that, throughout Indian history, architecture and sculpture have followed the moving centres of political power'.³ Similarly the Mughal

¹ Mr. John Lodge comments: 'I would add Hogarth (*vivebat* A.D. 1697–1764), and so cover the period more completely.'

² Newton, Eric: *European Painting and Sculpture* (London 1941, Pelican Books), p. 92.

³ John Irwin in *Indian Art, essays . . .* edited by Sir Richard Winstedt (London 1947, Faber), p. 92.

Empire at its zenith produced a great school of painting; on the other hand, Rajput painting seems to have been stimulated by the decentralization of art patronage that accompanied the decline of the Mughal Rāj, and flowered in the eighteenth and nineteenth centuries.

(ii) The danger of seeking to define the relationship between artistic and material achievement is that the political environment, which is only a conditioning factor, becomes subtly exaggerated into the determinant. For example, were the French Impressionists a response to a challenge of the political decline of France, or a development of the inspiration of Constable and Turner? An art historian would prefer the latter explanation. El Greco was born in Crete, worked in Venice perhaps as Titian's pupil, and settled in Spain when Philip II was at the height of his power. Is he to be treated as a late coruscation of the East Roman Empire, as an apprentice of the Venetian school at its zenith, or as the artistic epiphenomenon of the Spanish political apogee? Or was he an inspired vagrant who cross-fertilized schools like a wandering bee? Most art historians would regard him as an isolated figure who cross-fertilized only his own genius and whose influence was not fully felt until the French Post-Impressionists. With Rubens, again, was not the inspiration that he gained from the Italian masters when he was in Mantua more important than the political régime of the archduke Albert and archduchess Isabella in Flanders which enabled him to develop the inspiration, so that he must properly be described in terms of an international baroque movement? It seems that individual genius in art is more closely conditioned by artistic tradition than artistic tradition itself is conditioned by the political and social environment. The ultimate truth about artistic activity, as about all spiritual activity, is in terms of the wind blowing where it listeth and 'light caught from a leaping flame'.

(iii) The concept of 'inverse operation' needs to be analysed with much more precision before it can be really useful. At least three different kinds of inverse operation are seen from your discussion. (a) There is the time-lag or 'after-glow', when an artistic tradition has been established during a period of political prosperity, but produces its supreme achievements after political prosperity has ended. The Italian Renaissance is the classic example. (b) There is what might be called, by contrast, the 'radiant morning', when an outburst of artistic genius accompanies the beginnings of political power, but the artistic level sinks as material power expands. I have suggested that English poetry illustrates this.¹ (c) There is simple compensation, when an artistic efflorescence comes after the loss of material power, and the artistic tradition has not in any notable way been established earlier. The classic examples are German or Italian music.

Can we say that (a) tends to be illustrated by the Visual Arts, (b) by Poetry, and (c) by Music? It looks as if a tradition in the Visual Arts ascends slowly to its highest point and then falls sheer away, while a tradition in Poetry scales its highest point in about a generation and then descends gradually away. But this would be a generalization from far too few examples, and every example changes its shape, like Proteus,

¹ See p. 708, n. 3, above.

when you try to pin it down and classify it. For instance, the great German poetical efflorescence coincides with the musical efflorescence and seems therefore to illustrate (c) rather than (b). But on second thoughts they can both be made to illustrate (b). For it is inaccurate to regard the period from 1648 to 1871 as a continuous undifferentiated nadir of material adversity for Germany. From 1740 onwards the prostrate giant was stirring and preparing himself for 1871, and we could if we chose regard Lessing, Goethe, Schiller, and Hölderlin as the expression of the political renaissance of Germany, just as we regard the Elizabethan poets as the expression of the English *Befreiungskrieg* against Spain. The same is true of Music, for did not Bach, the first of the supreme masters, regard it as the climax of his career when in 1747 he was summoned to visit Frederick the Great at Potsdam?

It is this protean quality of our paradigms, rather than their insufficient quantity,¹ which makes an inquiry of the kind pursued in this Annex so unsatisfactory to the social scientist, who requires scientific precision and seeks firm laws in dealing with human history. But it seems to me that spiritual and artistic activity is intrinsically not susceptible to treatment by the scientific method, and that the 'laws' which you discuss do not aim to be demonstrable and universally valid, but are of a quite different character. Their aim is to refine the appreciation of a relationship between spiritual facts and their material contexts, not to demonstrate a causal connexion; their method is qualitative, not quantitative; and they are apprehended, not by the scientific mind, but by something much more like the aesthetic sensitivity of the critic—of which the quotation from Berenson above is an example.

¹ Mr. John Lodge comments: 'There is so much that has had to be passed over. How about Camoens in relation to Portuguese voyaging and its consequences, and Cervantes, Lope de Vega and Calderón in the Spanish picture? How about Pushkin and Tchaikovsky (not to mention Tolstoy, Dostoyevsky and others) in the story of Russia?'

HIGHER RELIGIONS AND PSYCHOLOGICAL TYPES

IN the main stream of this Study¹ we have struck upon the probability that each of the higher religions might satisfy some widely experienced human need, and the possibility that each of them might correspond and minister to one of the psychological types into which Human Nature appears to be differentiated. These vistas of which we have caught a glimpse in passing are perhaps worth exploring further.

We may begin with a point on which we touched in an earlier passage of the same chapter.² Each of the higher religions had been apt to lay stress on some particular aspect of God's relation to Man, or of the individual soul's relation to the religious community, or of the religious community's relation to the political; and, even when it had not repudiated the complementary antithetical aspects in theory, it had been apt to ignore them in practice owing to the difficulty of bringing opposite poles together into a single harmonious *Weltanschauung* and way of life. When this insistence on one aspect, to the depreciation of others, had been carried far, it had been apt to evoke a counter-insistence on opposing aspects which could not be suppressed with impunity because they, too, had a truth and value which Human Nature could not afford to sacrifice. The counter-movement might take the form either of a new current within the old religion or of a new religion altogether; and, when it declared itself, it was apt to 'compensate' for the previous depreciation of the aspect which it was championing by unduly emphasizing this aspect in its turn—thereby laying itself open to a reaction against itself in the original direction against which it had set its own face.

The difficulty of reconciling the two poles of an antithesis cannot in fact be solved by holding to the one and despising the other;³ and a man is constrained to serve two masters as best he may, when he cannot dispense with either. On the plane of Religion the feminine epiphany of the Godhead as the Great Mother is difficult to reconcile with Its masculine epiphany as the Father of gods and men. The forbidding aspect of God as a jealous aloof judge is difficult to reconcile with the consoling aspect of God as a loving intimate saviour. The aspect of worship as a social act performed by a congregation, under the leadership of a priest who is a necessary mediator between the laity and God because he has a monopoly of the power to celebrate the liturgy, is difficult to reconcile with the aspect of worship as a direct communion between the individual soul and God, in a 'flight of the alone to the Alone'⁴ without witnesses or intermediaries. The primitive undifferentiated identity of the religious with the secular community is difficult

to reconcile with the separation of Church from State which was a specific characteristic of the higher religions.¹ These psychological difficulties had left their mark on the history of the higher religions' relation with one another.

The victory of Christianity in its competition with Isis-worship and Cybele-worship for the allegiance of the internal proletariat of a disintegrating Hellenic Society had not availed permanently to suppress altogether an Isiaco-Cybelene vision of a triune godhead in which the first of the three persons had worn a feminine aspect.² In the victorious Christian presentation of the Trinity the genius of Motherhood had not only been deposed from the first place; it had been ejected from the Godhead altogether in the doctrine of an Incarnation in which the Second Person of the Trinity was held to have been born of a human mother at the cost of deliberately divesting Himself of His divine power and glory.³ But a Trinity in which even the Third Person, as well as the First and the Second, had been reduced to masculine form had left the Psyche baulked of all means of satisfaction for its persistent and imperious impulse to pay worship to a principle of Motherhood which was both the primal and the dominant experience of every child born into the World; and the Great Mother had no sooner been thrust down from Heaven to Earth than She was raised again from Earth to Heaven in the transfiguration of Mary the human mother of Jesus of Nazareth into a Great Mother of God (*Theotókos*) capable of filling the intolerable vacuum that had been created by the previous deposition of Isis and Cybele. Yet this had not been the end of the story; for an antimatriarchal feeling that had once asserted itself in the replacement of an Isiac or Cybelene by a Christian presentation of the Trinity had eventually reasserted itself in an Islamic, Iconoclast, and Protestant series of revolts against 'Mariolatry'; and the Protestant attack on what looked, to Protestant eyes, like an avatar of Isis-worship and Cybele-worship within the bosom of a Western Christian Church had evoked in its turn, in Catholic Western Christian hearts, a more fervent devotion to the threatened person of Our Lady which had found expression in the successive promulgations of the dogmas of the Immaculate Conception and the Assumption.

The forbidding aspect of God, as Power, which had been presented in the Mosaic matrix of Judaism, had not been ousted completely or permanently by the consoling aspect of God as Love which had been presented in the Christian revelation. Islam had broken with Christianity in order to reinstate Yahweh under the name of Allah; and, in the Christian scheme itself, the lineaments of Yahweh were recognizable not only in the First Person of the Trinity, who had become Man's Father without having ceased to be his Lord, but also in the Second Person, who had become Man's judge as well as Man's saviour. This aspect of Christ as the Almighty Judge (*pantokrátor*) had been emphasized by the Eastern Orthodox Church, and the stern and melancholy bearded figure which was the latter-day conventional representation of

³ 'Εαυτὸν ἐκένωσεν — Phil. ii. 7.

Christ in this role in Orthodox iconography bore no recognizable resemblance to the mild and gracious likeness of Orpheus in which the Primitive Church had depicted her conception of the Good Shepherd on the walls of the Catacombs. In a Western Christian Church the same Judaizing reversion from emphasis on God's loving intimacy with Man to emphasis on God's formidable transcendence had asserted itself, at a later stage, in the Protestant Reformation; and, when the enforcement of the political regulation *Cuius Regio Eius Religio*¹ had deprived Western Christians of the opportunity of making a personal choice between Catholicism and Protestantism, and had made Religion in Western Christendom depend again upon the accident of the subject's birth-place, the craving for a return to a more Judaic view of God, which had been debarred from expressing itself any longer through the channel of Protestantism in a France in which Catholicism had succeeded in re-establishing itself as the religion of the state, had found satisfaction on French soil in Jansenism, which was the nearest approach to Calvinism that could be contrived within a Catholic framework.²

Thus, where the intimate aspect of God's relation to Man had been to the fore, the transcendent aspect had persistently reasserted its claim to due consideration; but, in obedience to the same 'law' of psychological compensation, the converse tendency had likewise been persistently at work where the transcendent aspect had been dominant. The Christian revelation of God incarnate in Jesus Christ had not been the first intimation to Jewish souls of the truth that God is Love. The Mosaic presentation of Yahweh as a Jealous God, readily moved to anger, had been supplemented by the Prophetic presentation of Him as abounding in mercy and loving-kindness seven hundred years before the Christian Gospel was first preached; and this pre-Christian Judaism had even relaxed the rigidity of its monotheism so far as to associate with its One and Indivisible God a Word³ and a Wisdom which—when personified on the excuse that the one was merely an utterance and the other merely an attribute—had come near to anticipating the Second and Third Persons of the Christian Trinity in Unity. It is noteworthy that the same craving to give expression to the intimate aspect of God's relation with Man should have asserted itself in Islam, which had originally stood for an uncompromising reversion to a Jewish monotheism from a Christian 'polytheism'.

The orthodox Islamic Sunnah had no sooner established itself than it was challenged by a Shi'ah which had found new suffering saviours incarnate in the persons of 'Alī, Hasan, and Husayn and which was carried by enthusiasts to the extreme of identifying 'Alī with God. The

¹ See V. v. 646-712.

² 'Can it be wholly by chance that, whereas Cassian advocated free will, frequent communion and holy dissimulation, the Jesuits of the seventeenth century did likewise; and that, whereas Augustine and Prosper of Aquitaine disapproved of free will and of holy dissimulation, the Jansenists did likewise? And may not this coincidence betray two natural dispositions of mind rather than mere attachment to two traditional schools of thought?' (Pickman, E. M.: *The Mind of Latin Christendom* (London 1937, Oxford University Press), p. 481, n. 78). For the significance of Jansenism, see further XI, ix. 304.

³ See the passages in Eduard Meyer's *Ursprung und Anfänge des Christentums* cited in V. v. 539, n. 4, and in V. vi. 270, n. 3.

strength and ubiquity of the demand for a divine saviour in human form in an Islamic World that was officially dedicated to the dogmas of unitarianism and transcendence is indicated by the persistent revival of Shi'ism after persistent attempts to repress it in almost every province of Dār-al-Islām; and, when, in the early years of the sixteenth century of the Christian Era, the political regulation *Cuius Regio Eius Religio* was imposed in the Iranic Muslim World, a generation before its imposition in Western Christendom, in consequence of a personal clash between Ismā'il Shah Safawī and Sultan Selīm I 'Osmanlı,' the same thing happened in sixteenth-century Turkey as in seventeenth-century France. When Muslims were deprived of the opportunity of making a personal choice between the Sunnah and the Shi'ah owing to the official establishment of Sunnism as the religion of the Ottoman Empire and Shi'ism as the religion of the Safawī Empire, the craving for a God Incarnate found satisfaction on Ottoman soil in the Bektashi Order of Dervishes and in the Qyzyl Bāsh village communities that were affiliated to it.² Bektashism was a crypto-Shi'ism which discreetly refrained from advertising its religious beliefs and from translating them into political action in favour of the Safawī cause; and the Ottoman Government found it politic tacitly to tolerate this politically innocuous version of Shi'ism, because it realized that this was the smallest ration of an indispensable spiritual vitamin, lacking in the Sunnah, to which the spiritually starved subjects of a Sunni Government could safely be reduced without danger of a political explosion. It was notorious that Bektashism was the regimental religion of the Janissaries, and it has been estimated that, under the Later Ottoman Empire, more than half of the Turkish-speaking Muslim population was addicted to crypto-Shi'ism in some form.³

The pre-emergence in Judaism, and re-emergence in Islam, of the intimate aspect of God's relation to Man which is prominent in Christianity is not, however, so remarkable as the assertion of this intimate aspect in Buddhism, where the apparently ubiquitous and perpetual human craving for an expression of it actually availed to bring about the *tour de force* of conjuring the Mahāyāna—a consoling popular religion offering salvation by faith in a bodhisattva⁴—out of the forbidding Primitive Buddhist philosophy of the Hīnayāna.⁵

If we pass now from the question of God's relation to Man to the tension between congregational and individual worship, we shall encounter, in this different field, the same spectacle of a tug-of-war between two antithetical but equally importunate spiritual needs. The 'priestcraft' and 'ritualism' which Primitive Christianity had rejected in reaction to a priest-ridden and law-bound Judaism had conspicuously

¹ See I. i. 382-400.

² See Birge, J. K.: *The Bektashi Order of Dervishes* (London 1937, Luzac).

³ See IV. iv. 68-69 and V. v. 111 and 295, in the present Study; and Birge, op. cit., pp. 13-15.

⁴ See V. v. 133-6, 552; and V. vi. 20.

⁵ See V. v. 133-4; V. vi. 18 and 142-3. In these contexts it has been pointed out that we have no warrant for assuming that the tenets of the Hīnayānian philosophy reproduce the personal beliefs of the Buddha, Siddhārtha Gautama, himself, about the Soul and God.

reasserted itself in both the Eastern Orthodox and the Western Catholic Christian Church; and in the Protestant Western Christian Church—which, on this issue, had originally been a reversion, not to Judaism, but to Primitive Christianity—it had again reasserted itself in Episcopalianism in general and in Anglo-Catholicism in particular. A priesthood and ritual reminiscent of those of the Orthodox and Catholic Christian churches had likewise been conjured by the Mahāyāna out of the simple fellowship of the Primitive Buddhist monastic community. Yet the institutional form of worship had never been exempt from challenge by the personal form that was its antithesis. Both Islam and Protestantism stood, in general, like Primitive Christianity, for a reversion from 'priestcraft' to a direct personal communion between the individual soul and God; and this perennial need, which had asserted itself as Protestantism in a Western Christendom, had similarly asserted itself in a Russian Orthodox Christendom in divers dissenting sects.¹

Finally, if we glance at the vicissitudes in the relation between Church and State, we shall observe that, on this issue, Islam had stood for a reversion from Christianity to a 'totalitarian' paganism of the Hellenic type; and we shall also observe that, by contrast with a Western Christendom, an Eastern Orthodox Christendom, in its re-subjection of the Church to the State,² as in its re-minting of the image of Christ in the likeness of the First Person of the Trinity, had moved in the same direction as Islam, though without having had quite that courage of its convictions which had been one of Islam's virtues. The same tendency had eventually overtaken the Western Church in its turn since the failure of the Medieval Papacy to achieve the Hildebrandine ideal of a *Respublica Christiana* in which a commonwealth of parochial secular states was to find its unity under the auspices of the Apostle at Rome;³ and it was significant that, in a Modern Western Christendom, this re-subjection of the Church to the State had not been confined to Protestant countries in which the supreme ecclesiastical power had been transferred, since the Reformation, from the Pope to the secular sovereign of a parochial principality. Catholic sovereigns had been as Orthodox-minded as their Protestant cousins in the keenness of their appetite to arrogate to themselves as many of the Pope's ecclesiastical prerogatives as they might find themselves able to filch without putting themselves outside the pale of the Catholic Communion.⁴

Thus the tension produced by the separation of the Church from the State at the birth of the higher religions had persistently sought relief in a remerging of the Church into an undifferentiated 'totalitarian' social order of the primitive kind. Yet the tendency to separation had no less persistently reasserted itself. In Islam it had been reasserted in the Shī'ah; and in a Safawī and post-Safawī Persian Empire, in which the Shī'ah had been converted into the established religion of a state by a *tour de force*, the secular authorities had never succeeded in taming the *mujtahids*—not even those who were resident at Qum, under the Persian

¹ For these Russian Orthodox Christian Non-conformists, see II. ii. 222.

⁴ See IV. iv. 578.

Government's nose,¹ not to speak of their still more authoritative brethren who laid down the law for the Persian Government's subjects from fastnesses in the Shī'ī holy cities of 'Irāq which had been beyond the range of the Persian Government's arm since A.D. 1546, when Suleymān the Magnificent had carried the Ottoman frontier right down to the head of the Persian Gulf.² This latent power, exercised on critical occasions, of not only defying but coercing the otherwise omnipotent secular authorities was characteristic, not only of the *mujtahids* in and on the margin of a Shī'ī Persian Empire, but of the anchorites in Orthodox Christian states.³ Even in the realm of the Sunnah, the Commander of the Faithful, omnipotent though he had been in secular affairs, had had to defer, in matters of religion, to a consensus (*ijmā'*) of the doctors of the religious law (*Shari'ah*);⁴ and, in Protestant countries in which the secular sovereign had succeeded in acquiring the ecclesiastical prerogatives of an East Roman Emperor in Orthodox Christendom, the inevitable Shī'ah had presented itself in the shape of nonconformist 'free churches'.

This ebb and flow in which, in the history of the higher religions, antithetical features of religious life had asserted and reasserted themselves against one another in divers fields, without any of them ever either succeeding in permanently suppressing their opposites or succumbing to being permanently suppressed for their own part, might throw some light on the relations between the elemental practices and beliefs of the higher religions and the permanent needs of the Human Psyche.

The historical phenomena suggested that the distinctive spiritual stance of each of the higher religions must have been so oriented as to give some of the more important of these permanent psychic needs their due satisfaction, but that, just because each single religion had been thus effectively oriented towards satisfying certain particular needs, any single religion would inevitably prove not to be sufficiently catholic to be able to meet all the Psyche's permanent needs without making a tacit confession of its own congenital limitations by the impressively humble act of borrowing from one or more of the other historic higher religions some of the elements that inevitably would be lacking in the debtor religion's own spiritual gamut. In thus receiving from abroad elements overlooked in, because antithetical to, its own distinctively limited standpoint, a religion would be found guilty of inconsistency and self-stultification only in the verdict of a judge who took seriously the claim—officially filed by each of the Judaistic higher religions—that it alone was a uniquely complete and all-sufficient revelation of the Truth and vehicle of Salvation for all human souls on Earth, and that any other so-called 'religions' that might have had the hardihood to file

¹ In Persia in A.D. 1924 the *mujtahids* of Qum had prevented the dictator Rizā Khān Pahlawi from following his Ottoman Turkish contemporary Mustafā Kemāl's example by proclaiming a republic (see *Survey of International Affairs*, 1925, vol. i (Oxford 1927, University Press), p. 537).

² See I. i. 390.

³ See pp. 388-90, above.

⁴ A crucial case in which the Grand Muftī Sheykh Jemālī is reported to have prevailed over the formidable Ottoman Pādishāh Selim the Grim, has been noticed in V. v. 706, n. 1, and in V. vi. 204, n. 1.

an identical claim were debased coins, which a rash soul would accept at their face value at its mortal peril since in these other currencies the best part of Religion's essential gold content had been replaced by an alloy.¹ It would be more just, as well as more merciful, to judge the attitude of each religion towards its fellows, not by its official professions, but by its practical conduct, and, on this practical criterion, a receptivity that was inconsistent with a pretension to self-sufficiency was to be taken as a sign of grace because it would be a sign of a practical humility underlying a verbal parade of hybris.

It might further be inferred from this historic receptivity of each of the higher religions to the diversely distinctive genius of each of the other representatives of its species that a claim to catholicity, which, when filed by any single higher religion, was tacitly refuted by the record of its own syncretistic practice, might be valid if it were to be filed on behalf, not of any single higher religion exclusively, but of all the higher religions collectively. A salutary impulse, in the hearts of some, at least, of the adherents of each higher religion, to win access to this catholic revelation of the Truth and catholic means of Salvation, that were to be found in all the higher religions taken together, would then account for those constant psychological tensions in the bosom of the body social and in the secret places of the individual soul which, in the institutional history of Religion, had been reflected in the constant antithetical tendencies that have been coming to our notice in this Annex.

If these tensions and conflicts are thus to be diagnosed as symptoms of a struggle to achieve a catholicity in Religion which was not to be found in the distinctive standpoint of any single one of the historic higher religions, the question then arises whether the limitations displayed by each of the higher religions were merely unfortunate historical accidents, or whether the historic orientation of each religion, from which each religion's distinctive limitations had manifestly arisen, was the inevitable adaptation of a human institution to some intrinsic and fundamental feature in the pattern of Human Nature. Some light on the answer to this question might perhaps be obtained by a confrontation of the phenomena which we have just been considering in the history of Religion with certain apparently analogous phenomena in the structure of the Psyche that had been brought to light in one of the leading schools of a post-Modern Western science of Psychology. If, in the light of these religious phenomena, we look at the chart of psychological types which had been plotted out by the pioneer explorer C. G. Jung,² can we tentatively discern any correspondences between these permanent types of psychic orientation and the historic orientations of the living higher religions, and (to push our analysis a stage further) between the sub-varieties of the psychological types and the orientations of the sects into which each of the higher religions had come to be divided?

¹ A Catholic friend of the writer's comments: 'A Catholic believes that there is a lot of good in other religions, but he does also believe that there are elements in the Catholic Faith which are necessary for all men: Redemption and the Sacraments.'

² See Jung, C. G.: *Psychological Types*, English translation, new impression (London n.d., Kegan Paul), *passim*, but especially pp. 412-517; Wickes, F. G.: *The Inner World of Man* (New York 1938, Holt), pp. 56-64.

Jung distinguishes two antithetical attitudes and four diverse faculties¹ of the Psyche which occur in a variety of combinations—though not all the mathematically conceivable combinations are possible in real life. The two attitudes are an 'introversion' towards the inner world of the Psyche (the microcosm) and an 'extraversion' towards the outer world of Objective Reality (the macrocosm). The four faculties are thinking, feeling, sensation,² and intuition.³ Both the attitudes and all the four faculties are to be found in the psychological 'make-up' of every human being; the psychological differences between individuals which stamp them as representatives of different psychological types arise, not from the presence or absence of this or that psychological element (all the six elements being present in every psyche), but from differences in these omnipresent elements' relative strength and degree of development. Thus the 'introvert' and 'extravert' types are those in which respectively 'introversion' and 'extraversion' is the dominant attitude but not the exclusive one, since the subordinate attitude is not eliminated but is merely repressed into the Subconscious; and similarly, in a classification by faculties instead of by attitudes, the thinking, feeling, sensory,⁴ and intuitive types are those in which the faculty from which the type is named is the predominant one in the sense of being the faculty of which the Consciousness is the most clearly aware and over which the Will has the greatest power of control. The faculties that are subordinated in each type are not eliminated in that type; if they cannot be taken into the service of the predominant faculty as its auxiliaries, they are repressed into the Subconscious, where they lead an outlaw's life of their own beyond the range of the Consciousness and the Will—hovering as qāzāqs on the fringe of the Great Khān's realm⁵ and awaiting their opportunity to take their revenge (if the repression is unduly severe) by breaking out into disconcerting revolts against the ascendancy of a consciously organized and deliberately directed upper level of the Psyche.

The four faculties range themselves in two pairs:

"Thinking and feeling are rational—controlled by judgement and proceeding in accordance with logical steps. . . . Intuition and sensation, on the other hand, are essentially irrational [even] in their differentiated [i.e. in their conscious] form. They do not proceed by logical steps, but their conclusions seem to come of themselves without the intervention of the intermediary processes. Intuition suddenly finds itself at the end of the road, but has no idea of how it got there; whereas sensation finds itself sitting firmly upon an established fact, without any concern as to the implications of that fact or its relation to past and future—it simply *is* a fact."⁶

¹ The word 'faculty' is used here in place of Jung's own word 'function'.

² In this Jungian terminology, 'sensation' means an uncritical and unorganized apprehension of brute facts in isolation from one another.

³ A Catholic friend of the writer's comments: 'If we remember the story of Martha and Mary, we have there in simple form the two different kinds of soul: extravert and introvert. If we examine the first disciples, we find the various types.'

⁴ 'Sensory' is used here as the adjective corresponding to the substantive 'sensation' in Jung's meaning of this latter word.

⁵ See V. v. 282-4.

⁶ Wickes, op. cit., pp. 57-58.

This grouping of the faculties is the limiting factor in the articulation of the main psychological types into sub-types. For while the predominant faculty always has one auxiliary which is likewise on the level of Consciousness, so that the main types defined by predominant faculties fall into sub-types defined by their auxiliaries, it is not practically possible for the dominant faculty to associate with itself, as its auxiliary, every one of the three other faculties. It cannot enter into this relation with the sister faculty belonging to the same pair as itself (the discriminating rational or the perceptive irrational pair, as the case may be). This sister faculty is condemned, *ex officio affinitatis*, to be repressed into the Subconscious, because the Consciousness cannot serve two masters simultaneously, even when one of them is under the other's command, if they have an identical *modus operandi* but make use of it for incompatible purposes;¹ and for this reason the predominant faculty's choice of auxiliary faculties is confined to one between the two faculties of the opposite pair—either of which is a possible junior partner for the predominant faculty, because it operates in a different psychic style, so that there is no possibility of a clash between the two associates. This means that each main type is articulated in practice into only two sub-types and not into the mathematically conceivable three.

In the light of this summary exposition of the Jungian classification of psychological types we may perhaps tentatively draw the equations, set out on the accompanying table,² between types and religions.

In the classification by attitudes the four living higher religions seemed to range themselves clearly into an 'introvert' and an 'extravert' pair on the criterion of their respective readings of the nature of Ultimate Reality. In the eyes of the two religions of Indic origin, Hinduism and Buddhism, Ultimate Reality—the *Brahman* of the Hindu theology and the *Nirvāṇa* of the Buddhist—was impersonal and the approach to it was to be found by the conscious personality in turning inwards to remerge itself in the Subconscious. By contrast, in the eyes of the two religions of Judaic origin, Christianity and Islam, the Ultimate Reality was a Personal God, and the approach to Him was to be found by the human soul in turning outwards to enter into a communion with God which would prove to be, not a relinquishment of personality, but the human personality's *raison d'être* and consummation.

When we come to the classification by faculties we find that, unlike the classification by attitudes, it cuts across the grouping of the religions according to their historical origins, Indic and Judaic; for the rationally discriminating pair of faculties was represented by Hinduism and Christianity, and the irrationally perceptive pair by Islam and Buddhism. The predominant faculty in Hinduism was thinking; for its mainspring was a thought (inherited by Hinduism from the Indic school of philosophy) which was perhaps the most difficult that was conceivable for the Rational Human Intellect. This key-thought of Hinduism was the comprehension, by the Consciousness, of its psychic antithesis the Subconscious, and the realization that this subconscious underworld of the consciously individual soul was, not merely impersonal, but supra-

¹ This point is explained by Jung in op. cit., p. 515. ² Table VII, facing p. 772.

personal.¹ By contrast, the predominance in Christianity of the faculty of feeling was proclaimed in the three words 'God is Love',² which were the heart of the Christian revelation. The predominance in Islam of the faculty of 'sensation', in the Jungian meaning of an uncritical apprehension of matters of fact, was no less clearly displayed in the Islamic confession of faith—'There is no god but *the* God, and Muhammad is The Apostle of *the* God'—and in the Islamic commandments to observe the five hours of prayer and to make the pilgrimage to the Holy Cities of the Hijāz. The predominance in Buddhism of the faculty of intuition was intimated in the sudden flash of enlightenment in the soul of the Founder in which his way of salvation had first revealed itself and which the followers of the Zen school of the Mahāyāna strove to recapture. In that supreme moment of his vigil under the Bōdhi Tree, there had burst upon the Buddha's soul a perception that Desire is the fuel of Pain, and that the extinction of Desire is the means of self-release from the Sorrowful Wheel of Existence into a peace that passeth all understanding: the haven of *Nirvāna*.

To follow out our interpretation of the higher religions in terms of psychological types, we have also to consider the sub-types and to take note of the faculties that, in each type and sub-type, are not even taken into partnership with the predominant faculty as auxiliaries, but are repressed into the Subconscious.

In Hinduism one of the predominant thinking faculty's two auxiliaries was the faculty of sensation, which here found expression in ritual; and, since the stimulation of thought by sensation in the service of an 'introvert' religion was an elsewhere unfamiliar phenomenon,³ this combination of these two faculties with the 'introvert' attitude in Hinduism accounted for the impression—made on non-Hindu observers—of an incongruity between the etherially sophisticated conceptions of the Hindu theology and the crassly primitive rites that were practised by the esoterically instructed adepts as well as by the ignorant masses. The truth, no doubt, was that, for the Hindu adept, an external rite had an inner meaning that eluded the mental eye of the non-Hindu critic.

The other auxiliary faculty in Hinduism was intuition; and the partnership between intuition and thought in an 'introvert' religion had borne fruit in the psychological exercise and experience of Hindu mysticism (*yoga*). Mysticism and ritualism might appear to stand at opposite poles; yet, if this had been the gamut of Hinduism's spiritual capacity, it would still have been so inadequate a response to Man's

¹ In the language of the Indic school of philosophy this truth was conveyed in the proposition that the *Ātman* (Soul) was identical with *Brahman* (Ultimate Reality). If this proposition was to be taken, *au pied de la lettre*, as signifying a complete equation of 'God' with the 'Collective' Subconscious underlying the 'Personal' Subconscious that underlies the Conscious Personality (in terms of Jung's psychology), the Indic philosophers and their disciples the Hindu theologians had assuredly gone beyond the evidence, and, in the belief of the writer of this Study, their guess had also missed the mark on an issue which was the supreme question in the quest for religious truth. On this point see pp. 468-9 and 497-8, above.

² 1 John iv. 8 and 16.
³ The stimulation of thought by sensation in the service of an 'extrovert' and secular intellectual pursuit had, of course, been the driving force behind a Modern Western scientific activity.

spiritual needs that it never could have won and retained the allegiance of a quarter of the Human Race.

One crying need of Human Nature—which had been amply satisfied in Christianity, Islam, and the Mahayanian sub-type of Buddhism—is Man's craving for a personal God with whom he, as another personality, can establish a relation; and in Hinduism this universal and importunate human demand had been met by the worship of Vishnu in his innumerable avatars in human form.¹ In this 'extraverted' worship of the Ultimate Reality in personal epiphanies, Hinduism might be said to be making a concession to Human Nature at the price of doing some violence to its own genius, if its mainspring was correctly described as an 'introverted' intellectual comprehension of the impersonal underworld underlying a Human Consciousness. There were, however, other aspects of the worships of Vishnu and of Shiva in which they showed themselves true to Hindu type; for an unsophisticated Hindu could find 'sensational' satisfaction in the liturgies of the Shaiva and Vaishnava churches, while an esoterically instructed Hindu would understand that even the personalities of the Gods were 'in the last analysis' ephemeral and illusory phenomena, and that their significance lay in symbolizing in myriad guises an intuitively perceived rotation of the Wheel of Existence, in which *Maya* was ever arising out of *Brahman*, and ever sinking back into It again—like the misty exhalations which the Sun's lust is ever drawing up out of the Ocean in order ever to be letting them drop down again to Earth in the falling rain, to run back to the Ocean in the flowing rivers.²

Thus Hinduism, which was dedicated to 'introverted' thought, had widened the range of its psychological appeal by making the most of the partnership of Hindu thought with both sensation and intuition. The faculty for which Hinduism had found no recognized place was thought's incompatible sister, feeling. It was true that, inasmuch as no fundamental faculty of the Psyche can ever be completely and permanently banished, the faculty of feeling had forced its way up again from the subconscious on to the conscious level of Hindu religious life. In the worships of Shiva and Vishnu there was an emotional element in the personal relation between the worshipper and his God which, on the worshipper's side, took the form of personal devotion (*bhakti*)³ and on the God's side was expressed in his sexual passion for his female consort (*sakti*). This emotional element was manifestly akin to the feeling which was the leading note in Christianity and also in the Shi'i form of Islam and in the Mahayanian form of Buddhism,⁴ though,

¹ The two gods Vishnu and Shiva had been the product of a syncretism of a host of more or less like-natured local divinities, and the two syntheses in which the Hindu conception of *Brahman* in a personal epiphany had thus been polarized were readily reducible to unity on Hindu lines of thought, since creation and destruction are the two alternating beats of a single rhythm of phenomenal life. If the worshippers of Shiva and Vishnu had nevertheless been content to see their respective deities live and let live, they had been practising the tolerance which was characteristic of the Hindu religious ethos (see V. vi. 47-49, and the anecdote quoted from Radhakrishnan by Wight on p. 746, below).

² Compare Charon's simile in the passage of Lucian quoted in V. vi. 133.

³ See V. v. 135-8.

⁴ Read, for example, the *Tiruvāṇṇam* ('Sacred Utterance') of the Tamil poet, saint,

by comparison with these other expressions of it, some of its expressions in Hinduism looked crudely archaic to non-Hindu eyes and felt repulsively sensual to non-Hindu susceptibilities.

An apparent absence of love and absence of zeal for righteousness were the negative aspects of Hinduism that were apt to strike non-Hindu observers the most painfully.¹ They would recall the opening colloquy between Arjuna and Krishna in the *Bhagavadgītā*, in which, on a battlefield before battle is joined, the human hero confides to the god his heart-rending doubt whether Man can be justified, even in 'a good cause', in doing such evil as to fight and slay his fellow human beings; and they would be shocked by the coldness of Krishna's metaphysical solution for Arjuna's moral problem.

'Your words are wise, Arjuna, but your sorrow is for nothing. . . . That Reality which pervades the Universe is indestructible. No one has power to change the Changeless. Bodies are said to die, but That which possesses the body is eternal. It cannot be limited or destroyed. Therefore you must fight.

'Some say this Ātman
Is slain, and others
Call It the slayer:
They know nothing.
How can It slay
Or who shall slay It?'²

To non-Hindu observers, whose approach to Religion was not an essentially intellectual one, Krishna's academic exposition of the Sub-conscious as being the Ultimate Reality would seem so irrelevant to Arjuna's pressing practical problem of conduct that it might be suspect of being deliberately evasive,³ were it not notorious that Hindu minds

and sage Mānikka-Vācagar, which has been translated into English by G. U. Pope (Oxford 1900, University Press). An appreciation of the *Tiruvācagam* will be found in Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, pp. 215-19. 'It is not, like the Baghavad-Gītā, an exposition by the Deity, but an outpouring of the Soul to the Deity. . . . The remarkable feature . . . is the personal tie which connects the Soul with God. . . . Not only its outline but its details strikingly resemble the records of devout Christian lives in Europe.'

¹ See V. vi. 145-6 and 151-2.

² *Bhagavadgītā*, ii, English translation by Swami Prabhavananda and Christopher Isherwood (London 1947, Phoenix Press), pp. 40-41. The first sentence here quoted immediately precedes the last sentence quoted, from Barnett's English translation, in V. vi. 146.

³ A Hindu philosopher who was familiar with the Christian Gospels might perhaps aptly reply that Krishna's exposition was, not deliberately evasive, but deliberately shocking; that, in this point of psychological construction, it resembled the parables of the Importunate Widow, the Talents, the Unjust Steward, the Labourers in the Vineyard, and the Prodigal Son; and that the motive for presenting a lesson in this vein was the same in the Hindu genre of edifying religious literature as in the Christian genre: namely, the mystification of philistines on whom the lesson would be lost in any case in any presentation of it. Manifestly the parables above mentioned would be above the head of a catechumen who could see no more in the first and in the second than a comparison of God Almighty with an unjust human judge and with a hard employer; no more in the third than a recommendation to the faithful to enter into a conspiracy with their employers' debtors for defrauding their employers of their due; and no more in the fourth and the fifth than a penalization of industry and virtue in the interests of sloth and vice. These shocking features in these parables are so many traps to catch the philistine, because, while it is true that they are shocking, it is at the same time true that they are irrelevant to the point which it is the purpose of the parable to make. On

were utterly sincere in their belief that Man's spiritual nourishment was to be found in an intellectual stone and not in moral bread¹ (to give their Christian names to Hindu values). The non-Hindu reader of the *Bhagavadgītā* would suffer the same moral shock when he turned from the classic Hindu religious poem to gaze upon a visual presentation of Shiva dancing the rhythmic ebb and flow of the phenomenal aspect of the Cosmos. In one of these masterpieces of the Tamil bronze-caster's art the naïve non-Hindu spectator would marvel at the virtuosity with which the snake-like swarm of writhing arms and legs was weaving a pattern for which the whirling Wheel of Existence had provided a frame, till he would be horrified by noticing the contrast between the misery of the trampled human figure on whose back one gracefully dancing divine foot was poised,² and the unconcerned serenity of the divine countenance. If that bronze could speak, its utterance could be nothing but

'I am indifferent to all born things; there is none whom I hate, none whom I love.'³

When we pass from Hinduism to Christianity, we find that the here predominant feeling faculty's pair of auxiliaries is the same as the thinking faculty's pair in the Hindu *Weltanschauung*, and that, here again, the auxiliary faculty of sensation finds expression in ritual. In the congregational rite of the Eucharist the Christian worshipper achieved an experience of entering into communion with a God who was Love. This association, in Christianity, of the two faculties of feeling and sensation in the service of an 'extravert' religion accounted for the impression—made on non-Christian observers—of an incongruity between the etherially sublime feelings that united with his worshippers a God who had become man and had suffered death on the Cross, and the strangely primitive rite in which this communion was consummated. What had Christ to do with Tammuz, or Christ's body and blood with the corn and wine that were deified because they were the material food of *Homo Agricola*?⁴ The answer was that, in Christian hearts for whom God was Love, the ritual of a primitive food-god had become a vehicle for Christian feeling.

In Christianity, as in Hinduism, the other auxiliary faculty was the same lines a Hindu exegete of the *Bhagavadgītā* might submit that the undeniable shockingness of Krishna's solution for Arjuna's moral problem is irrelevant to the metaphysical truth which it is the purpose of the poem to expound.

¹ Matt. vii. 9; Luke xi. 11.

² "This theme . . . shows Siva, usually surrounded by a halo of flames, performing his dance of regeneration at Tillai, the mythical centre of the Universe. The demon he crushes beneath his feet symbolises Evil" (John Irwin in *Indian Art*, essays by H. G. Rawlinson, K. de B. Codrington, J. V. S. Wilkinson, and John Irwin, edited by Sir Richard Winstedt (London 1947, Faber), p. 102). I do not know whether this is the accepted interpretation or whether it is an etherializing gloss by an abashed Hindu theologian. If it is the right interpretation, then the figure of Siva Nataraja illustrates, not the predominant thinking faculty in Hinduism, but the faculty of feeling pushing its way up (see p. 726, above). I suppose the faculty of feeling is represented by the desire—which I do not think you mention in this Annex—for atonement, for redemption from sin, which is one of the basic religious impulses, if not the basic one.—Martin Wight.

³ *Bhagavadgītā*, ix. 29, Barnett's translation, quoted in V. vi. 146.

⁴ A partial answer to this vexed question has been attempted on pp. 457 and 494, above.

intuition; and, in Christianity likewise, the partnership of intuition with the predominant faculty had borne fruit in mysticism—though in an ‘extravert’ religion for whose followers the Ultimate Reality was a Personal God the mystic’s goal had been a Beatific Vision in which the human party to the encounter would retain the personality without which he would be unable to glory in God—in contrast to the Hindu mystic’s goal of a Beatific Union in which the personality would be merged in an impersonal reality transcending it.¹ Yet neither the ‘extravert’ mystical nor the ‘extravert’ sacramental way of communion adequately met the spiritual needs of ‘introverted’ Christian souls; and, in psychological terms, this explained why the Protestant movement in a Western Christian Church had parted company with the Western Catholics as well as with their Eastern Orthodox co-religionists on the issue of the method and mode of communion between God and Man.

In the Jungian terminology, Protestantism was an attempt to provide, within a Christian framework, for the psychological needs of ‘feeling introverts’ by doing some violence to the genius of a religion which, in its classic form, appealed specifically to ‘feeling extraverts’. In the Protestant’s experience the real presence of Christ was to be found neither in the Beatific Vision nor in the rite of the Eucharist, but in the overwhelming spiritual event of a sudden ineffable change in the Christian’s heart which certified its own authenticity by carrying with it a conviction that the sinner was saved. Yet even this *tour de force* of leading a Protestant canal out of the river of Catholic and Orthodox Christian tradition had not availed to bring the living waters of Christianity within the reach of every soul that was athirst. Introversion could never be complete in a religion for which the Ultimate Reality was a personal God; and the Protestantism that had succeeded in giving a limited expression to the ‘introvert’ attitude was as much at a loss as every other form of Christianity in its dealings with the faculty of thought. A Hindu observer of Christianity could hardly fail to be struck by the repression here of a thinking faculty which in Hinduism was dominant; and the Hindu critic would not be much impressed when, in reply, the Christian apologist pointed to an historic chain of mighty Christian thinkers extending from the author of the Fourth Gospel to Saint Thomas Aquinas.

‘It is true’, our Hindu would retort, ‘that, when you drive Nature out with a pitch-fork she will insist on coming back sooner or later.’² You have already suggested to me that the feeling faculty, which is repressed in Hinduism, has reasserted itself in the archaic form in which it presents itself in *bhakti*; and I readily concede that in Christianity the repressed faculty of thinking has re-asserted itself likewise. Considering that the earliest Christian mission-field happened to be the domain of an Hellenic Society which was almost as intellectual as its Indic contemporary, and further considering how prone you Hellenistic Westerners

¹ This distinction between the respective goals of mysticism in the ‘extravert’ and the ‘introvert’ philosophies and religions has been touched upon by anticipation in V. vi. 143, n. 3, and on p. 429, above.

² ‘Naturam expelles furcâ, tamen usque recurret.’ (Horace: *Epistulae*, Book I, Ep. x. l. 24).

and Byzantines have been to fall under the spell of an ancestral Hellenic mode of thought, what else could Christian Evangelists and Christian Fathers do but make an attempt at translating the Christian mythology into the language of the Hellenic school of philosophy? I am not surprised at the attempt, but I am also not impressed by the achievement. In the great Gothic cathedral, of which your Christian *Weltanschauung* reminds me, a re-intruding Intellect has advertised its presence in the ingeniously intricate tracery of the windows and in the gorgeously coloured glass; but the tracery does not fulfil any architectural function; if the whole of it were removed, the roof and the tower would still rest securely, as now, on the massive masonry of irrational walls and columns; and, as for the stained glass, if you were to remove that too, why, you would be letting in the sunshine in all its glory to put to shame the 'dim religious light'¹ now cast by the few discreetly selected rays which the glass admits—and tones down in their transit.

'To drop parables and use plain language', our Hindu exegete might proceed, 'I feel little respect for the Christian application of thought to Christianity because your Christian thinkers do not dare to have the courage of their convictions. The characteristic virtue of thought is to follow the argument whithersoever it may lead; if thought flinches from fulfilling this first commandment of intellectual honesty, it commits a stultifying sin against its own nature; and this is the moral infirmity by which your Christian thinking is invalidated. Your imposing *Summa Theologiae* is confined within the prison-walls of a mythology which your hearts have dictated to your heads; and in matters of religion Christianity allows the Intellect to operate only under a perpetual edict serving notice "Thus far and no farther". What is the World to think of a Christian intelligence that consents to work under conditions that make nonsense of the Intellect's essential function? Your Christian moral sensibilities are excruciated, you say, in the *Bhagavadgītā*, by Sri Krishna's intellectual liquidation of Arjuna's moral scruples. But is not the ruthless trenchancy of the poem's reasoning, which to you is repugnant, the best evidence of its intellectual integrity? If you are morally shocked by Krishna, I am intellectually unconvinced by Aquinas; and I am proud—however high your Christian judgement may rate the moral price—that my Hinduism does not sacrifice honest thinking to prejudiced sentiment.'

This mutual misunderstanding between two higher religions in which the thinking faculty and the feeling faculty were respectively predominant was perhaps inevitable on the showing of the Jungian psychology. These two 'rational' faculties were at odds with one another because they were using the same discriminatory *modus operandi* at cross-purposes. To conclude our inquiry we have still to review the two other higher religions, in which the 'irrational' perceptive faculties, sensation and intuition, were predominant, and in which thinking and feeling were auxiliary.

In Islam, in which the predominant faculty was an apprehension of matters of fact which Jung had labelled 'sensation', the thinking faculty

¹ Milton: *Il Penseroso*.

had played a more responsible part than in Christianity—not in the sense that Islamic theologians could be held to have surpassed their Christian confrères in intellectual prowess, but because in Islam the Intellect had enjoyed the advantage of doing its work as a junior partner of the predominant faculty and not as an unauthorized intruder. In building the Founder's modest legacy of isolated and unorganized tenets and commandments into the vast and solid structure of the *Shari'ah*, the Sunnī theologians had, it is true, laboured under the same restrictive building regulations as their Christian brother masons. They had been constrained to make use of the materials handed out to them, and to take these materials as they had found them, however inappropriate these might have been for use in an intellectual structure. But they had profited by the paucity of the *disjecta membra* that they had inherited from the Prophet—like the architects of the Ka'bah, who had had a free hand to build all the rest of their fane in whatever material and whatever style might suit them best, so long as they duly embedded in it, undesecrated by the chisel, one single uncouth but sacrosanct Black Stone, whereas the Christian theologians, under instructions to elicit a law of logic out of the law of Love, might be likened on our analogy to builders who had found themselves furnished with the fruit of the Tree of Life in quantities sufficient for building a Tower of Babel if only fruit-pulp were a practicable building material.

While the Sunnī *Shari'ah* was a monument of the thinking faculty's service as an auxiliary to the matter-of-fact sensory faculty in Islam, the feeling faculty, which here had been the other auxiliary, had expressed itself in the Shi'ah—'the sect' *par excellence*, which had broken away from the Sunnah in order to minister to an elemental human need that the Sunnah could not satisfy.

Though orthodox Islam shared with Christianity the 'extravert' vision of Ultimate Reality as a personal God, the significant aspect of the divine personality was not the same in the sight of the two religions. If a Sunnī Muslim were called upon to describe God in three words, he would be constrained to write, not 'God is Love', but 'God is Power'. But this hard fact of God's power is no satisfying substitute for the warm feeling of God's love; and, if the eruption of Islam in reaction to Christianity was evidence that God's aspect as Power could not be depreciated with impunity, the break-away of the Shi'ah from the Sunnah within the bosom of Islam was an illustration of the nemesis incurred by depreciating God's aspect as Love. The portrait of the One True God that had been painted by Muhammad belied the conventional epithets that had followed His name into the Qur'ān like echoes from the New Testament and from the Prophets of Judah and Israel. The God to whose love Muhammad had paid lip-service by calling him 'the Merciful, the Compassionate' (*ar-Rahmān, ar-Rahīm*) had been depicted by Him as aloof and arbitrary and vindictive; and accordingly Muslim hearts that had been athirst for Love had found in an intimately human 'Alī what they had been unable to find in an inhumanly transcendent Allah.

For Shi'is, 'Alī had the pathos of the incarnate saviour who 'came unto

his own, and his own received him not';¹ and the Passion of 'Alī's martyred son Husayn was annually commemorated in the Shī'ī World with an emotion that reminded a Christian spectator of the traditional Christian feeling about the Passion of Christ. Indeed, as we have seen,² there were Shī'ī extremists who, in their unavowed esoteric doctrine, identified 'Alī with God and ascribed the same divinity to his physical descendants the Imāms;³ and these outright 'Alī-worshippers would have no consciousness of blasphemy in applying to their God Incarnate the context of the verse from the Gospel according to Saint John that we have quoted above as expressing the feelings of the more moderate followers of the Shī'ah. The extremists would assert of 'Alī that 'the World was made by Him',⁴ and they would arrogate to themselves the daring claim that, 'as many as received Him, to them gave He power to become the sons of God, even to them that believe on His name'.⁵

Yet, while the Shī'ah offered the Muslim an intimate instead of a forbidding epiphany of a personal God, both sects of Islam would have repressed the faculty of intuition and the attitude of 'introversion' if these two ubiquitous elements in 'the make-up' of the Human Psyche had not risen in revolt and forced their way back into the conscious life of Islam, in defiance of a system in which there was no acknowledged room for them. 'Islamic mysticism', like 'Christian philosophy', was virtually a *contradictio in adjecto*. Yet, just as the Religion of Love had managed to find a place for a magnificent intellectual construction that had no organic function in the Christian scheme of things, so the Religion of Matter of Fact had contrived to harbour a school of mysticism which could bear comparison with its Christian counterpart—though no doubt, in both Hindu and Mahayanian eyes, this Christian and Islamic *yoga* would seem to be all but stultified by an apparently wilful refusal to see through a Judaic hallucination (as the Beatific Vision would seem to be in Indic eyes) of a personal God masquerading as the Ultimate Reality.

In Buddhism the same two sister discriminatory faculties that served as alternative auxiliaries in Islam had lent their services to a predominant perceptive faculty which in this case was not sensation but intuition. The thinking faculty co-operated with intuition in the Hīnayāna, and the feeling faculty in the Mahāyāna. The Hīnayāna was a school of practical philosophy, in which the Buddha's intuition that conscious life is pain, and that therefore pain cannot be cured except by extinguishing conscious life, had been followed up by thinking out an uncompromisingly ascetic course of self-mortification for bringing the adept to his goal of *Nirvāṇa*. In the Mahāyāna the alternative auxiliary faculty of feeling had entered into a paradoxical partnership with the Buddha's master-intuition that Desire is the root of all evil and that the last enemy that shall be destroyed is, not Death, but Life.⁶

¹ John i. 11.

² On p. 718, above.

³ This combination of the two concepts of Incarnation and Metempsychosis seemed as alien from the Judaistic *Weltanschauung* of Islam as it was native to the Indic *Weltanschauung* of Hinduism and Buddhism. It was reminiscent of the avatars of Vishnu and of the Buddha in his Mahayanian metamorphosis.

⁴ John i. 10.

⁵ John i. 12.

⁶ 1 Cor. xv. 26.

The Mahayanian Buddhist had substituted for the arhat, whom his Hinayanian co-religionist revered and followed as his guide towards his goal of *Nirvāna*, a bodhisattva who deserved and received the Mahayanian Buddhist's love because the bodhisattva had 'so loved the World'¹ that, though he had already won his own way to the goal of human endeavours and was free to enter into his rest,² he had deliberately made the sacrifice of postponing his self-extinction for an indefinite time to come, in order that whosoever believeth in him³ should learn from him how to follow in his footsteps. On these lines the alchemy of Love had transmuted a negative fellowship, in which the arhat followed the Buddha's lead towards the goal of *Nirvāna*, into a positive fellowship in which the faithful—including the mundane masses as well as a cloistered *élite*—could look forward to being with their bodhisattva in Paradise.⁴ In theory, Amitabha's Paradise was a transient experience, like Christ's Millennium in the Christian eschatology; and, considering that *Nirvāna* was still the official goal of the bodhisattva and his followers alike, and this on the strength of the Buddha's key-intuition that life is pain, it was difficult for an outsider to understand how this paradise could be a paradise at all, and not rather a purgatory. The outsider could only register the fact that, for Mahayanian Buddhist hearts, the Mahayanian Paradise was a virtual equivalent of the Christian Heaven.

An 'introverted' intuitive religion might thus paradoxically accommodate Love, but it could give no official scope for 'extraversion' and no official value to matter of fact. Yet in Buddhism, as in the other living higher religions, Human Nature had rebelliously asserted its need to find some vent for all its divers faculties and attitudes. 'Extraversion' requires a manifestation of Ultimate Reality in a personal form; the sensory faculty requires a tangible object to apprehend (the Black Stone, the wood of the True Cross, the blood of Saint Januarius); and the Primitive Buddhist Community lost no time in providing for both these requirements. The breath was hardly out of the Buddha's body before his disciples were disputing over the possession of his mortal remains with a view to treasuring as sacred relics these material *débris* of a soul that had successfully remerged itself in *Nirvāna*; and the thus beatified human founder of the Buddhist Community had been transfigured by Hinayanian piety into a superhuman being long before the historical personality of Siddhārtha Gautama, the Sakya prince of the sub-Himalayan city-state of Kapilavastu, had been eclipsed, in the Mahayanian imagination, by other avatars, past and future, of an ever-recurrent Buddha, which better satisfied the human need for an epiphany of a personal God because they were untrammelled by intractable historical associations.

In the Mahayanian apotheosis of the Bodhisattva Amitabha, as in the Shi'ite apotheosis of the Caliph 'Alī, an *anima naturaliter Christiana in partibus peregrinis* was offered an equivalent of the Second Person of the Christian Trinity, while a metamorphosis of the Bodhisattva Avalokita into the Goddess of Mercy, Kwanyin, had provided the Far

Eastern moiety of Mankind with the spiritual consolation which, in the other half of the Old World, had been offered by the Great Mother in her divers avatars. Moreover, these very gods that had been discovered by, or revealed to, the Mahayanian Church were worshipped by her in liturgies that resembled those of Orthodox and Catholic Christianity with a verisimilitude that startled the Early Modern Western Christian missionaries.¹

Our psychological interpretation of the four living higher religions, cursory and superficial though it has been, perhaps warrants us in drawing conclusions that may be summarized as follows. In the Human Psyche there are divers faculties and attitudes that are, all alike, importunate in seeking vent. These are all to be found in every individual human being, but this in different combinations and different relative strengths which display themselves in a variety of psychological types. There is not, and cannot be, any psychological type in which all the psychological elements can have full play at the conscious level; in every type there are, and are bound to be, some elements that are repressed into the Subconscious, and in every type the repressed elements seize, and are bound to seize, every opportunity of flooding back, unbidden, into Consciousness. These psychic phenomena prove to have been reflected in Religion. Each of the living higher religions, and each of their principal sects, had been attuned to some particular psychological type or sub-type;² and each religion was ever seeking, like the psychological type which it served, to achieve the impossible feat of ministering to the whole gamut of the Psyche's elemental needs for expression. The feat was impossible because there was not, and could not be, any spiritual organ capable of playing a psychic diapason; and therefore any existing higher religion that aspired to become *the* Universal Religion was doomed to disappointment, while any that claimed already to be *the* Universal Religion must be unaware of its own intrinsic limitations. The heavenly music that would satisfy every need of the Soul was not inaudible on Earth, but it was never audible in a solo; it could be heard only in a symphony. The divers higher religions must resign themselves to playing limited parts, and must school themselves to playing these parts in harmony, in order, between them, to fulfil their common purpose of enabling every human being of every psychological type to enter into communion with God the Ultimate Reality.

¹ See p. 460, n. 1, above, for the two alternative traditional Christian explanations of this likeness.

² A Catholic friend of the writer's comments: 'Should the Christian Faith really penetrate into the East, I am confident that aspects of it which are almost dormant in the West will flourish exceedingly. Let us suppose that the other three higher religions had not arisen, and that the Christian message had reached the East: I presume that the human beings there, being, as they are, of a different stamp to the extraverted Westerners, would have received the message *secundum modum recipientis*. They would have stressed some elements which remain almost unstressed in the West. This is even evident in the two approaches to Christian doctrine followed respectively by the Catholic and by the Orthodox Church, the one tending more to devotion through the humanity of Christ, the other more to devotion through the wisdom of God. I think it is a matter of more and less, not of [an exclusive choice between] either the one thing or the other.'

This conclusion that none of the living higher religions was superfluous left open the question of their relative value. 'One star differeth from another star in glory.'¹ An orchestra would not be capable of playing a symphony at all if there were not a conductor and a first violin. In the orchestra of Religion, does one psychic faculty count for more than another? Our answer to this question will be determined by our view of the nature and destiny of Man. If the true end of Man is to glorify God and fully to enjoy Him for ever, Man's master-faculty must be the one through which God is accessible to him, and this inestimably precious conductive faculty is not the Intellect, which is the distinctive organ of *Homo Sapiens*. Man enters into communion with God through the faculty of feeling which *Homo Peccator sed Capax Dei* shares with other living creatures. On this showing, the most valuable instruments in the orchestra of Religion would be those that played the music of Love; and, on an order of merit determined by that criterion, Christianity would head the list because, in Christianity, feeling was the predominant faculty, while the Shi'ah and the Mahāyāna would be next to Christianity in glory because, in each of them, feeling was the predominant faculty's auxiliary.

On this finding, Hinduism would stand at the bottom of our list; and the non-Hindu critic might even go so far as to suggest that the Intellect, which is at a discount when it is 'introverted' for service as the predominant faculty in a higher religion, is more profitably employed when it is 'extraverted' for secular purposes. Let the Intellect occupy itself in begetting Science, which is generated by a union of 'extraverted' thought with the faculty that apprehends matters of fact, and in begetting Philosophy, which is generated by a union of 'extraverted' thought with intuition. Yet it would be open to Hinduism to retort that, when she was weighed in the balance and found wanting² by a unanimous verdict of Christianity, the Shi'ah and the Mahāyāna, the judgement must be held to be invalidated by the patent intellectual incompetence and emotional prejudice of this self-constituted jury. What, for instance, would the Sunnah and the Hīnayāna have to say? And does the last word lie with a living God or with a brooding Brahman?

Meanwhile, at the time of writing, midway through the twentieth century of the Christian Era, Hinduism was to be found, not at the rear of the procession of living higher religions, but in its van, in virtue of a characteristically Hindu spirit of spontaneous charity towards all revelations—past, present, and to come—which was the first spiritual requirement in an age in which the whole of Mankind had been united in a single Great Society through 'the annihilation of distance' by a Western technology.

'In a restless and disordered world which is unbelieving to an extent which we have all too little realised, where sinister superstitions are setting forth their rival claims to the allegiance of men, we cannot afford to waver in our determination that the whole of Humanity shall remain a united people, where Muslim and Christian, Buddhist and Hindu shall stand together bound by a common devotion not to something

¹ 1 Cor. xv. 41.

² Dan. v. 27.

behind but to something ahead, not to a racial past or a geographical unit, but to a great dream of a world society with a universal religion of which the historical faiths are but branches. We must recognise humbly the partial and defective character of our isolated traditions, and seek their source in the generic tradition from which they all have sprung. . . . In their wide environment, religions are assisting each other to find their own souls and grow to their full stature. . . . We are slowly realising that believers with different opinions and convictions are necessary to each other to work out the larger synthesis which alone can give the spiritual basis to a world brought together into intimate oneness by Man's mechanical ingenuity.¹

THE CRUX FOR AN HISTORIAN BROUGHT UP IN THE CHRISTIAN TRADITION

By MARTIN WIGHT

THE Christian critic will read the whole of this Part with sympathy and admiration, above all for the comprehensive charity with which you endeavour to see all the Higher Religions *sub specie aeternitatis*.¹ But he may well have misgivings about your main arguments, and believe that you do not maintain the full tension inherent in the Christian problem of comparative religion. It is convenient to sum up some criticisms at this point.

1. Your description of Christianity is philosophical rather than historico-theological, 'Hellenic' rather than 'Hebraic'. You define Christianity in terms of the assertion that 'God is Love',² or as 'unique in revealing God to Man as Man's father and brother'.³ But this is only true as far as it goes, and it does not go far enough. The central declaration of Christianity is not that God *is* something, but that God *has done* something; it is Hebraic first and Hellenic second; its uniqueness is primarily historico-theological, and only consequentially theologico-philosophical. God *has done* something in history; He has acted *in history* to show the meaning of history. If the Gospels say anything, they say this; and, since it is the common theme of the Synoptics and of St. John, perhaps the greatest modern Anglican commentary on St. John's Gospel may be quoted on the point:

'Modern study of the Fourth Gospel has pressed upon the Church the problem of historicity; the author of the Fourth Gospel, however, with greater theological insight, presses upon his readers the far more important, far more disturbing, problem of History itself and of its meaning. Confronted by the flesh of Jesus, the son of man, he demands that men should remember what He had said (xiv. 26), nay more, that they should eat His flesh and drink His blood (vi. 52-6). Jesus—Son of Man—words—flesh—blood! It is difficult to imagine language that fixes attention more steadily upon the importance of History. But, with equal conviction, the Evangelist refuses to permit his readers to rest even upon this important and particular history. *It is the spirit that quickeneth, the flesh profiteth nothing*. Only in relation to Spirit and Truth are the words of Jesus significant (vi. 63); only in relation to His Word is this speech able to be understood (viii. 43). It therefore follows necessarily that His words, His actual words, require for their understanding the interpretation that the Spirit of Truth alone is able to provide (xiv. 26). In Himself, as a product of the evolution of history, the Son of Man is merely—a son of man (viii. 54); and His words and actions, if they be thought of merely

¹ On p. 428, above.

² e.g. on pp. 439 and 443, and in VII. A (iii) (a), Annex II, 'Higher Religions and Psychological Types', p. 725, above.

³ On p. 427, above.

as historical episodes, are trivial and meaningless (vii. 16-18). This is the witness of the author of the Fourth Gospel: a witness thrust like a dagger straight into the heart of the "World" in so far as the World is regarded as existing of itself and in its own right; plunged like a dagger into the heart of History, if History contains within itself its own evident, analysable, and describable meaning. . . .

"The modern reader must by an effort of historical imagination first endeavour to place himself in the position of those for whom the gospel was originally written. Only he must not rest until this position is found to be charged with universal significance, until he stands here naturally because it is his inevitable position as a man. He must not rest until he stands where the Jews once stood and did not apprehend, and where Abraham and Isaiah once stood and did apprehend; until he stands confronted, not by the evolution of History, not even by the development of the Church, but by the Last Hour; until, that is to say, he stands confronted by the Truth, until the present time is confronted by eternity, and until the present place is met by the meaning of History—in fact, until he stands before God."¹

The Christian reader misses, in your account of Christianity, this insistence upon its springing from a unique and particular historical event which is charged with eschatological significance, and upon its therefore providing, alone among the Higher Religions except Islam, and far more fully than Islam, an answer to the question of the meaning of History.

2. It follows upon this that the Christian critic may think that you misrepresent the relationship between Christianity and Judaism, and consequently misrepresent Judaism itself. (a) Christianity did not 'break decisively with Judaism by recognizing and proclaiming that God is Love',² but by declaring that the promise of that Love, already contained in Judaism, was now fulfilled. 'L'abîme qu'il y a entre l'Ancien et le Nouveau Testament, c'est l'abîme qu'il y a entre l'annonce de quelque chose et la réalité de cette chose.'³ It is curious to see you, side by side with your sympathetic treatment of Abraham, Moses, and the Prophets as the Judaic *praeparatio evangelica*, consistently identifying Judaism with Yahweh-religion, and emphasizing the Judaic God's jealousy⁴ and 'Power.'⁵ As regards the primitive religion of Yahweh, moreover, surely its important feature is not its inferiority in relation to Judaism and Christianity, but its superiority to the de-based Canaanitish religions by which it was surrounded; not that it was only a partial revelation of the True God, but that it was indeed His revelation of Himself to the unpromising and backsliding people that he had chosen for His purposes. (b) Similarly, while Christianity did not 'break decisively' with Judaism in apprehending that God is Love, neither did it 'break decisively' in abandoning the apprehension that God is jealous—which simply means that His love makes exclusive

claims. As there is more love in the Jewish conception of God than you allow, so is there more jealousy in the Christian conception. When you speak of the 'readmittance of the incongruous Israelitish concept' of a jealous God into Christianity,¹ and even of 'a fourteen-hundred-years-long' perversion of Christianity by the same concept,² though this again appears to be contradicted or corrected,³ you are misrepresenting the Christian doctrine of God. For God's love is not a mere benevolence: it is a love that is identical with Holiness and Justice. This of course involves the human mind in paradox and great intellectual tension. It is only necessary here to point out that Jesus spoke of a God Whose response to obdurate evil is not only long-suffering but is also very terrible, and that the concept of the Wrath of God runs right through the New Testament.⁴ Indeed the Love of God as it is shown throughout the Bible, for here there is no disagreement between the Old Testament and the New, is not an undemanding benignity, but something perhaps more like the condition of 'being in love'—a love that makes exclusive claims upon its object. 'O Jerusalem, Jerusalem, thou that killest the prophets, and stonest them which are sent unto thee, how often would I have gathered thy children together, even as a hen gathereth her chickens under her wings, and ye would not.'⁵ 'No man cometh unto the Father, but by me.'⁶ 'Neither is there salvation in any other; for there is none other name under heaven given among men, whereby we must be saved.'⁷ The description of Christianity is falsified if this intrinsic exclusiveness and 'jealousy' in it is slurred over. (c) Where Christianity does seem to 'break decisively' with Judaism is not in its proclamation of Love, nor in its exclusiveness, but in its universality. It was not simply, as you say,⁸ 'an intervention of God Himself to redeem the Jews of Jesus' day'. In the Synoptic tradition no less than in John there is a clear refusal to limit the sphere of the call of God.⁹ The Old Israel which was limited to the seed of Abraham is superseded by the New Israel which embraces all who will repent and believe: the nature of the Christian Revelation is such that its promise and its claims are universal. But here again the discontinuity with Judaism is only superficial, for Judaism, inasmuch as it was an abortive Higher Religion, was also potentially universalist, and the Prophets had foretold the bringing of God's salvation to the Gentiles.¹⁰

3. The apparent under-estimation of the exclusiveness and universality of Christianity (the Christian critic might continue) throws your comparison of Christianity with the other Higher Religions out of focus. The inquiry necessarily begins from the assumption of the comparability of the Higher Religions, but the assumption is not sufficiently re-examined in the course of the discussion. It is only in the last two paragraphs of the Annex 'Higher Religions and Psychological

'Types' that there are signs that you might want to discard it. Thus you seem to exaggerate the similarity of the Higher Religions' aims and contents: to exaggerate the unity of the species at the expense of the differences between its representatives. At the outset you attribute to all of them the same kind of exclusive claims,¹ though later you admit that the two Indic religions are not exclusive, or are 'exclusive' in a quite different way;² nor do you distinguish with any consistency between the prophetic or Judaic religions on the one hand and the non-prophetic or Indic on the other,³ though the distinction is implicitly made in VII. A (iii) (b), on p. 453, n. 2. The reader may well feel that the comparative study of the Higher Religions never gets under way. Is there not a fundamental difference between the two Higher Religions of the Indic tradition, which are pantheistic, immanentist, non-historical, world-denying, and the two Higher Religions of the Judaic tradition, which are prophetic, transcendentalist, historical, and world-affirming?

But there is a methodological criticism that perhaps goes deeper. Your limitation of the discussion to the four Higher Religions that at present partition the World between them is really as arbitrary as it would be to limit your comparison of civilizations to the contemporary representatives of the species. It hinders your attempt to see the existing Higher Religions *sub specie aeternitatis*, because it commits you to assuming a finality about them which, in view of the many potential or abortive Higher Religions which have come into being in the past and either died or survived only as fossils, is manifestly illusory. There is no reason *a priori* to suppose that the 'fully-fledged Higher Religions . . . derived from the secondary civilizations'⁴ are the collective final term in the history of Religion. Nor is any evidence or argument produced for your assertion that it is their 'destiny . . . that they should all become world-wide without conflicting with one another'⁵ except for the theory that they correspond to Jung's psychological types; and this (fascinating, illuminating, and important as it is) cannot be more than a 'rationalization' of a particular historical constellation.

The 'illusion of finality' is most apparent when you argue⁶ that 'if these religions did not genuinely satisfy some widely experienced human need' it is hardly conceivable that they should each have secured so wide an allegiance. This assumes, first, that the apprehension of human spiritual needs remains constant, and secondly, that the means of satisfying them are all equivalent, whereas the history of Religion shows that the apprehension of spiritual needs undergoes progressive development, and adherence to any one of the Higher Religions implicitly denies the adequacy of the means of satisfying those needs which are offered by the Primitive Religions. Your argument that prevalence indicates value could have been used in the Roman Empire to show the superiority of Paganism to Christianity, as you yourself suggest when you say in another connexion that the contemporary observer is 'most unlikely to be able to foresee the spiritual shape of things to come'.⁷ Was Jung's

typology applicable within the Roman Empire under the Antonines? If not, then his types do not have permanent validity. If yes, then the contemporary division of the World between the four existing Higher Religions does not have permanent validity. Indeed, it is surely plain that the present constellation of Higher Religions is due not to psychological typology but to that much wider thing (in which psychological typology may play its part) which we can only call cultural history. The psychological theory could only be upheld if it could be shown that there is a numerical predominance of each psychological type in the region of the World where its 'corresponding' Higher Religion has the ascendancy, and for this there is no evidence whatever. It is just as likely that the Higher Religions mould psychology as that 'each of them may correspond and minister to one of the psychological types into which Human Nature appears to be differentiated',¹ or, in a word, as that psychology determines the Higher Religions.

4. You admit the concept of a *praeparatio evangelica* throughout in your interpretation of Judaism, and in your account of Paganism,² though you only use the phrase itself twice, I think, *en passant*.³ But from the Christian point of view it is the fundamental principle for explaining the relationship between Christianity and other religions, and for reconciling their truths and insight with the exclusive claims of the Christian Revelation, and the Christian critic may wish that you had developed it more thoroughly. It is expressed in the quotation from Temple,⁴ and it could be expressed in the very fine metaphor of the veils which you use in a different connexion.⁵ (It is magnificently stated in the passage from Bevan's *Jerusalem under the High Priests* which you quote in V. vi. 132: a passage which not only states the purpose and scope of the *praeparatio*, but also emphasizes the uniqueness and transcendence of That which was prepared for). The *praeparatio evangelica* was recognized from the earliest days of the Church, especially by St. Paul, when he preached at Athens,⁶ and in his acknowledgement of the validity of Natural Law among the Gentiles.⁷ In the second century A.D. the conception was elaborated, first of all, of course, to explain the relations between Christianity and Judaism, by St. Irenaeus in answer to Marcion, but also, more tentatively, to explain the relations between Christianity and Paganism, by St. Justin and Clement of Alexandria. 'Nous trouvons chez ces deux hommes l'idée que, dans les philosophies païennes, il y a une certaine présence du Verbe, du *Logos*, une certaine lumière divine qui éclaire les hommes et leur communique la part de vérité qu'il y a en eux.'⁸ Perhaps this French writer whom I have quoted, a Jesuit who besides being a Patristic scholar is profoundly concerned with the theology of missionary activity, may be quoted

further for a modern liberal Catholic statement of the conception of the *praeparatio evangelica* as the Christian doctrine of comparative religion:

'Il est très frappant de voir que les premiers chrétiens se sont trouvés, vis-à-vis du monde dans lequel ils étaient, exactement dans la situation dans laquelle se trouvent nos missionnaires en pays païens: une petite minorité d'hommes apportant un message étranger dans un monde qui leur était totalement fermé et hostile. Par exemple quand saint Paul pour la première fois est allé à Athènes et a commencé à prêcher l'Évangile sur l'Aréopage, il se trouvait dans la même situation que les premiers missionnaires qui sont allés en Chine ou au Japon et qui ont parlé aux sages de là-bas. . . .

'L'angoisse qui oppresse certaines âmes aujourd'hui, consiste à se demander si le christianisme n'est pas dépassé, s'il n'est pas vieilli. Ceci ne concerne que certaines structures tout extérieures du christianisme, mais non son essence: le christianisme est, et restera toujours, jeunesse du monde, parce qu'il est précisément chronologiquement au terme du développement de l'Histoire. Et la vraie relation du christianisme avec toutes les autres religions, c'est justement que ces religions à son égard sont antérieures, sont périmées. Je ne dis pas qu'elles sont fausses en tous points: le judaïsme n'est pas faux, le bouddhisme n'est pas faux, les civilisations fétichistes ne sont pas fausses; elles sont vieilles, c'est-à-dire que, par rapport au christianisme, elles sont dans un état d'antériorité chronologique et, en quelque sorte, des survivances; le christianisme, qui les achève, est apparu et désormais tout ce qu'il y a de bon en elles est accompli dans le christianisme. Entre le christianisme et elles, nous avons la juxtaposition dans l'espace de choses qui sont historiquement successives et c'est un fait curieux que ce rapport de simultanéité entre des réalités entre lesquelles le rapport essentiel est un rapport de succession.'¹

I think the Christian critic might point to two places where your emphasis is different, and implies the spiritual equivalence of the four Higher Religions rather than the *praeparatio evangelica*. You describe Matteo Ricci as having sought 'a reconciliation, on Christian initiative, between hitherto exclusive-minded religions'.² But the above passage from Daniélou is the authentic position of Matteo Ricci, who 'approached these alien faiths with sympathy, understanding and reverence', not because he thought that they were as good as Christianity, but because he saw them in the way in which St. Paul saw the Law, as 'our school-master to bring us unto Christ'.³ Christian charity will always enjoin respect for the genuine agnosticism of a Symmachus,⁴ but belief in the Christian Revelation is not compatible with an acceptance of Symmachus's position, and, although you infer the contrary, there would surely be no difference between St. Ambrose and Father Ricci on that point. Again, the resemblance between the sacraments and rituals of Christianity and Paganism cannot be adequately described for the Christian by 'the simple truth that it is a family likeness',⁵ which once more implies spiritual equivalence.

'Ce que nous rencontrons là, c'est cette espèce de sacramentalisme universel qui est à la fois une sorte d'intuition profonde du sens sacré des

¹ Daniélou, op. cit., pp. 10 and 21-22.

³ Gal. iii. 24.

⁴ p. 442, above.

² p. 441, above.

⁵ p. 459, above.

choses et en même temps qui ne donne pas la grâce, qui la signifie seulement. C'est une sorte de pierre d'attente, d'appel. . . . Que fera le christianisme? Créera-t-il des rites distincts de ceux des autres religions? Pas du tout. Le christianisme prendra tous ces gestes sacrés de toutes les religions, mais il les chargera de la grâce du Christ. Alors cette eau du Gange, dans la mesure où elle devient le baptême, devient le moyen de la régénération surnaturelle des hommes. C'est bien le même repas, mais ce pain qui aura été brisé n'est pas seulement un symbole, effectivement il nous fait communier à la réalité même de Jésus-Christ. Alors nous voyons très bien ce qui se ressemble et ce qui est différent. C'est presque pareil et c'est totalement différent. C'est pareil quant au geste mais c'est différent parce qu'il y a toute la différence entre la figure et la réalité, entre le geste qui est un geste d'attente et le don. Et c'est là l'essentiel du christianisme: le don par Dieu de la grâce divine et de la vie divine.¹

5. But there has always been a tension in the relationship of Christianity with other religions: a tension between apprehending them as a *praeparatio evangelica* and apprehending them as obstacles to the spreading of the Gospel. This tension reflects the inherent ambiguity of other religions, which are at the same time both 'precursors' and 'adversaries'; and it springs from the essential nature of a revelation which is at once exclusive and universal, which proclaims itself as Truth among partial truths and falsehoods, which makes absolute claims and knows (in a sense) that they will be rejected, which is a light shining in a darkness that has not comprehended it.

'Some speak grudgingly or fault-findingly about the heights of the non-Christian religions and are inclined to lay all stress on their horrible depths. Others assiduously emphasise the heights of these religions but remain largely silent about the dark sides. Both, therefore, have a distorted view of these religions, not so much because they unduly vituperate or unduly praise them (although they certainly do so), but because they have a distorted view of Man, whose nature is angelic and satanic. We must honestly recognise the angel as well as the demon in Man, wherever we find him, in Christendom, in Hinduism, in China or anywhere else.'²

You describe the 'diabolical' theory of Paganism as an 'ingenious hypothesis' of 'Early Modern Western Christian missionaries'.³ But it goes back at least to St. Paul, who saw Paganism as bondage to τὰ στοιχεῖα τοῦ κόσμου.⁴ You imply that it is a perverse 'hypothesis'. Perverse and uncharitable, of course, its application can be and often has been, but it originates in spiritual insight into the intrinsically demonic potentialities of Paganism. What St. Paul describes in Rom. i. 20-25 is part of the experience of every missionary: that other religions are not only foreshadowings of Christianity, but also genuine autonomous idolatries, manifestations of the forces of spiritual evil that Christ came to vanquish.⁵ Consequently Christian missionary thought has always moved

¹ Daniélou, op. cit., pp. 75-76.

⁴ Gal. iv. 3 and 9; Col. ii. 8.

⁵ Matt. xii. 29, Luke x. 18, John xii. 31, xvi. 11. Cp. Col. i. 13, ii. 15, 1 John iii. 8.

between two poles, an emphasis on the similarities in Paganism to Christianity, and an emphasis on the radical otherness of Christianity. The first view is perhaps represented most clearly today by Roman Catholics like Daniélou, who are in the tradition of Matteo Ricci, while the 'radical' view has its classic modern expression in the book already quoted of Kraemer's, a Calvinist scholar who has had long missionary experience in the Far East. The two views are complementary: there is not contradiction between them, but a necessary tension. Therefore

'le rapport du christianisme aux autres religions . . . est d'une part historique, c'est-à-dire qu'il y a entre le christianisme et les autres religions une relation "chronologique", dans la mesure où il représente ce à quoi tout le reste aboutit; mais c'est en même temps une relation "dramatique", c'est-à-dire que, s'il est vrai que le christianisme achève, il faut dire aussi qu'il détruit et que, par conséquent, les religions païennes d'une part s'épanouissent en lui, et d'autre part meurent pour lui faire place.'¹

The 'dramatic' relationship becomes most apparent at the point where another religion rejects its vocation of being a precursor of Christianity and passes over into the attitude of an adversary, as the Jews themselves did when confronted with Jesus Christ. This is how Daniélou sees the ultimate opposition between the Syriac tradition and the Indic tradition:

'Bouddha a été l'un des grands précurseurs du Christ et sera son dernier adversaire. Bouddha, représentant éminent de la religion cosmique, prébiblique, est à la fois celui qui dans les profondeurs du passé a préparé mystérieusement l'Inde à recevoir Jésus-Christ, en faisant l'éducation de son âme, et c'est encore lui qui dans le drame spirituel suprême du monde, quand Israël lui-même "sera intégré",² disputera l'âme de l'Inde au Christ, en opposant à l'universalisme chrétien l'universalisme de la religion cosmique, qui est ce qui lui ressemble le plus, la caricature de la catholicité, le syncrétisme.'³

Perhaps the most that can be said about the history of this tension in the Christian attitude to other religions is that, as Christianity has become less concerned with primitive religions of the kind that it superseded in the Roman Empire and has become more concerned with the other Higher Religions, so its emphasis has shifted from apprehension of the demonic character of other religions to recognition of their *prae-paratio evangelica*. But this, once again, has taken place within the abiding framework of tension, of a 'dramatic' relationship, because these spring from the very nature of spiritual life and of Christianity itself. Now, as always, Christianity comes not only to fulfil, but also to purge.

'When the word "approach" is taken in the sense of Christianity as a total religious system approaching the non-Christian religions as total religious systems, there is only difference and antithesis, and this must be so because they are radically different. To minimise this results in a weakening and blurring of the true character of Christianity. Wilamowitz in his . . . book on *The Faith of the Greeks* mentions as one of the principal reasons of the victory of Christianity in the Ancient World the fact that it rejected all other gods and proclaimed the absolute monarchy of the

¹ Daniélou, op. cit., p. 9.

² Rom. xi. 51.

³ Daniélou, op. cit., pp. 67-68.

One Living God; in other words, that it remained true to its essential nature. To remain true to its essential character is also to-day the unbreakable law of Christianity.¹

Let it be added that for a Christian to speak of the demonic potentialities of other religions does not preclude recognition of the possibility of demonic perversion of Christianity itself: it implies it. The Christian will be grateful for your insistence that 'the intransigence of the Christian martyrs degenerated into the intolerance of Christian persecutors',² and will confess the spiritual truth in your criticisms of Christianity,³ even when he disagrees with the way in which they are formulated. *Corruptio optimi pessima*. For the Christian, the discussion of the relations between Christianity and the other Higher Religions has to start from its recognition that Christians, more than anyone else, are under judgement.

'The only valid and indestructible foundation of missions is the apostolic consciousness of joyful obedience to God's Will as manifested in the revelation in Christ, and our gratitude for this divine gift. All questions of superiority in the field of cultural experience or psychological religious experience are irrelevant in this context. No pretensions whatever, derived from presumably superior ethical or religious or cultural elements, have anything to do with the apostolic claim and obligation of Christianity. Its only foundation is the objective and plain reality of God's revelation in Christ, and therefore, speaking fundamentally, it is quite immaterial whether the World asks for it or not. The only way to become wholly purged from all kinds of superiority-feeling is, not the direct pursuit of a sympathetic or generous spirit towards other cultural experiences, however praiseworthy and valuable this may be, but the radically apostolic attitude; for this presupposes the not less radical humility that issues from the fact that all men of all civilisations (the "Christian" included) are, in the light of God's revelation, forlorn sinners and rebellious children of God.'⁴

6. For these reasons the Christian critic will, I think, be dissatisfied with your handling of 'the crux for an historian brought up in the Christian tradition', and will hold that your solution of the problem of the relationship between Christianity and the other Higher Religions fails to be in Christian terms. He will be able to accept neither your premiss of the spiritual equivalence of the Higher Religions derived from the secondary civilizations nor the conclusion, to which it inevitably leads, that they have a common destiny.⁵ He will note that in due course you qualify your assumption by tentatively suggesting a spiritual deficiency in the Indic religions which has led to an apparently inconsistent assimilation to Christianity;⁶ but it will seem to him that in the end, with your argument of the 'harmony' or 'symphony' of the Higher Religions,⁷ you yourself capitulate to a Hindu mode of thought.

¹ Kraemer, op. cit., pp. 300-1.

³ Kraemer, op. cit., p. 300.

⁴ On pp. 440-1 and 452, above.

⁵ pp. 442-3, above.

⁶ VII. A (iii) (d) 3, Annex, 'Immortality and Karma', p. 758, below; VII. A (iii) (a), Annex II, 'Higher Religions and Psychological Types', pp. 719, 725, n. 1, and 735, above; cp. V. vi. 45-47.

⁷ p. 428, above, and VII. A (iii) (a), Annex II, 'Higher Religions and Psychological Types', p. 735.

'Hinduism is wholly free from the strange obsession of the Semitic faiths that the acceptance of a particular religious metaphysic is necessary for salvation. . . . The main note of Hinduism is one of respect and good will for other creeds. When a worshipper of Viṣṇu had a feeling in his heart against a worshipper of Śiva and he bowed before the image of Viṣṇu, the face of the image divided itself in half and Śiva appeared on one side and Viṣṇu on the other, and the two smiling as one face on the bigoted worshipper told him that Viṣṇu and Śiva were one. . . .

'To obliterate every other religion than one's own is a sort of bolshevism in religion which we must try to prevent. We can do so only if we accept something like the Hindu solution, which seeks the unity of religion not in a common creed but in a common quest. Let us believe in a unity of spirit and not of organisation, a unity which secures ample liberty not only for every individual but for every type of organised life which has proved itself effective. For almost all historical forms of life and thought can claim the sanction of experience and so the authority of God. The World would be a much poorer thing if one creed absorbed the rest. God wills a rich harmony and not a colourless uniformity. The comprehensive and synthetic spirit of Hinduism has made it a mighty forest with a thousand waving arms each fulfilling its function and all directed by the spirit of God. Each thing in its place and all associated in the divine concert making with their various voices and even dissonances, as Heraclitus would say, the most exquisite harmony should be our ideal.'¹

This is the same position that you finally arrive at, in words very similar to your own.² Nor will the Christian critic be touched by the argument which governs your discussion throughout, and is at once its starting-point and its conclusion, that 'each religion is ever seeking, like the psychological type which it serves, to achieve the impossible feat of ministering to the whole gamut of the Psyche's elemental needs for expression. The feat is impossible because there is not, and cannot be, any spiritual organ capable of playing a psychic diapason; and therefore any existing higher religion that aspires to become *the* Universal Religion is doomed to disappointment'.³ He will reject this psychological relativism, first, because of the methodological doubts which I have suggested above; secondly, because it attributes an established scientific validity to a typological theory which is only one (and not the most widely accepted) among many, and which is at best no more than the intuitive schematizing of a great psychological artist; and, thirdly, because the evidence which you abundantly provide suggests that each Higher Religion in fact attains considerable success, by its internal development and articulation, in 'ministering to the whole gamut of the Psyche's [hypothetical] elemental needs for expression'. But he will reject it also for the *a priori* reason that the Christian Revelation is nonsense if there is only an 'arbitrarily favoured fraction of Mankind that happens to be psychologically equipped'⁴ for the acceptance of the Gospel.

'We Catholics do not quarrel with the methods of the religious historian,

¹ Radhakrishnan, S.: *The Hindu View of Life* (London 1927, Allen & Unwin), pp. 37 and 58-59.

² Cp. Clement Webb's criticism of Hinduism, quoted *ibid.*, p. 48.

³ VII. A (iii) (a), Annex II, 'Higher Religions and Psychological Types', p. 734, above, transposed from the past tense into the present.

⁴ p. 443, above.

so long as he keeps within his proper limits, within the limits of historical data and proved historical fact, and so long as he does not claim in his classification of religious types to pass decisive judgment upon the essential nature of the religious structure which he has under examination. We Catholics acknowledge readily, without any shame, nay with pride, that Catholicism cannot be identified simply and wholly with primitive Christianity, nor even with the Gospel of Christ, in the same way that the great oak cannot be identified with the tiny acorn. There is no mechanical identity, but an organic identity. And we go further and say that thousands of years hence Catholicism will probably be even richer, more luxuriant, more manifold in dogma, morals, law and worship than the Catholicism of the present day. A religious historian of the fifth millennium A.D. will without difficulty discover in Catholicism conceptions and forms and practices which derive from India, China and Japan, and he will have to recognise a far more obvious "complex of opposites". It is quite true, Catholicism is a union of contraries. But contraries are not contradictories. Wherever there is life, there you must have conflict and contrariety. . . . All peoples, each with their special aptitudes, are her [the Catholic Church's] children, and all bring their gifts into the sanctuary. The elasticity, freshness of mind and sense of form of the Roman combine with the penetration, profundity and inwardness of the German, and with the sobriety, discretion and good sense of the Anglo-Saxon. The piety and modesty of the Chinaman unite with the subtlety and depth of the Indian, and with the practicality and initiative of the American. It is unity in fullness, fullness in unity. The individual life of men and peoples—the most precious thing in the World and unique in character—flows with its rich and sparkling waters in all the innumerable courses and channels dug by missionaries in far lands; and those countless tributaries flow into the Church, and, purified in the Holy Spirit by its infallible teaching, merge into a single mighty stream, into one great flood which flows through all Humanity, fertilizing and purifying as it goes. That is the true conception of the Catholic Church.¹

The difference between this passage and the quotation from Radhakrishnan above, which is so close to your own view, is the difference between Catholicism and syncretism. Karl Adam is a Roman Catholic; Protestants see the development of the Church in federal rather than unitary terms as the propagation of autonomous and self-propagating indigenous churches.² Indeed, the reason why Protestants of the Reformed tradition would hesitate to accept the quotation from Karl Adam with the substitution of 'Christianity' for 'Catholicism' is because of the belief that the Roman Catholic theory of the development of doctrine compromises the purity of the original *κήρυγμα* and that Roman Catholicism already goes too far in the direction of syncretism.³ But this issue between the Roman Catholic Church, the members of the World Council of Churches, and the Moscow Patriarchate, which together compose the Christian World today (which is also an issue *within* each church, as it was between Matteo Ricci and Clement XI, who finally condemned his methods) is nothing compared with their common distance from your

¹ Adam, Karl: *The Spirit of Catholicism*, translated by Dom Justin McCann, O.S.B., (London 1929, Sheed & Ward), pp. 2 and 146.

² Cp. the writings of K. S. Latourette and Kraemer, op. cit., pp. 405-27.

³ Cp. Kraemer, op. cit., pp. 403-4.

own conclusion. For it is a debate within the common ground of conviction that the Church (however defined, and whatever its proper methods) is in the World to redeem it and that its *raison d'être* is to convert all nations. Paul's doctrine of the gathering of the Gentiles¹ is only a development of Christ's own declaration of the oecumenical character of His mission, and is foreshadowed, in simpler terms, by the Prophets' vision of an ultimate day in which all the World will acknowledge the God of Israel.

'And it shall come to pass in the last days, that the mountain of the Lord's house shall be established in the top of the mountains, and shall be exalted above the hills; and all nations shall flow unto it. And many people shall go and say, Come ye, and let us go up to the mountain of the Lord, to the house of the God of Jacob; and He will teach us of His ways, and we will walk in His paths: for out of Zion shall go forth the law, and the word of the Lord from Jerusalem. . . . In that day shall there be an altar to the Lord in the midst of the land of Egypt, and a pillar at the border thereof to the Lord. And it shall be for a sign and for a witness unto the Lord of hosts in the land of Egypt: for they shall cry unto the Lord because of the oppressors, and He shall send them a saviour, and a great one, and He shall deliver them. And the Lord shall be known to Egypt, and the Egyptians shall know the Lord in that day, and shall do sacrifice and oblation; yea, they shall vow a vow unto the Lord, and perform it. And the Lord shall smite Egypt: He shall smite and heal it: and they shall return even to the Lord, and He shall be intreated of them, and shall heal them. In that day, shall there be a highway out of Egypt to Assyria, and the Assyrian shall come into Egypt, and the Egyptian into Assyria, and the Egyptians shall serve with the Assyrians. In that day shall Israel be the third with Egypt and with Assyria, even a blessing in the midst of the land: Whom the Lord of hosts shall bless, saying, Blessed be Egypt my people, and Assyria, the work of my hands, and Israel mine inheritance.'²

But, while he will disagree with so much that you say, the Christian critic will be deeply grateful to you for this Part, because it will appear to him that, just as you have abandoned your original judgement that all civilizations are philosophically equivalent and have found that 'civilizations . . . have ceased to constitute intelligible fields of study for us and have forfeited their historical significance except in so far as they minister to the progress of Religion',³ so the suppressed logic of your argument (rather than the weight of your evidence) drives on towards discarding your assumption that all higher religions are spiritually equivalent, and to the conclusion that the higher religions in their turn cease to be intelligible fields of study and forfeit their historical significance except in so far as they are related to Christianity.

¹ e.g. Gal. iii. 28, Eph. i. 10, ii. 11-14, Col. iii. 11.

³ p. 449, above.

VII. A (iii) (c), ANNEX

HOLY WRIT

THE recentness of the epiphany of the higher religions was advertised by the importance of the role that Holy Writ played in their life; for writing and reading were highly sophisticated media of mental intercourse, inasmuch as they were devices which reduced to a minimum the element of physical action entailed.

When Faust¹ substitutes 'Deed' for 'Word' in the opening verse of the Gospel according to Saint John in which the Evangelist declares what 'was in the beginning', the audacious reviser is showing himself a good historian; for a lively form of action is the natural means by which Man communicates his wishes, feelings, and thoughts to his fellows; and, in the progressive development of the semantic art, we may guess that a choric mime preceded a choric drama in which physical action was accompanied by intelligible words, as we know that words chanted by a choir as an accompaniment to dramatic action preceded words sung or recited by an individual prophet or bard to a listening audience. This living word disengaged from corporate physical action must have seemed a poor substitute at first, before the gradual exploration of its latent potentialities; and, if the sounding word that lives on the speaker's lips and in the hearer's ear would seem a bloodless medium of intercourse to the ecstatic participant in a Bacchic chorus, he would feel, *a fortiori*, that the silent word engraved, inscribed, or printed on stone, potsherd, parchment, or paper was too jejune to be taken seriously. The art of writing had, however, been coeval with the species of Society that we have called 'civilizations', at any rate in the Old World; and the possession of 'household books', sacred or profane, had been characteristic of Old World civilizations of all generations later than the first—though the inanimate means of preserving these literary treasures, which had always been available since they had first been brought into existence, had been spurned, through long ages, in favour of a living transmission of 'Homer' from rhapsode to rhapsode, and of the Qur'ān from *hāfiẓ* to *hāfiẓ*, 'not in tables of stone but in fleshy tables of the heart'.²

These 'household books' had been of two kinds. There had been epics inspired by the experience of barbarians belonging to the external proletariat of an antecedent civilization,³ and there had been sacred books inspired by the different experience of an antecedent civilization's internal proletariat. The Bible and the Qur'ān were classic examples of the Sacred Book, and 'Homer', the Mahabharata, and the Icelandic Saga of the Epic. Usually the Epic had been in the ascendant in a civilization that had been affiliated to a predecessor through a barbarian heroic age, and the Sacred Book in a civilization that had been affiliated to a predecessor through a church. Broadly speaking, 'Homer' had held in Hellenic life the place that the Bible had held in the lives of Western

¹ Goethe: *Faust*, Part I, ll. 1224-37.

² 2 Cor. iii. 3.

³ See V. v. 194-337, *passim*.

and Orthodox Christendom. Like the Bible, the Homeric Epic had been taken for granted, had been treasured as a *κτῆμα ἐς αἰετῆς*,¹ had been consulted as an oracle, had been quoted for emotional and aesthetic effect, and had been constantly reinterpreted, to suit the needs of different ages, till meanings had been read into it that would have been unintelligible to its makers. But this distinction between two classes of Civilization differentiated by different types of 'household book' was not clear-cut. In Western Christendom, for example, there had been an abortive Teutonic Epic which might conceivably have lived to play the part of 'Homer' if the Bible had not eclipsed it at the dawn of Western history,² while in the Indic World the epic poetry of the barbarian Aryas had not indeed been eclipsed, but been decidedly outshone, by a sacred book, in the shape of the Vedas, of which the nucleus, at any rate, had been bequeathed to the Indic Society by the same barbarians.

Barbarian sacred books, however, were as rare as religious epics; and this was no accident; for the normal association of sacred books with higher religions derived from a characteristic of higher religions that was one of their distinguishing features. The higher religions had been founded and developed by personalities that had become historic through impressing themselves on the imagination of Posterity; and the medium through which they had made this personal impression on disciples who had never seen them in the flesh had been a message enshrined in a sacred book preserved 'in the tables of the heart' if not on paper.³

¹ Thucydides, Book I, chap. 22.

² See I. i. 449, n. 2, and II. ii. 320-1.

³ As the writer of this Study saw it, the Mahāyāna had been conjured out of the philosophy of the Buddha by the lives and works of Aśvaghoṣa, Nagarjuna, and Vasubandhu (see Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Edward Arnold, 3 vols.), vol. ii, pp. 82-89), while the post-Buddhaic and anti-Buddhaic Hinduism which was one of the four principal living higher religions in the writer's day had been inspired from the same source in the life and works of Śaṅkara (see Eliot, op. cit., vol. ii, pp. 206-11). The conformity in this respect between the Buddhaistic and the Judaistic higher religions, which had struck the writer's eye, was queried by Mr. Martin Wright in the following comment:

'Surely neither Hinduism nor the Mahāyāna was founded by an historic personality, and neither was a sacred book which enshrines such a personality's message. Is there not a radical difference between the two higher religions of the Judaic tradition, which are prophetic religions, with historical founders and sacred books *sensu stricto*, and on the other hand the two higher religions of the Indic tradition, which are non-historical and non-prophetic (except in the indirect degree in which the Mahāyāna derives from the Hīnayāna), and whose sacred literature is heterogeneous?

'The following distinctions seem to me, if they are not very wide of the mark, to belong to your exposition:

(i) Hinduism: sacred literature of the barbarian epic kind, as you say;

(ii) Hīnayāna: The Pali Canon, at least in *The Discourses of the Buddha* and perhaps *The Book of the Great Decease*, is analogous to the Gospels in being the record of an historic personality; but, since you classify Gautama as a philosopher, not a prophet, perhaps one should say analogous to the Platonic and Xenophontic record of Socrates and to the Confucian *Analects*;

(iii) Mahāyāna: the Sanskrit Canon, in so far as I can grasp its nature, consists in a tiny kernel of historic and prophetic record (such kernel as can be found in the lives of the Buddha), if one is to think of the Buddha as having been posthumously transmogrified from a philosopher into a prophet in the development from the Hīnayāna into the Mahāyāna, surrounded by a vast pulpy fruit of devotional and theologico-philosophical writings in the *Sūtras* and related documents. Would it be a fair comparison to say that the Mahayanian sacred literature resembles the Christian Patristic writings divorced from the Old and New Testaments?

The writer would agree that in the two Buddhaistic higher religions, as compared with the two Judaistic, the part played by historical personalities and by scriptures purporting to enshrine their personal teaching was not of the same overwhelming

Such sacred books had not established their authority without a struggle, however great might have been the prestige of the prophets whose messages they had embodied; for they had never found the domain of Religion untenanted. A traditional corporate liturgy, operated by a priesthood, had always been before them in the field, and, in so far as they had succeeded in winning their way against such time-honoured rites and securely vested interests, they had triumphed through managing to meet some importunate unsatisfied social need.

One emergency that had made the fortune of sacred books had been the social calamity of deracination. 'Displaced persons', whether they be refugees or deportees, are physically prevented by their geographical removal from continuing to worship at their ancestral shrines; and, since the due celebration of a rite at the proper place may be as essential to the religious efficacy of the proceedings as the performance of the proper gestures and the utterance of the proper words, the members of an exiled community may find themselves debarred from perpetuating the liturgy that has been their traditional means of communion with their god and with one another. In exile, this communion will have become more than ever precious, since it will be the sole remaining sustenance of a communal life which has lost its roots in a soil that the exiles can no longer call their own; and there will be a proportionately strong incentive to find some new medium of religious communion to replace the liturgy that has been abandoned perforce. In this desperate emergency a sacred book recorded in the tables of the heart—or even in the less durable, but hardly less portable medium of ink and paper—may save the situation by taking the lost liturgy's place.

The classic example of this enforced replacement of a liturgy by a book is, of course, the ritual revolution which was Jewry's response to the ordeal of being dispersed abroad among the Gentiles. In the Jewish communities of the Diasporà the priest offering sacrifices at the altar in the Temple at Jerusalem had to be supplanted by a reader reciting from the books of the Law and the Prophets on a reading-stand in the synagogue; and after the destruction of the Temple and the Roman Government's ban on the residence of Jews in Aelia Capitolina—the Hellenic city founded by Hadrian on the site where Jerusalem had stood—the Diasporà's form of worship was the sole form surviving. This triumph of the Torah in the Jewish Diasporà is manifestly an example of the same stimulating effect of new ground that we have observed already in another context,¹ where we have noticed how the Hellenic and Teutonic Epic and the Scandinavian Saga all flowered overseas—in Ionia, in Britain, and in Iceland—after a migration on board ship which had given the diction of poetry an opportunity to shake itself free from the trammels of an earth-bound ritual in order to become a

importance as it was in Christianity and Islam. On the other hand, he would maintain that the resemblance in this respect between the two pairs of living higher religions became not merely apparent but significant when they were viewed against the foil of antecedent primitive religions in which the alpha and the omega of piety consisted in the corporate performance of traditional rites, and in which neither scriptures nor historical personalities played any part at all.

¹ In II. ii. 92-96.

vehicle for expressing experiences that were, not corporate and repetitive, but personal and unique.

Another emergency that had made the fortune of a sacred book had been a revolutionary change in the direction of mimesis—a revolution precipitated, not by external forces driving a community into physical exile, but by a voluntary and deliberate transfer of allegiance from an ancestral tradition preserved by a priesthood to a revelation proclaimed by a prophet. If the formidable authority conferred on the priests by their custody of tradition is to be challenged, the challenge can be delivered only by the word of God Himself as revealed in His prophet's message; for, if that message is once recognized to be authentic, it must override the rulings of priests who are not God's spokesmen but merely His ministers; and, though the winged words of God's living human spokesman will be likely to have both a greater virtue¹ and a greater effect than any written testament, dumb scripture has one decisive posthumous advantage over the living voice. Scripture can attain a longevity which, at second hand, will multiply a hundredfold the brief life-span of the prophet whose message this frozen echo perpetuates. Holy Writ that purports to enshrine prophetic revelation is thus a *malleus presbyterorum* that is a literal godsend to rebels against sacerdotal authority. The followers of the Prophets of Israel and Judah and of Zarathustra made effective use of this weapon against the priests of their day; the Scribes and Pharisees used it against the Sadducees; the Protestant Reformers used it against the Papal Church.

This revolutionary attack in the name of Holy Writ had been met by the priests with varying degrees of success in different cases. The Jewish priesthood was eventually worsted by a combination of adverse circumstances: the Babylonish Captivity; the permanent preponderance of the Diaspora over a reconstituted temple-state at Jerusalem; the destruction of Jerusalem by the Romans and consequent cessation of the Hierosolymitan liturgy of sacrifice; and, above all, the gradual change of outlook and *êthos* in Jewry from a communal towards an individual relation to God. On the other hand the Magi signally defeated Zarathustra by playing upon his too simple-minded followers the confidence-trick which the English King Richard II sought to play upon a rebel peasantry when he cried 'I will be your leader!'; and, by an equally skilful use of similar tactics, the Brahmans had managed to survive the epiphanies of a long series of sacred books, from the Vedas onwards. The error of short-sighted priests who had clumsily ensured the prophets' triumph by ill-advisedly putting them to death had been retrieved by those priests' far-sighted children, who had contrived to sterilize the martyrs' spiritual legacies by building their sepulchres;² and the efficacy of this stratagem had been so great that it had proved able to weather even a

¹ 'The main force in promoting higher spirituality or morality among men has been the apparition of prophetic souls whose teaching cannot be accounted for by what went before them, and who appear by their commanding influence to drive men by a new impulse in a new direction. The new impulse is, perhaps, never afterwards wholly exhausted or lost. But it becomes merged in the general channel with other currents, and, though it adds something to the whole, it tends to become less and less distinctive' (Gore, Charles: *The Philosophy of the Good Life* (Everyman edition), p. 58).

² Matt. xxiii. 29-31; Luke xi. 47-48.

scathing exposure. They 'say: If we had been in the days of our fathers, we would not have been partakers with them in the blood of the prophets.'¹ The priest had drawn the sting of the prophet's message when, under the cloak of a feigned repentance, he had constituted himself the official interpreter of the prophetic books.

The tale of sacred books whose fortunes had been made either by the accident of physical exile or by the act of spiritual revolt had subsequently been increased by the working of the motive of emulation; for an established sacred book is an impressive instrument of power which confers on its possessors an enviable prestige in the estimation of parvenus who have no Scriptures of their own to pit against it; and the obvious remedy for a new religion is to put itself on equal terms with its seniors by producing a distinctive sacred book of its own. The Primitive Christian Church created the Bible by adding the New Testament to an Old Testament that was its scriptural heritage from Jewry. The children of the Arabs of 'the Days of Ignorance' could hold up their heads in face of the Jewish and Christian 'People of the Book' when they had received the Qur'ān from the divinely inspired lips of their own prophet Muhammad. The Sikhs challenged the Qur'ān by compiling the Granth; Joseph Smith challenged the Bible by producing the Book of Mormon, and Mary Baker Eddy by publishing *Science and Health*.²

Thus emulation, revolt, and exile had all played their part in providing opportunities for Holy Writ to assert its authority at the expense of 'priestcraft'. This conflict between priest and book was one expression of a more fundamental antagonism between the incubus of a traditional collectivism and the aspiration of an individual soul to enter into personal communion with God, and on this showing the future might appear to lie with Holy Writ—though this tentative judgement might be discounted as a Jewish, Protestant, Muslim, and Sikh aberration by Catholic Christian champions of sacerdotalism. In any event, experience indicated that priestcraft was not likely to be driven off the field either quickly or easily, considering the ability that it had already shown in quoting scripture to its purpose.

'The established religion [always] appeals to [the sacred books]. It declares their contents to be everlasting and sacrosanct; but in reality it is the Establishment, and not the Scriptures, that determines, at its own discretion, the content of its doctrine. What is in agreement with the Establishment's position is deduced from the text of the sacred book; everything else is twisted round and very often interpreted into the very opposite of its original meaning, or else is simply ignored; and woe to him who should venture to appeal to this [original meaning] or to declare

¹ Matt. xxiii. 30.

² Mr. Martin Wight notes: 'And the same process appears to have occurred, not deliberately but subconsciously, in Marxian Communism as it has developed into a religion, so that the writings of Marx and Engels have come to occupy the place of the Old Testament in Christian holy writ, the writings of Lenin (in whose life the Marxian meaning of History became incarnate, as the Christian meaning of History became incarnate in the Life and Passion of Christ) have become the counterpart of the Gospels, and the writings of Stalin have come to resemble the Pauline Epistles—the principal authorised interpretation of the historical revelation, which shallow and mistaken critics regard, in either case, as having been a perversion, but which was, in either case, a formulation and fulfilment.'

it to be binding. The last word lies, not with the sacred book, but with the tradition that the Church has created and now embodies. The Vedic hymns (to take one example) contain not a word about Brahma, not a word about Shiva, and very little about Vishnu; the Bible contains not a word about the fundamental doctrines of the Catholic Church: about the commanding position of the priesthood and the Papacy, about the cult of the Saints, the worship of the Host, the sacraments, Purgatory, confession, and so on.¹ Conversely the Holy Scriptures include books that have nothing in the world to do with Religion: historical works, sagas and romances; collections of erotic poetry like the Song of Songs; and sceptical philosophical works like *Qoheleth*, which are transformed into revelations of religious mysteries by master-strokes of ecclesiastical interpretation. Paradoxical though this may sound, it can positively be maintained that, for any fully developed religion, the contents of its sacred books are virtually a matter of complete indifference: any book in the world may become a sacred book through some freak of Chance.²

This cynically written passage would appear, on consideration, to be neither so paradoxical nor so shocking as it might seem at first sight; for, while it was true that the original meaning of Holy Writ always might be, and sometimes had been, misinterpreted to suit the institutional interests of a church that was hypocritically professing a scrupulous respect for the divine revelation of which it claimed to be the divinely appointed trustee, it was also true that the reading of new

¹ Hindu and Christian apologists would, no doubt, retort to this sweeping assertion by copious citations of Holy Writ as a warrant for their practices and beliefs.—A.J.T.

² Meyer, E.: *Geschichte des Altertums*, vol. i, Part II, 4th ed. (Stuttgart and Berlin 1921, Cotta), p. 60.

Mr. Martin Wight comments: 'This is a fascinating quotation, but, if you end on this Voltairean note and implicitly commit yourself to an acceptance of Chance as the determining factor, you will seem once again to swing the balance too far and to speak inconsistently with what you say elsewhere. The reader may legitimately feel that you cannot be both as sceptical and anti-providential in your historical conclusion about the Christian Scriptures and as Christian as, in general, you are throughout this Part.' To this the writer would reply that a feeling which might be legitimate for his reader might at the same time be, for the writer, an illegitimate temptation to evade an ordeal which he had been challenged to encounter and to endure. *Sentio et exorcior*; but the painfulness of a tension between unreconciled dictates of Heart and Head gives Dipsychus no warrant for evading the pain by opting exclusively for one or other of these two conflicting masters, so long as the price of thus cutting the knot is the deliberate sacrifice of sincere convictions. So far from that, the natural human impulse to find and apply an anaesthetic, without counting the cost, might be a temptation that ought to be strenuously resisted. The bodhisattva who refrains from fading out into *Nirvāṇa* when this is at last within his reach may be doing better than the arhat who recognizes and pursues no other goal than that of entering into his rest, if the bodhisattva's motive for thus deliberately tarrying in the painful realm of mental strife is a sincere desire to continue to play one creature's tiny part in a common search for 'the glorious liberty' in quest of which 'the whole creation groaneth and travaileth in pain together until now' (Rom. viii. 21-22). The war between Heart and Head by which the writer's generation in a Westernizing World was being ravaged seemed to him to be a tribulation which that generation must expect to continue to endure all the days of its brief life on Earth. Its vocation seemed to him to be, not to seek release from this ordeal, but to play a manful part in serving God by humbly helping Him to turn His creatures' tribulation to account for His own creative purposes. The tribulation of being vouchsafed no more than a Pisgah sight of the Promised Land was visited by the Lord upon Moses and was accepted by Moses at the Lord's hand without repining; and this last trial was the consummation of a lifetime of toil and frustration. Yet this servant of the Lord who thus died without ever crossing the Jordan had not lived in vain on that account; for he had lived to play his part, through forty years of wandering in the Wilderness, in finding a way for Israel to reach the borders of a Promised Land from the providentially opened doors of a House of Bondage.

meanings into old words was one of the Human Spirit's well-tried and well-justified methods of gaining fresh spiritual insight; and thus a Holy Writ which had originated as an imperfect vehicle for commemorating the inspired message of a dead prophet, and had survived to be perverted into an effective instrument for promoting the mundane interests of a living church, might come to serve, in a third chapter of the story, as an organ for expressing new inspirations in the souls of the prophet's followers in latter days when prophet and church in turn had passed away.

IMMORTALITY AND KARMA

If, as has been suggested in a previous passage,¹ History wins meaning and value for Man in so far as Man co-operates in History with God, this meaning and value of History must be found in some mode of being which transcends that of Human Life on Earth; for, while God is master of History, as of all things, God's life, in which Man shares by co-operating with Him, is not confined to the dimensions of Time and Space. God's infinity is not just ubiquity, nor His eternity just everlastingness; and, on these analogies, the immortality attained by Man in virtue of a relation with God cannot be just Human Life disengaged from Space and prolonged in Time *in saecula saeculorum*. Time and Space had been shown by a Modern Western Science to be each unthinkable apart from the other; for they had been proved to be no more than abstractions from a Reality which included both these theoretical components in so far as it could be said to include either. The bearing of this recent Western philosophic insight upon human destiny had been anticipated by an Epicurean school of Hellenic philosophy through an empirical observation of the trajectories of human lives in their passage through This World.

Praeterea gigni pariter cum corpore et unâ
 crescere sentimus pariterque senescere mentem.
 nam velut infirmo pueri teneroque vagantur
 corpore, sic animi sequitur sententia tenvis.
 inde, ubi robustis adolevit viribus aetas,
 consilium quoque maius et auctor est animi vis.
 post, ubi iam validis quassatum est viribus aevi
 corpus, et obtusis ceciderunt viribus artus,
 claudicat ingenium, delirat lingua, labat mens,
 omnia deficiunt et uno tempore desunt.²

Whether the life-curve is thus carried to its natural term of a death ushered in by a gradual decay of physical and psychic faculties, or whether it is broken off short by a premature death through accident, it is inconceivable that this curve can be prolonged after death in the Time-dimension in which it has been either completed or interrupted in the course of life.

Nor can Man's immortality be retrieved in the Time-dimension by equating it with the lasting difference which is made to the whole social future of Mankind on Earth by even the shortest life of the most insignificant personality. No doubt every human life-trajectory does have this enduring effect, just as the motion of a single atom or electron affects the equilibrium of the whole physical universe. But this so-called 'impersonal immortality' is no redemption of Man's role in terrestrial history; it is the heart of the nightmare of Human Life on Earth without the

¹ On pp. 512-13, above.

² Lucretius: *De Rerum Natura*, Book III, ll. 445-54.

fellowship of God; and the nightmare would not be dispelled even if we were warranted in inverting the poet's melancholy reflexion that

The evil that men do lives after them;
the good is oft interrèd with their bones.¹

If our acts in This Life are the stuff of which our immortality is made, this is in virtue of their influence, not on human affairs on Earth, but on the relation between the human actor and God, and we must believe that in God's sight the spiritual balance-sheet of a human life on Earth is, for good or evil, of equal moment whether that life has been socially significant or insignificant and whether it has been long or short.

For such my faith or fondness—which you will—
This strange conviction would possess me still:
That by heroic act or generous deed,
Agony, abnegation, loving heed,
Our mortal nature could from Time be freed,
And suddenly outsoar, while still on Earth,
Its long, low drag of days between the grave and birth,
And touch a plane of life transcending Time's,
As a dull-ticking clock suddenly chimes.

.
Free of Time's trammel, clear of Earth and Skies,
In that immortal instant will they rise,
And with a loftiness of being live
Beyond the summits happiness can give:
Fulfilled, though stricken; absolute, though bound;
Effaced on Earth, and yet, beyond it, found;
Traceless, and yet with more than fame renowned.²

The sum of the spiritual values, positive and negative, that arise from the acts of a human being in his passage through Life on Earth had been designated *Karma* ('the product of action') by philosophers of the Indic school, and they had perceived that the spiritual plane on which *Karma* waxes and wanes must be in a different dimension altogether from the dimensions of Space and Time. It would follow that *Karma*, once generated, would have an existence of its own that would not be affected by the death on Earth of the personality from whose earthly acts it had sprung; and this Indic vision might give Judaic souls an insight into the nature of an immortality which is not in Time but is both 'now' and 'always', if the two parties did not disagree in their judgement of the implications.

In the sight of Judaically oriented souls, immortality was bound to seem an inestimable boon, even though the Soul's hope of Heaven might be haunted by a fear of Hell; for the hope of Heaven was a hope of communion with God in the Beatific Vision. In the sight of Indically oriented souls, immortality would be an intolerable burden, even if they did not believe, as they did believe, that a debit balance of *Karma* would condemn the vehicle of it to return to the sorrowful treadmill of birth-

¹ Shakspeare: *Julius Caesar*, Act III, scene ii, ll. 38-39.

² Skinner, Martyn: *Letters to Malaya*, v (London 1947, Putnam), pp. 74 and 76.

death-birth. A liberating purgatory had been desired by compassionate Buddhist hearts as wistfully as by their Christian counterparts; but the immortality from which Buddhist arhats sought liberation was not just an immortality in Hell; it was immortality itself—against which the arhat would consistently repine even if it were the immortality of Heaven. Can Man release himself from immortality, as the Buddha believed and taught, by dissolving *Karma* into *Nirvāna*? *Nirvāna* resembles its opposite, the quintessence of personality, in being indifferent to Space and Time, but this not through rising above them into communion with the personality of God, but through sinking below them into the abyss of Subconsciousness. Supposing that *Nirvāna* were attainable by the Buddha's prescription, would the attainment of it be the highest good for Man or the worst catastrophe?

The answer to this last question would depend on whether it were felt that a retention of Consciousness was worth its price of pain, or were felt that a release from pain was worth its price of oblivion. Was the Wheel of Existence merely an infernal machine for tormenting Ixion by revolutions that were vain repetitions? Or was it the wheel of a chariot of fire on which a human being might ascend to Heaven if he could bear the ordeal? The choice between alternative answers would turn on whether the Ultimate Reality was, or was not, believed to be a personal Living God. One answer had been given by Judaism, the other by an Indic school of philosophy; and so sharp a contradiction on a point of such supreme importance might have cleft an unbridgeable schism between the Judaic and the Indic pair of higher religions, if Hinduism and the Mahāyāna had not crossed the gulf, on their own initiative, to the Muslim-Christian side in defiance of their own philosophical first principles.

VII. C (ii) (a), ANNEX

THE PREHISTORIC BACKGROUND TO THE HISTORY OF THE HIGHER RELIGIONS

In the present Part of this Study we have been investigating the historical role of the higher religions, and we have seen that their epiphany had been a very recent event on the Time-scale of History that had been revealed by the discoveries of Modern Western geologists and astronomers.¹ This stage of Mankind's religious experience was the latest chapter of what must have been a very long story. Were any of the previous chapters accessible to latter-day Western students of History?

The Hebrew tradition that had been inherited by the higher religions of Judaic origin gave an account of Man's religious history that purported to carry the story right back to the origins of the Human Race. According to this account 'the Call of Abraham', with which the history of the Judaistic higher religions opened, had not created a relation between God and Man that had never existed before; it had re-created a relation that had once existed between God and Abraham's forefather, the first man Adam, but had been broken by Adam's fall. On this view the genesis of the higher religions presented itself as a 'palingenesia': a rebirth of something old which might also be the birth of something new.² In the Pauline Christian version of the Jewish plot of the drama of Man's spiritual history 'it is written: The first man Adam was made a living soul; the last Adam was made a quickening spirit.'³

When a Modern Western Rationalism had asserted its independence of the Christian tradition, one of its first acts had been to reject, as a figment of imagination, this picture of an original communion between Primitive Man and a One True God. The existence of the God of Abraham, Moses, and Jesus was held to be an illusion, and the belief that this illusion had already captivated Primitive Man was held to be an anachronism. The adherents of the higher religions, it was suggested, had sought to lend authority to a theological invention of their own by naively presenting it as being the revival of a primordial revelation; but, in the higher critic's eye, this hypothesis of a primitive monotheism was as unsubstantial as it was facile; for, while the Modern Western scholar would not doubt that Primitive Man's theological ideas, if he had any, were illusory, he would consider it impossible to ascertain which of the innumerable illusions lying in wait for Primitive Man was the one into which he had happened to fall in the first flight of his infantile fancy. This archaic Modern Western scepticism had been shaken by the subsequent progress of anthropological research. By the time of writing, some light had been thrown on Primitive Man's religion by a study of the religion of the least sophisticated human societies still surviving. This evidence had to be used with great caution, since neither the facts nor the inferences

¹ See pp. 452-4, above.

² See V. v. 27, n. 2, and V. vi. 172-3.

³ 1 Cor. xv. 45.

to be drawn from them were by any means beyond dispute. Yet, as far as the evidence went, it did not conflict with the Hebrew legend and seemed, indeed, to bear it out.

The evidence up to date indicated two things: that there was a remarkable measure of uniformity in the practices and beliefs of the least sophisticated surviving societies, and that this distinctive common element in their religion was spiritually higher (in terms of the spiritual standards of the higher religions) than the religion of other uncivilized societies that were the superiors of these unsophisticated peoples in technology and in social organization.

The measure of uniformity was remarkable because, at the time when the evidence was collected by Modern Western anthropologists, the unsophisticated peoples were scattered, far apart from one another, over the face of the Earth, in holes and corners that had been left to them by materially more efficient competitors who had been driving them from pillar to post. If ever there had been a time when these societies had been in geographical contact with one another, that contact must have been broken several thousand, and perhaps several hundred thousand, years ago. Therefore the points of likeness between their respective religions could not have been the result of any direct borrowings by one of these societies from another. They could only have been the result either of some wave of cultural influence, radiating from one or more of the civilizations, which had reached and affected all these unsophisticated societies alike¹ at dates subsequent to their dispersion, or else of some primitive cultural heritage, once common to all Mankind, which each of the unsophisticated societies had sluggishly or simple-mindedly retained for itself after its more enterprising neighbours had discarded it.²

As between these two possible explanations, the hypothesis of a relatively recent cultural radiation from an identic external source had been favoured by Mrs. N. K. Chadwick in an attempt to account for a common theme in modern oral literature whose 'distribution . . . follows a great arc on the periphery of the Eastern Hemisphere, stretching from the Chathams in South Polynesia, round Siberia to Russia, and including the mountain masses and backward districts of Central Asia'.³ The alternative hypothesis of isolated local survivals of an original common human heritage had been favoured by Father W. Schmidt as the explanation of a similar common theme in the religion of societies of a still less sophisticated and even more widely scattered stratum: the Pygmies and Pygmoids in the mountains and forests of the extreme South and South-East of Asia and the adjacent islands; the Blackfellows in the extreme South-East of Australia and their neighbours the Tasmanians; the Negrillos in the impenetrable primeval forest of Tropical Africa and the Bushmen in the Kalahari Desert; the Samoyeds, Kamchadals, Koryaks,

¹ See II. i. 187 and V. v. 197.

² "These tribes have, apparently, never departed from the original state in which Man is contained by Nature as an animal is contained by the law of its species . . . and . . . their attitude towards the so-called boons of Civilisation is usually that of polite but adamant refusal' (Baynes, H. G.: *Mythology of the Soul* (London 1940, Baillière, Tindall, & Cox; 1949, Methuen), pp. 250-2).

³ Chadwick, N. K.: *Poetry and Prophecy* (Cambridge 1942, University Press), p. 94; cp. pp. xiv-xvi.

and Ainu in Northern Asia; the Algonkins in the extreme North-East of North America and on the prairies; the Californian Indians in the narrow corner of the west coast of North America between the Rocky Mountains and the Sea; and the denizens of Tierra del Fuego, the bleak antarctic tip of South America.¹

'No later culture can boast of a distribution which encircles the whole Earth so completely. But, if it is clear that, wherever remnants of the primitive peoples are still discoverable over this huge area, they show belief in a Supreme Being, then it is likewise manifest that such a belief is an essential property of this, the most ancient of human cultures, which must have been deeply and strongly rooted in it at the very dawn of Time, before the individual groups had separated from one another.'²

It will be seen that the difference between Father Schmidt's and Mrs. Chadwick's explanation of the presence of a common theme in the cultures of unsophisticated peoples whose latter-day habitats were widely scattered was not an irreconcilable one; for, though Mrs. Chadwick warns us 'to abandon the assumption that the culture of the most backward communities of the present day bears any relationship to that of truly "primitive" or Early Man',³ she agrees with Father Schmidt in finding that 'the farther back we can carry our researches, the higher the culture becomes and the more the immediate sources of these cultures tend to converge';⁴ and it is evident that, while this might be because the spiritually higher features in the cultures of the unsophisticated peoples had a common origin in influences recently radiated by the civilizations, these common features might have an alternative origin in a common heritage which the unsophisticated societies had retained from the dawn of human history. Whatever the source of this unsophisticated culture might be, our two Modern Western authorities concur in esteeming it to be a spiritual treasure of great price.

'In Asia, in Polynesia, even in Africa,' Mrs. Chadwick testifies, 'Man's chief intellectual pre-occupations and speculations are with spiritual adventure. . . . These spiritual adventures are the journeys which we take in our minds into the past, the hidden or distant present, and the future. The lonely pioneering of the Soul in these spheres and the defeat or success of its quest forms the principal theme in the oral literature of the Old World. . . .

'The more immediate objects of these journeys are many and various. . . . But undoubtedly everywhere the principal *motifs* are the rescue of souls from hostile spirits and the securing of the water of life and the herb of healing. Directly or indirectly the quest for immortality is the most outstanding *motif* both in Asia and in Polynesia. . . .

'This quest of immortality, the effort of men and women to master matter by spirit, is the chief intellectual pre-occupation of the men and women outside the sphere of Civilisation to-day.'⁵

⁴ Chadwick, *op. cit.*, *loc. cit.*

⁵ Chadwick, *op. cit.*, pp. 91-94.

From this spectacle of contemporary Man's still unfaded intimations of immortality in the least unchildlike of the living human societies, Father Schmidt draws an inference—in which Mrs. Chadwick would perhaps hesitate to follow him—regarding the spiritual activities of Primeval Mankind.

'Primaevial Man was far from being [a] sluggish dreamer . . . standing in stupid astonishment and fright at the world that was so new to him. The pre-historic tools and weapons and those of the ethnologically oldest peoples of to-day are alone enough to show that he was a vigorous and daring man of action. . . . He grasped the conception of cause and effect, and then adapted that to the relationship of means to end. His means, to effect the ends he desired, were his tools, which he invented and used. Now all this sufficed to lead him to a real religion, to the recognition of a supreme Personal Being; for he was able to apply these same mental powers to the contemplation of the Universe as a whole.'¹

Father Schmidt's inference reinstates, in terms of a Modern Western science, the picture of the spiritual condition of Primeval Man that is presented in mythological terms in the Book of Genesis. Supposing that we entertain Father Schmidt's thesis provisionally for the sake of the argument, shall we find the rest of the spiritual drama working out 'in modern dress' on the lines of the Biblical plot? Are there explanations, in our sophisticated terms, of Primeval Man's fall from a state of innocence and of Fallen Man's access to redemption through the grace of God? Perhaps the most promising approach to these questions will be to apply to the history of Primitive Man an empirically attested 'law' of the working of Human Nature which has already served us as a key to an understanding of the history of Man in process of Civilization.

In the history of Western Man we have seen that a rise in spiritual standards thanks to the influence of a higher religion can incidentally produce a consequent rise in material well-being, and that this incidental mundane effect of spiritual progress exposes Man to a temptation to which he readily succumbs. The material harvest of spiritual travail is apt to divert Man's energies from spiritual into material channels; and thus a spiritual regression may be the result of a material advance which a previous spiritual advance has brought in its train.² Conversely, in the histories of civilizations which had broken down and disintegrated through transferring their treasure from the Commonwealth of God to the Commonwealth of Swine, we have seen that Man's disillusioning experience of losing his life through setting his heart upon saving it had opened Man's eyes to the vanity of This World and reopened his ears to God's word, which had been uttered to him at this stage through higher religions.³ Both the need and the opportunity for the epiphany of the higher religions had sprung from the failures of Fallen Man's mundane civilizations of the first and second generations, and Man's subsequent abandonment of his allegiance to a saving higher religion in order to go a whoring after a mundane civilization of the third generation wore the

aspect of a second Fall. Did this fall of a Sophisticated Man throw light on a Primeval Man's fall and its sequel?

The history of Primitive Man could be tentatively reconstructed on the analogy of the history of Man in Australia since the advent there of the pioneers of a Western way of life. Primeval Man's state on the morrow of his becoming human could be inferred from the state in which the first White settlers in Australia had found their Black predecessors.

"These Black People were intimately related to the land over which they roamed. In its sacred places were the spirits of their ancestors and the ancient heroes of their myths. Their own spirits lived in it before they were born. Even the animals and birds and fruits of the Earth had their spirits also, and a close affinity was maintained with this spirit world by long-established sacred rites and ceremonies. Spirits, land, and people were one close-knit community, and each needed the other for life to be possible and complete."¹

These unsophisticated souls had hardly been tempted to throw over their unselfconscious communion with God in order to worship their own achievements; for, when their Modern Western destroyers broke in upon them at the turn of the eighteenth and nineteenth centuries of the Christian Era, the Australian Blackfellows, in their hitherto secluded corner of the World, were still living in the Palaeolithic Age. Their domicile at this date testifies, however, that, in thus still remaining in a relative state of innocent inefficiency, they had been exceptions to the general run of Mankind. Long before the Westerners' violation of the Blackfellows' ultimate sanctuary, other societies had already outstripped the Blackfellows in material achievement sufficiently far to have driven them, by stages, into the precarious asylum where a globe-encompassing Western Civilization eventually hunted them down and finished them off.

"The Black Man . . . was controlled by Nature. He functioned as a part of it. He dared not disturb it. It lived in him. The Civilised Man, on the other hand, set out to exploit Nature. . . . The Australian version of the Garden of Eden in which the Black Man lived naked and unashamed had no appeal to the White. The White Man had eaten of the Tree of Knowledge and had changed completely his attitude to the World of Nature and of Man. As he clothed and adorned his body with the garments of Civilisation, he unclothed his mind and will of all customary restraints and sacred sanctions. At length the will to power in Man stood forth naked and unashamed. . . . More and more he freed himself from all guidance from Nature until, in an illusion of freedom, he stood over against Nature, using it for his purposes and subduing it to his will. This led to the point where Civilised Man no longer meets God at all on the ground of Nature. God is ignored: Civilised Man is confident that 'he has no need of that hypothesis.' This, in effect, makes Man his own God."²

This regress-in-progress of a Modern Western Man is a repetition of the story of this Western Man's forerunners, the majority of Mankind, who,

¹ Burgmann, Bishop E. H.: *The Church's Encounter with Civilisation* (London 1948, Longmans), p. 8.

² Burgmann, op. cit., pp. 16 and 15.

for good or evil, had left the Blackfellows behind in embarking on the course of material achievement that was to culminate in the rises—and falls—of civilizations. Modern Western archaeological research had rediscovered an early sign of the times in the replacement of a Palaeolithic Man, cultivating a gift for expressing himself in Visual Art without being ambitious to improve upon his rudimentary tools, by an aesthetically insensitive Neolithic Man¹ producing a crop of revolutionary technical inventions which had not only been epoch-making in their day but had not been surpassed in importance by any subsequent material achievements of Neolithic Man's successors up to date.² In view of the affinity between the aesthetic and the religious faculty of the Human Psyche,³ we might expect this impoverishment of Man's aesthetic life, which was the price of the Neolithic technological revolution, to be found associated with a religious regression; and this expectation is borne out—if we accept Father Schmidt's divination of the former religion of Primeval Man from the present religion of the least sophisticated and efficient of the extant human societies—by the contrast between the relatively aetherial spiritual activities, beliefs, and aspirations of these 'backward' peoples, as described by Father Schmidt and Mrs. Chadwick, and the crass paganism of societies that had forged far ahead of them in the race for wealth and power.

In another context⁴ we have noticed Man's proneness to abandon the worship of God for the worship of some work of God which Man has newly discovered or newly mastered. In the work from which we have been quoting, Father Schmidt has laid bare, with a master's hand, the inner relation between divers forms of material achievement and the forms of idolatry that in his day were to be found in association with each of them in living societies which, by mundane standards, had raised themselves high above the level of the 'backward' worshippers of a Supreme Being. In this place it would be superfluous to recapitulate Father Schmidt's survey, but we may notice, in passing, the principal directions that these religious aberrations proved to have taken. In the rank jungle-growth of idolatry we can distinguish two main types. When Man begins to gain control over his non-human environment, he takes to worshipping fellow creatures that he has harnessed for his own immediate service, especially for supplying himself with food. The hunter's worship of his game breeds totemism; the husbandman's worship of his crop breeds the religion of the *ἐνιαυτός δαίμων*.⁵ As Man gains in knowledge, he begins to worship more remote, pervasive, and abstract forces of Nature which appear to him to exercise an ultimate control over the creatures that can be directly harnessed to Man's service; and these path-finding hypotheses—correct or erroneous—of the burgeoning Scientific Mind breed worships of a Weather, a Nile, and a Sun that manifestly decide the fortunes of the pastures and the fields, and a worship of stars whose courses apparently determine the course of terrestrial events. These idolatrous cults of cosmic forces are intellectually sophis-

⁵ See III. iii. 256-9.

ticated versions of a primitive idolatrous worship of particular non-human creatures; but, as Man gains in power, he transfers his devotion to a different, and a more sinister, idol when he begins to worship the collective organization of human activities through which he mobilizes his Science and Technology for the subjugation of the Material Universe. The original style of Man's corporate self-worship is parochial: he begins by worshipping a personification of his tribe (Athênê Poliûchus or Fortuna Praenestina) and the genii of his household (the Hebrew Tera-phim and the Latin Lares et Penates). The ultimate style is oecumenical: he ends by worshipping a mundane human saviour with the sword¹ who is the god incarnate of a universal state.

These two types of idolatry that are spiritual by-products of Man's mundane success both have the same inauspicious effect of putting Man out of communion with the One True God by diverting Man's devotion from the Creator to the creature and screening the Beatific Vision behind an idolized creation;² and the short history of Man's mundane progress up to date had already shown, a number of times over, that the demoralizing spiritual effect of this idolatry was Man's Achilles' Heel. If Man's progress in technology, science, and social organization accounted for the geneses and growths of civilizations, his concomitant spiritual infirmity accounted for their breakdowns and disintegrations; and, if this had been the end of the story, human life on Earth would indeed have been 'nasty, brutish and short'.³ Happily for Man, God's providence had offered him grace to find a cure for his spiritual sickness in the very direness of its consequences and to re-enter, as a spiritual adult, schooled by the creative experience of suffering, into a communion with his Maker which he had once enjoyed as a spiritual child in the primeval chapter of the history of the Human Race. In the higher religions that had sprung from the civilizations' catastrophes, Man had been re-endowed with the spiritual treasure that he had possessed (if Father Schmidt's thesis was the truth) in the days of his primeval inefficiency and had then jettisoned in his self-centred scramble up the treacherous ladder of material progress.

If this interpretation of the historical background of the higher religions commended itself, it suggested two reflections: the Devil had lost one throw in his perennial wager with God,⁴ but the Devil had not so lost heart as to have given up the game.

The Devil's defeat in a round which had opened with the fall of Pri-

¹ See V. vi. 178-213.

² Mr. Martin Wight notes: 'These types of idolatry have a correspondence with the three covenants of the Judaic-Christian tradition. (i) Nature-worship corresponds with the covenant with Noah, which survived in its pure and pristine form to greet Abraham in the person of Melchisedek the priest-king offering bread and wine (Gen. xiv. 18), but whose corruption and perversion was seen in the Canaanitish idolatry which the Prophets of Israel combatted and in the paganism which St. Paul denounced in Rom. i. 21-25. (ii) Parochial corporate self-worship corresponds with the betrayal and denial of the covenant with Abraham, which had conferred a particular destiny and responsibility on the archetype of all chosen peoples. (iii) Oecumenical corporate self-worship corresponds with the betrayal and denial of the final covenant with the Human Race, revealed by Christ and sealed by His body and blood. This third type of idolatry corresponds, then, theologically to the New Testament doctrine of Antichrist.'

³ Hobbes, Thomas: *Leviathan*, Part I, chap. 13.

⁴ See II. i. 271-99.

meval Man and had ended in the epiphany of the higher religions was attested by the difference in spiritual stature between the Innocent and the Saint. The saintly soul that was the spiritual flower of the higher religions was not, perhaps, in closer communion with God than the innocent soul that, on Father Schmidt's hypothesis, had been the spiritual flower of the primeval dispensation; but, if Christianity was right in holding that a spiritually creative suffering was a human experience in which God Himself had participated in virtue of His incarnation,¹ then the Saint's communion with God, though no closer than the Innocent's, was nevertheless a communion on less unequal terms; and, if in this sense sainthood was the higher form of spiritual attainment, the Devil's defeat in this round was registered in the reflection that the mortified idolator could never have been transfigured into a saint who was a more enlightened and effective servant of God than the Innocent if that primeval worshipper of the One True God had not lost his innocence through lapsing into idolatry.

'All spiritual knowledge "goes in circles", that is to say that it has to do with re-birth, which is itself a return to the beginning on a different psychic level.'²

The measure of the Devil's defeat in this particular encounter with God was given by the fact that the higher religions had not only brought it within Man's reach to re-enter into communion with God on a higher spiritual level than any that had been accessible to Man in his days of innocence; the higher religions had even spoiled the Egyptians by gleaning a harvest from the jungle-growth of Man's idolatrous days of ignorance.³ Yet we have also to recognize and take to heart the no less manifest fact that the severity of these reverses had not driven the Devil to withdraw from the field. At the time of writing, the living higher religions were being challenged by insurrections of civilizations of a third generation which had armed themselves for revolt by evoking potent ideas and institutions from the graves of their dead pagan predecessors.⁴ A fresh advance, of unprecedented swiftness and perhaps unprecedented vigour, in Man's mastery of the Material Universe had launched idolatry on the war-path again; and, in this formidable recrudescence of a once transcended error, Man's corporate self-worship, which was the more pernicious of the two main lines of religious aberration, now had the whole field to itself.

The other type of idolatry, in which Nature had been substituted for

¹ A Christian theologian might object to this attempt at a statement of the Christian belief on this point on the ground that God does not have experiences because God is Being; whereas experience signifies a process of becoming. Yet the same theologian must hold that the Christ 'who suffered' was 'perfect God and perfect man . . . who, although He be God and man, yet He is not two, but one Christ'; and, on these premisses, it is hard for a layman to see how a theologian could assert, without taking, in the act, either a Nestorian or a Eutychian departure from the line of Catholic Christian orthodoxy, that God had not participated in the human experience of suffering when, in the exercise of His almighty power, He had chosen to become incarnate.

God, had borne a fearful crop of wickedness and benightedness in its time; but its reign had been transitory; for Man's progress in the mastery of his environment, which had first brought this type of idolatry into existence, had subsequently swept it out of existence again. A natural phenomenon that Man has deified on an impulse of wonder and gratitude, when he has first succeeded in coaxing it into performing some highly valued service, cannot retain its divinity in his clearer-seeing eyes after it has been thoroughly broken in and domesticated by successive advances in Technology; and the vaster and more elusive forces of Nature that even a latter-day Western Man could hardly aspire to manipulate by his technological 'know-how' had likewise forfeited their illusory divinity as they had become intelligible to Man's scientific understanding. In the darkness before the dawn of the higher religions, Paganism had culminated in the worship, not of the corn-god or the sun-god, but of the man-god Caesar—the incarnate symbol of Man's terrible collective power—and the transformation of Nature from an object of worship into an object of exploitation and investigation had left Man facing the single question: 'Which is God? God or Man?'

The message of the higher religions had been that Man, like Nature, is not God but is God's creature; and this message had won Man's ear at the moment when the collapse of a man-made mundane civilization had been demonstrating to Man the limitations of his power through the first-hand evidence of a painful and humbling experience. But this lesson was readily forgotten when the mundane welfare that was a by-product of spiritual regeneration tempted the Heirs of the Promise to reinvest their treasure in This World. In the second Fall of Man there had been no recurrence of Nature-worship, but, for this very reason, a recurrent Man-worship, unchecked and unbalanced, this time, by the claims of any competing idols, was now raging in men's souls with an unprecedented virulence.¹ The Neo-Pagan man-worshipper believed Man to be, not Nature's co-divinity, but Nature's lord the One True God, and, being in this degree more impious than his pristine pagan forerunner, he was in the same degree more lonely—in a loneliness which aggravated itself by driving him into an ever more frantic pursuit of the idolatry that was the cause of it.

'Wandering, as they are, in the wilderness of distracted minds, . . . people everywhere feel insecure. They are no longer rooted anywhere. There is intense and widespread loneliness, . . . [and] they seek comradeship anywhere at any price. The day of the tribe returns. . . . Man is seeking for some strong tribal body, with its tribal leader, to relieve him of the responsibility of making personal decisions . . . and the modern tribe is larger than in the days of old. Now it can be a nation, or the people of a continent, or of continents. In the Western World it represents the retreat of a people who have lost the guidance and support of a higher faith. This emotional regression is a very serious matter in a highly rationalised and artificial environment.'²

¹ The resurgence of Caesar-worship in the Orthodox Christian and Western worlds has been touched upon on pp. 439-40 and 537-9, above.

² Burgmann, *op. cit.*, pp. 14-15.

In this Neo-Pagan worship of a collective Humanity, the higher religions were being confronted with a repetition of the challenge to which they had responded victoriously in the first chapter of their history; and the struggle upon which they were entering in a twentieth-century Westernizing World, threatened to be a sharper ordeal than any to which they had ever before been subjected.

'Ia-ma-nu wearing shields on their heads' in the Babylonian version.⁷ In 'DNa'.

TABLE VI. *A Tentative Reconstruction of Darius's Original Dissection of the Achaemenian Empire into Twenty Taxation Districts*
(following the geographical order adopted in the Concordance, Table V, above)

Location of District	Number in New Order	Number of Herodotus's Gazetteer	Names of Peoples and/or Countries in Herodotus's Presentation	Names of Countries or Peoples in the Official Lists
Southern Media: latter-day Hamadān, Kirmānshāh, Ispahān	1	10	'Agbatana and the rest of Media'	Māda
Central Media: Tabriz, Khamsah, Ardalān (?), Qazwin, Caspian Gates	2	11	Kaspioi, Parthakai, Pantimathoi, Dareitai	
North-Eastern Media: lower basin of rivers Aras and Kur	3	15	Sakai, Kaspioi	
North-Western Media: portion of 'Irāq to the north-east of the Jabal Hamrīn; basins of lakes Urmīyah and Van; upper valleys of rivers Aras, Choroq, Frāt (<i>alias</i> Qāra) Su, Murād Su; middle valley of Kur (?)	4	18	Matiēnoi, Saspeires, Alarodioi	
Khūzistān, Bakhtiyāri-land, Lūristān	5	8	'Sousa and the rest of the country of the Kissioi'	Hūja
Southern Afghanistan, the Darajāt, Kirmān, Lāristān	6	14+13	Thamanaioi (14), <i>alias</i> 'the Pactyan country' (13), Sagartioi, Outioi, Mykoi, <i>déracinés</i> planted in islands in Persian Gulf	Harahvatiš, Asagarta, Maka
Persian and Pākistānī Baluchistān	7	17	Parikanioi and Asiatic Aithiopes	Parthava, Haraiva, Zrāka, Var-kāna, Dahā, Hvārazmīš
Khurāsān, Herāt, Seistan, Gūrgān (Astarābād), Western Transcaspia, Khwārizm (Khiva)	8	16+14	Parthoi, Areioi, Sarangai (14), Khorasmioi	
Upper basin of River Oxus (Amu Darya) and basin of River Zarafshān, as far to the north-east as the southward elbow of River Jaxartes (Syr Darya), together with Merv oasis	9	12+16	'the Baktrianoi as far as the Aiglai' [implicitly including the Sogdoi (16)]	Bākhtriš, Suguda, Marguš
Oxus Delta and steppes to the north-east of Lower Oxus and astride Middle Oxus	10	10	Orthokorybantioi	Sakā Tigrakhaudā
Kābul River basin and Northern Panjab	11	7	Gandarioi, Dadikai, Aparytai, Sattagy dai	Gādāra, Thataguš
Southern Panjab, Multān, Bahawalpur, Sind	12	20	Indoi	Hiduš
'Iraq as far to the north-east as the Jabal Hamrīn	13	9	'Babylon and the rest of Assyria'	Bābiruš
Mesopotamia (the Jazīrah), Syria, Jordan, Lebanon, Israel, Cyprus	14	5	'The Whole of Phoinikē and the so-called Philistine Syria and Cyprus'	Athurā
Egypt and Cyrenaica	15	6	Egypt, Libyes, Kyrēnē, Barkē	Mudrāya, Putāyā
Upper Tigris basin and north-west corner of Euphrates basin	16	13	Armenioi	Arminiya
Eastern section of Black Sea seaboard of Anatolia	17	19+13	Moskhoi, Tibarēnoi, Makrōnes, Mossynoikoi, Māres, <i>alias</i> 'the adjoining peoples as far as the Black Sea' (13)	
Northern and Central Anatolia, extending as far to the north-west as the Anatolian shores of the Bosphorus, Sea of Marmara, and Dardanelles, as far to the south-west as the headwaters of the River Maeander, and as far to the south-east as Lycaonia	18	3+13	{ Syrioi, <i>alias</i> 'the Pactyan country' (13) [i.e. Kappadokiē], Paphlagonēs, Mariandynoi, Asiatic Thrākes, Phryges, Hellespontine Hellenes	Katpatuka
South-Western Anatolia, excluding the seaboard	19	2	Mysoi, Lydoi, Lasonioi, Kabalioi, <i>alias</i> Kabēlees, Hygenees	Sparda
The western and south-western seaboard of Anatolia	20	1	Iōnes, Asiatic Magnētes, Aiolees, Kāres, Asiatic Dōriees, Lykioi, Milyai, Pamphyloi	'The Yaunā on the Mainland', Karkā
Districts Subsequently Added				
The Aegean Archipelago (intended to expand over maritime transmarine Hellas, as far to the west as Magna Graecia and Sicily)	21	..	Isles	'Those in the Sea', <i>alias</i> 'the hatted Yaunā'
Thrace, the Maritsa basin and the Lower Danube basin	22	..	'The inhabitants of Europe as far as Thessaly'	{ 'Those beyond the Sea', <i>alias</i> 'the Sakā beyond the Sea'
Macedonia (intended to expand over Continental European Greece)	23			
Countries Externally Associated with the Achaemenian Empire				
Farghānah	..	10	Sakai Amyrgioi	Sakā Haumavargā
North-western Arabia, touching the south-east corner of the Mediterranean Sea and bestriding the Euphrates between Syria and 'Irāq	Arabioi	Arabāya
Nubia and the Eastern Sūdān	Aithiopes marching with Egypt	Kūša
Western Transcaucasia	'The Kolkhoi, and the adjoining peoples as far as Mount Kaukasis'	The Ākaufačiyā
South-eastern Anatolia, from the country astride the River Qyzyl Irmāq, just above its southward elbow, as far to the east as the right bank of the Euphrates and as far to the south as Cape Basit on the coast of Syria to the south of the mouth of the Orontes	..	4	Kilikies	—

TABLE VII. *Correspondences between Higher Religions and Psychological Types*

<i>Religion</i>	<i>Predominant Attitude</i>	<i>Predominant Faculty</i>	<i>Auxiliary Faculties</i>	<i>Religious Expression of Unrepressed Psychic Elements</i>	<i>Repressed Attitude</i>	<i>Repressed Faculty</i>	<i>Religious Expression of Repressed Psychic Elements</i>
Hinduism	Introversion	Thinking	{ Sensation Intuition	{ Hindu Ritual Hindu Mysticism	Extraversion	Feeling	{ Extraversion has found a limited expression in the worship of personal epiphanies of an impersonal Ultimate Reality (the avatars of Vishnu); feeling has found expression in the worshipper's devotion to the god of his choice (<i>bhakti</i>).
Christianity	Extraversion	Feeling	{ Sensation Intuition	{ The Eucharist Christian Mysticism	Introversion	Thinking	{ Introversion has found an incomplete expression in the Protestant's psychological experience of 'being saved'; thinking has found a limited expression in Christian theology.
Islam	Extraversion	Sensation	{ Thinking Feeling	{ The Sunnah The Shī'ah	Introversion	Intuition	{ Introversion has found a limited expression, but intuition has found a full expression, in Islamic Mysticism.
Buddhism	Introversion	Intuition	{ Thinking Feeling	{ The Hīnayāna The Mahāyāna	Extraversion	Sensation	{ Extraversion has found expression in the Mahayanian metamorphosis of bodhisattvas into personal gods; sensation, in the fetish worship of relics.

VIII

HEROIC AGES

A. THE GENESIS OF A *LIMES*

IN the two preceding Parts of this Study we have been concerned with universal states established by would-be saviours arising in the Dominant Minority¹ and with universal churches created by the Internal Proletariat.² Our subject in the present Part is the character of the so-called 'heroic ages' that are episodes in the brief lives of barbarian war-bands.

In another context³ we have already acquainted ourselves with the conditions under which such 'heroic ages' are generated. We have seen how, when a growing civilization breaks down through the deterioration of an attractively creative into an odiously dominant minority, one of the effects of this sinister change in the broken-down society's leadership is the estrangement of its former proselytes in the once primitive societies round about, which the civilization in its growth stage was influencing in divers degrees by the effect of its cultural radiation. The ex-proselytes' attitude changes from an admiration expressing itself in mimesis to a hostility breaking out into warfare; and we have seen⁴ that this warfare between a disintegrating civilization and its alienated external proletariat may have one or other of two alternative outcomes.

On a front on which the local *terrain* offers the aggressive civilization the possibility of advancing, at the militant barbarians' expense, up to a 'natural frontier' in the shape of some unnavigated sea or untraversed desert or unsurmounted mountain range, the barbarians, thus caught in a confined space and compelled to fight with their backs to the wall, may be decisively subjugated or annihilated. But, on fronts where the accidents of the *terrain* do not thus conspire with the prowess and policy of the civilization to bring a definitive victory within its grasp, geography is apt to militate in the barbarians' favour; for, where the retreating barbarian has open to him, in his rear, an unlimited field of manœuvre, the shifting battle front is bound, sooner or later, to arrive at a line at which the aggressive civilization's military superiority—however great this may have been initially, and however much it may have been increased through the dearly purchased experience of fratricidal warfare⁵—will be neutralized at last by the increasing handicap of the ever lengthening distance of the front from the aggressor's base of operations.

Along this line, when it is reached, a war of movement will change into a static war without having resulted in any military decision; and, since both belligerents will still be in the field, the Dominant Minority and the External Proletariat will find themselves at this stage in stationary positions in which they will be living side by side, as the former creative

¹ Part VI.

³ Part VII.

⁴ In V. v. 194-210.

⁵ See III. iii. 150-1.

minority and its prospective proselytes were living before the breakdown of the civilization set them at variance with one another. This semblance of a return to a happier previous situation is, however, superficial; for, though the military front has now become stationary, the psychological relation between the parties on either side of it has not reverted from a barren mutual hostility to the previous creative interplay of attraction and mimesis, and there has been no restoration, either, of the geographical conditions under which this cultural intercourse once took place. In its growth stage the civilization gradually shaded off into a surrounding barbarism across a broad threshold which offered the outsider an easy access to an inviting vista within. The change from friendship to hostility transformed this conductive cultural threshold (*limen*) into an insulating military front; and the stabilization of this front, so far from mitigating its sharpness, turns out to have severely accentuated it. The fluid front of a running warfare is neither so definite nor so impassable a barrier as is the military frontier (*limes*) into which the fluid front crystallizes when the stage of stationary warfare is reached.¹ The contrast in configuration and character between an original *limen*-zone and an eventual *limes*-line is the geographical expression of the conditions that generate an heroic age.

An heroic age is, in fact, the social and psychological consequence of the crystallization of a *limes*, and our purpose in this Part is to trace this sequence of events by our customary empirical method of investigation. A necessary background to this undertaking is, of course, a survey of the barbarian war-bands that had breasted divers sectors of the *limites* of divers universal states during the history of Man in Process of Civilization up to date. A survey of this kind has already been attempted in a previous Part.² In that place a considerable muster of barbarian war-bands has been reviewed, and, in passing, we have also there taken note of their distinctive achievements in the two fields of sectarian religion and epic poetry. In our present inquiry this foregoing survey can be drawn upon for purposes of illustration without having to be recapitulated.

¹ See V. v. 208. Ibn Khaldūn defines the frontier of an empire as the line at which the imperial government's authority peters out. 'A dynasty is much more powerful at its seat of government than it is at the extremities of its empire.' He compares the loss of energy in the radiation of its power to the gradual dying away of rays of light streaming out from some central point, or of the circular ripples which spread over the surface of a piece of water when one strikes it (*Muqaddamāt*, translated by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. 1, p. 332).

² In V. v. 210-337.

B. A SOCIAL BARRAGE

IF the cultural *limen* of a growing civilization is aptly described as the hospitable threshold of an ever open door, the military *limes* of a disintegrating civilization can no less aptly be likened to a forbidding barrage astride a no longer open valley. A threshold is an unassuming piece of work, in which the human architect has been content to take advantage of a suitable surface and gradient that have been provided for him by Nature; a barrage is the imposing monument of a human skill and power that have set Nature at defiance; yet the magnificent barrage is as precarious as the humble threshold is secure; for the defiance of Nature is a *tour de force* on which Man cannot venture with impunity.

"The Arab-Muslim tradition relates that once upon a time there was to be seen in the Yaman a colossal work of hydraulic engineering known as the dam or dyke of Ma'rib, where the waters descending from the eastern mountains of the Yaman collected in an immense reservoir and thence irrigated a great tract of country, giving life to an intensive system of cultivation and thereby supporting a dense population. After a time, the tradition goes on to relate, this dam broke, and in breaking devastated everything and cast the inhabitants of the country into a state of such dire distress that many tribes were compelled to emigrate."¹

In the Islamic historical tradition this story—true or legendary—of the literal building and breaking of a barrage has served to account for the initial impulse behind an Arab *Völkerwanderung* that eventually swept out of the Arabian Peninsula with an impetus which carried it across the Tien Shan and the Pyrenees. Translated from this literal rendering into a simile, it becomes the story of every *limes* of every universal state.

"With the internal condition of the exterior barbarians the [sovereign of the universal state] has no concern; but the barrier or pale, whether of masonry or of armed men, obviously exerts a pressure of its own. It acts effectively as a dam against which weight accumulates, and so creates a point of pressure for those outside. In the end the barrier breaks, and with the inundation a new situation is created in which new tribal units are broken up, new individuals awake to self-assertion, and a new redistribution of ownership takes place."²

Is this social catastrophe of the bursting of a military dam an inevitable tragedy or an avoidable one? If we are to find the answer to this insistent question, we must analyse the social and psychological effects of the military barrage-builder's imperious interference with the natural course of relations between a civilization and its external proletariat.

The first effect of erecting a barrage is, of course, to create a reservoir

¹ Caetani, L.: *Studi di Storia Orientale*, vol. i (Milan 1911, Hoepli), p. 266.

² Teggart, F. J.: *The Processes of History* (New Haven, Conn. 1918, Yale University Press), pp. 97-98.

up-stream above this artificial obstruction to the normal drainage down the valley bottom; and this effect is inexorable even if we can imagine it to have been unintended and unforeseen. The erection of the barrage thus produces a striking differentiation in the physiography of the drainage basin which was non-existent in the antecedent state of Nature. The intervention of the barrage now transforms the valley immediately above it from dry land into a lake with an area that is determined by the height of the barrage's brim. Up to this level the now pent-up waters of the catchment basin will fill the upper portion of the valley and its lateral ravines, but the resultant reservoir, at its maximum, will have only a limited extent. It can never cover more than a fraction even of its own catchment basin, since it is beyond the builder's power to raise a barrage, sited far down the valley, to the altitude of the head waters of the downflowing streams; and, even if these waters could have been dammed back right up to their head, there would still have remained a vast unsubmerged hinterland. This new and sharp distinction between a now submerged tract immediately above the barrage and a region at the back of beyond which is still left high and dry has already come to our notice in the social application of our hydrographic simile.

In a previous context¹ we have observed the contrast between the revolutionary effect of a *limes* on the life of barbarians within point-blank range of it and the undisturbed torpidity of primitive peoples in a more distant hinterland. The Hyperborean Slavs continued placidly to lead their primitive life in the secluded Pripet Marshes throughout the span of two millennia which first saw the Achæan barbarians convulsed by their proximity to the European land-frontier of 'the thalassocracy of Minos' in the basin of the Aegean Sea, and then saw the Teuton barbarians going through the same experience in their turn, some eighteen hundred years later, as a result of their proximity to the European land-frontier which the Roman Empire drew across the breadth of the Continent between the North Sea and the Black Sea.² The Achæans and the Teutons were convulsed because they each happened to be engulfed in a reservoir created by the erection of a *limes*; the Slavs remained undisturbed because, on both occasions, their physically water-logged habitat happened to be left culturally high and dry.³

¹ In II. ii. 315-22.

² The weakness of this frontier, owing to its inordinate length, has been pointed out in V. v. 591-5.

³ This illuminating conception of the contrast between a social 'reservoir', whose barbarian denizens are decisively affected by the proximity of the *limes* that has dammed back the waters of life, and a more distant hinterland, whose barbarian denizens remain 'unregenerate' because the social influence of the *limes* is ineffective at that longer range, was first expounded by Owen Lattimore in *Manchuria, Cradle of Conflict* (New York 1932, Macmillan), pp. 36-42. The particular instance that gave Lattimore his insight into this generic feature in the human geography of *limites* was the classic case of the Great Wall of China, and the particular stage in the cycle of frontier history at which he first observed and recorded the phenomenon is one at which the 'reservoir' is no longer the undesired menace that it is in the estimation of the *limes*-building Imperial Power, but has become the invaluable *arcenum imperii* of a barbarian successor-state of the empire for whose defence the *limes* was originally constructed.

The barbarian war-lord from a 'reservoir' area who has succeeded in breaking through a *limes* and usurping Caesar's throne finds himself beset by two anxieties: the conquered ex-subjects of the overthrown universal state may revolt against their parvenu barbarian masters; and the 'unregenerate' barbarians in the more distant hinterland and on the

Why are the barbarians in the 'reservoir' area so disturbingly affected by the proximity of a military frontier which is at the same time a cultural barrage? And what is the source of a subsequent access of energy which has enabled them invariably to break through the *limes* sooner or later as a matter of historical fact, whether this break-through is inevitable or is avoidable as a matter of theory? We may find answers to these questions if we follow out our simile in terms of its local Sinic geographical setting.

Let us suppose the imaginary dam that symbolizes a *limes* in our simile to have been built astride some high valley in the region actually traversed by the Great Wall within the latter-day Chinese provinces of Shensi and Shansi. What is the ultimate source of that formidable body of water that we see pressing, in ever increasing volume, upon the dam's up-stream face? Though this water must all manifestly have come downstream from above the dam on the last stage of its journey, the ultimate source of the greater part of it cannot lie in this direction; for the distance between the dam and the headwaters is not very great, and beyond the headwaters there stretches away the boundless Mongolian Plateau, with a dry steppe on its rim and a drier desert at its heart. If this parched region above the dam had been the sole source of the reservoir's water-supply, the present head of water could never have accumulated; and we know, as a matter of fact, that the main source of supply is to be found, not above the dam, but below it: not on the Mongolian Plateau but in the Pacific Ocean.

We also know that water cannot perform the salmon's feat of forcing a passage upstream and vaulting over a weir; and this means that not one drop of the copious supply that has nevertheless succeeded in making its way out of the Pacific into the reservoir can have travelled over the ground in liquid form. In order to rise from sea level to the reservoir's altitude this water must have been transformed by the heat of the Sun from liquid into vapour, been spirited by an east wind over plain and mountain in a volatile cloud, and then been condensed by cold air into rain falling into the catchment basin. Through thus first losing its liquidity and then regaining it, the migrant water deftly turns an adverse

farther side of 'the reservoir' may be tempted by the ease and brilliance of the 'reservoir' barbarians' success to emulate their achievement by pouring through the breach at their heels and trying to snatch a share in the spoils of a derelict world. In these circumstances the ruler of a barbarian successor-state in *partibus civilium* is confronted with the dual task of keeping 'unregenerate' barbarian competitors out and keeping restive civilized subjects down. For both purposes he relies on the military man-power of his comrades who have stayed behind in the reservoir instead of following him through the breach; and these intact reserves of an invading war-band are admirably fitted for performing both duties, since they have retained enough of their pristine barbarian military virtue to be more than a match for a civilized subject population, while they have acquired a sufficient tincture of the culture of their civilized neighbours and subjects to be more than a match for their 'unregenerate' barbarian neighbours and rivals.

In *Inner Asian Frontiers of China* (New York 1940, American Geographical Society), pp. 247-51, Lattimore has developed this concept of a 'reservoir' zone abutting on the outer face of a *limes* by showing that there is a corresponding zone in the rear of a *limes* in which a sub-society of frontiersmen differentiates itself, under the influence of the immediate proximity of the barbarians, from the main body of the civilization which the *limes* both protects and confines. The frontiersmen of the marches and the barbarians of the 'reservoir' zone tend to approximate culturally to one another and eventually to fraternize against both the civilized population of the interior and the 'unregenerate' barbarians in the outer darkness beyond the farther limits of the reservoir. (On this point, see also the present Study, V. v. 459-80, and pp. 14-15, below).

law of gravity to its own advantage; but, like human migrants who take advantage of an estranging sea by temporarily transforming themselves from landlubbers into seamen, the water has to pay a price for its ingeniously contrived passage. The cultural elements of their social heritage that the seafarers take with them on board ship prove to have suffered 'a sea change' by the time when they are landed in the emigrants' new overseas place of settlement;¹ and the physical elements with which the flying water is impregnated suffer a comparable 'sky change' as a result of their journey. The tincture of sea salt is left behind in the process of evaporation which starts the flying water on its travels, and a tincture of rock salt is acquired when the streams begotten by the precipitated rain scour out the ravines in their descent into the reservoir.

The water has accomplished its miraculous aerial voyage, but it is now a different brew from what it originally was; and this physical phenomenon is an accurate and illuminating simile of the psychic phenomenon of the filling of the reservoir of barbarian energy, dammed back by a military *limes*, with the water of life that psychologists call *libido*. The psychic energy that accumulates in the reservoir till its remorseless mounting pressure eventually bursts the barrage is derived only in an inconsiderable measure from the transfrontier barbarians' own exiguous primitive social heritage; the bulk of it is drawn from the vast stores of the civilization which the barrage has been built to protect. This is the source of supply that swells the head of water in the reservoir to a mass that eventually proves too much for the barrage's powers of resistance; and it is one of the ironies of History that the water which then pours through the breach should originally have been supplied by the very region which the cataclysm now devastates. Why has this water returned in a sudden destructive flood and not in a perennial fertilizing stream? The answer is to be found partly in the erection of the *limes* barrage, which has been an audacious human act of interference with the ordinary course of Nature, and partly in the transformation which the migrant psychic energy has undergone in the course of its journey from the cultivated world within the *limes* to the barbarian reservoir beyond it—a transformation that has been Nature's device for surmounting an obstacle which Man has placed in her path.

Some such transformation of psychic energy is, no doubt, the price of every transfer of culture from one society to another; but the degree and the character of the transformation vary with the circumstances in which the transfer takes place.² The psychic transformation is at its minimum when the society that is the transmitting agent is a civilization in process of growth and the receiving reagent is a primitive society in a socially static Yin-state; it is at its maximum when both parties are civilizations and both are in disintegration. The case with which we are concerned in this Part manifestly lies somewhere between these two extremes; for a civilization which is transmitting psychic energy to its external proletariat is a civilization that is in process of disintegration *ex hypothesi*, while on the other hand the barbarians in 'the reservoir' beyond the *limes* are ex-primitives whose psychic resistance to the cultural radiation of the

¹ See II. ii. 84-100.

² See pp. 481-629, below.

adjoining civilization is prompted, not by the positive motive of being up in arms in defence of an alternative civilization of their own, but only by the negative motive of hostility to an alien culture which, in its breakdown, has lost the original savour that once made it attractive to the estranged barbarians' proselyte ancestors.

How is a transformation of psychic energy brought about in any of these diverse degrees? The transforming process is the decomposition of a culture and its recomposition in a new pattern in which the constant component elements will have entered into new relations with one another, even if none of the original elements have been eliminated and no fresh elements have been added. In other contexts¹ we have compared the social radiation of culture to the physical radiation of light, and we shall be reverting to this simile and working out some of its implications in the next Part after this,² in which we shall be concerned with encounters in which all parties are societies of the species here called 'civilizations'. In this place we need merely remind ourselves of three radiational 'laws'.

The first law is that an integral culture ray, like an integral light ray, is diffracted into a spectrum of its component elements in the course of penetrating a recalcitrant object—the degree of this diffraction being proportionate to the degree of the resistance that is encountered.

The second law is that the diffraction of a culture may also occur, without any impact on an alien and recalcitrant body social, and indeed at a stage before the emission of the migrant ray by the emitting society, if, before the time of emission, this society has already broken down and begun to disintegrate. The cohesion and the diffraction of the component elements of a culture are, in fact, the respective symptoms of social health and growth and of social sickness and disintegration. A growing civilization can be defined as one in which the components of its culture—an economic element, a political element, and a third which may be called the cultural element *par excellence*—are in harmony with one another; and, on the same principle, a disintegrating civilization can be defined as one in which these same elements have fallen into discord.

Our third law is that the velocity and the penetrative power of an integral culture ray are averages of the diverse velocities and penetrative powers which its economic, political, and cultural components respectively display when, as a result of diffraction, they each travel independently of the others. In isolation the economic ray is the swiftest and most penetrating, the political ray comes next to it in degree, while the cultural ray is surpassed by both its companions on both criteria. The speed and penetrative power of an isolated political ray, as well as those of an isolated economic ray, are higher than those of an integral ray, whereas the speed and penetrative power of an isolated cultural ray are lower than those of an integral ray in which it is borne on the wings of its two sisters. This is one reason why the diffraction of a culture ray is a social disaster; for the social values of the three elements, as we find when we assess them, are exactly inverse to their capacities for covering distance and for making their way into foreign bodies.

¹ In III. iii. 151-2 and V. v. 199-201.

² On pp. 481-629, below.

In the social intercourse between a disintegrating civilization and its alienated external proletariat across a military *limes*, the diffracted radiation of the civilization suffers a woeful impoverishment in the course of its arduous journey; for the respective states of the two parties conspire with the artificial barrier between them virtually to eliminate all relations except those of war and trade, and, of these two, it is war that plays the predominant role.¹

It is true that the passage of a barbarian personnel through the *limes* into the civilization's domain, first as prisoners of war, then as hostages, next as mercenaries, and finally as conquerors,² is reflected on the economic plane in a counter-flow of money—through the diverse channels of loot, military pay, and subsidies—out of the world within the *limes* into the barbarian 'reservoir' outside; and this money eventually flows back to its source in payment for goods purchased by its barbarian recipients from marchmen-merchants who venture out beyond the *limes* to peddle the wares of Civilization. There have been situations in which a community of transfrontier barbarians has come in this way to play an appreciable part in the domestic economy of the society on which they have been preying. A classic example is the apparent economic effect of the subsidies paid by the Constantinopolitan Roman Imperial Government to Attila (*dominabatur*, A.D. 434–53), the war-lord of a confederacy of Hun Nomad war-bands cantoned in the Hungarian Alföld. This remittance of money in specie from the Imperial Treasury at Constantinople to Attila's *ordu* beyond the *limes* seems to have operated as a roundabout way of transferring purchasing power from the agrarian interests in the Empire, whose taxes provided the means of payment, to the manufacturing and commercial interests, which earned profits by making and marketing goods for purchase by the Huns with the money that they had exacted.³ This commercial intercourse across a military *limes* is, however, apt to be discouraged and restricted by the imperial authorities because the manifest profitableness of the transfrontier trade to the traders on both sides is a plain and pointed indication that, in the social situation created by the erection of a *limes*, the marchmen just inside the barrage may acquire a common interest with the barbarians just outside it in the exploitation of the marchmen's fellow citizens in the interior of the world which the *limes* is intended to protect; and, since a common interest might assert itself in concerted action between marchmen and barbarians which would be a deadly danger to the fenced-in civilization,

'an imperial boundary . . . has in fact a double function: it serves not only to keep the outsiders from getting in but to prevent the insiders from getting out . . . It was necessary to restrict Chinese enterprise beyond the Great Wall . . . because Chinese who ventured too far beyond the Great Wall became a liability to the state; the business in which they engaged,

¹ See V. v. 202–3 and 208–9.

² See V. v. 459–60, and Chadwick, H. M.: *The Heroic Age* (Cambridge 1912, University Press), pp. 445–6.

³ An illuminating and entertaining analysis of this three-cornered economic relationship will be found in Thompson, E. A.: *A History of Attila and the Huns* (Oxford 1948, Clarendon Press), pp. 184–97.

whether farming or trade, contributed more to the barbarian community than it did to the Chinese community. They passed out of the Chinese orbit . . . [and] Chinese who left the Chinese orbit and accommodated themselves to an un-Chinese economic and social order inevitably began either to adhere to barbarian rulers or to practise barbarian forms of rule themselves—to the disadvantage of China.¹

These considerations move an imperial government to restrict the flow of trade between their own marchmen and the transfrontier barbarians; and such trade as there is tends to confine itself to an exchange of imperial specie in barbarian hands for two classes of imperial products: luxuries for the barbarian war-lords and their lieutenants and weapons both for them and for the rank-and-file of their followers.² The trade across the *limes* is, in fact, sickly as well as precarious, while border warfare flourishes perennially because Mars is master of the situation in which a disintegrating civilization and an alienated external proletariat face one another across a static military frontier.

Under these sinister auspices, such selective mimesis of the Dominant Minority by the External Proletariat as does occur takes place on the barbarians' initiative because the barbarians are politically free.

'The needs and motives of the cisfrontier society and state must make concessions to those of the transfrontier peoples. The very act of drawing a boundary is an acknowledgement that the peoples excluded are not under control and cannot be ruled by command.'³

The barbarians show their initiative by transmuting those culture elements that they do accept from the cisfrontier civilization. The lines which this transmutation follows are determined partly by an hostility to the transmitting civilization which makes the barbarian recipients of its cultural radiation disinclined to adopt what they borrow in a form that would stamp it as being a loan from this distasteful source; but this negative motive of aversion is reinforced by a positive incentive to turn a loan to practical account by adapting it to suit the needs of local barbarian life in 'the reservoir'.

The adaptations thus prompted by xenophobia and by utilitarianism go to different lengths in different fields of activity. The cultural products of a psychic energy flowing into a transfrontier barbarian society out of a civilization within the *limes* are modified in the process in some cases only to an extent that does not wholly disguise their exotic origin, while

¹ Lattimore, O.: *Inner Asian Frontiers of China* (New York 1940, American Geographical Society), pp. 240 and 242. See also Thompson, op. cit., pp. 174-6, and the present Study, V. v. 471-6.

² Classic instances are the Roman weapons of the Imperial Age that have been found by Modern Western archaeologists in graves and hoards in the North European hinterland of the Continental European Roman frontier, and the Greek luxury goods (some of them manufactured especially to suit the taste of this particular barbarian market) that have been found in tombs of the Scythian Age in the Great Western Bay of the Eurasian Steppe. In the social structure of the Hun Power in the Hungarian Alföld in Attila's day the importation of luxury goods was as important from the political point of view as the importation of arms from the military; for the effectiveness of Attila's authority depended on the loyalty of his lieutenants, and his ability to retain their loyalty was dependent, in its turn, on his being able to put them in possession of luxuries which were symbols of wealth and honour in Nomad eyes (see Thompson, op. cit., especially pp. 170-1 and 176-7).

³ Lattimore, op. cit., p. 243.

in other cases the transmutation goes so far as to be equivalent to an original act of creation through which the barbarians make the borrowed psychic raw materials completely their own spiritual property. Examples both of recognizable adaptations and of virtually new creations have been given already in a previous survey which need not be recapitulated. In this place we need only remind ourselves that the 'reservoir' barbarians are apt to borrow the higher religion of an adjoining civilization in the form of a heresy¹ and the Caesarism of an adjoining universal state in the form of 'an irresponsible type of kingship, resting not upon tribal or national law . . . but upon military prestige,' . . . in which 'the king and his *comitatus* form the nucleus of the organism',² while the barbarians' capacity for original creation is displayed in heroic poetry³ and in a pantheon that is the Olympian counterpart of the human *comitatus* of a barbarian war-lord.⁴

These creative achievements of a barbarian society beyond the pale of a disintegrating civilization are impressive; yet the cunningly re-minted metal still bears a tell-tale mark of its alien origin. The cultural

⁴ See V. v. 230-3 for barbarian pantheons in general; p. 232 for the pantheons of the Achaeans, the Scandinavians, and the Aryas; p. 233 for the pantheon of the continental Teuton barbarians beyond the European frontiers of the Roman Empire; and pp. 328-32 for the religious teaching of the prophets who arose, in the eighteenth and nineteenth centuries of the Christian Era, among North American Indians whose traditional way of life was being destroyed by the impact of invaders from the European side of the Atlantic. These American Indian barbarian religions were noteworthy, as we have observed, in being gospels of non-violence in response to the aggression of the Indians' European assailants.

products of the transfrontier barbarian are scarred by that 'schism in the soul' which the malady of social disintegration brings with it as its counterpart and concomitant.¹ In the psychological revolution which coins Barbarism out of Primitive Human Nature, the traditional harmony of Primitive Life in its static Yin-state is disrupted into a tension between the two poles of a more sophisticated individualism and a likewise more sophisticated sense of unity.

¹ See V. v. 376-568 and vi. 1-168.

C. THE ACCUMULATION OF PRESSURE

'The Wreckful Siege of Battering Days'

THE *limes* that lies open between the domain of a growing civilization and the homelands of its barbarian proselytes is like a gentle tree-clad slope on which the roots preserve the soil from erosion, so that the descending waters seep through gradually without scouring out gullies and pouring down them in torrents. This landscape is weather-proof, and it is consequently an insurance against a cataclysm so long as it is not convulsed through the civilization's breaking down. By contrast, a static military frontier between a disintegrating civilization and its alienated external proletariat is intrinsically impermanent. The barrage is doomed to burst sooner or later. Premonitions of its ultimate fate are to be found in the avalanches of barbarian counter-invasion which are apt to descend on a civilization in the course of its history, before the establishment of its universal state, on fronts where its representatives have first extended its bounds by force at the adjoining barbarians' expense and have then broken off their offensive without having arrived at a 'natural' frontier.¹

The social barrage created by the establishment of a *limes* is subject to the same law of Nature as the physical barrage created by the construction of a dam. When Man's obstruction of such a natural drainage system has brought into existence two artificially separated bodies of water at two different levels, this human interference with Nature provokes on Nature's side an impulse to correct it. The water piled up above the dam seeks to regain a common level with the water below the barrier, and the degree of the consequent pressure is determined by the quotient of the difference in height between the two levels and the mass of the water held at the higher level of the two. In the structure of a physical dam the engineer introduces safety-valves in the form of sluices which can be opened, to whatever the necessary extent may be, whenever the pressure of the head of water in the reservoir threatens to exceed the limits of the dam's capacity to resist it; and this obvious device for safeguarding the dam against catastrophe by providing for a regulated release of the pent-up waters is not overlooked by the political engineers of a military *limes*, as we shall see. In this case, however, the attempted remedy merely precipitates the cataclysm that it is designed to forestall, for the social and psychological materials of which a *limes* is constructed are so frail and friable that, if once this sandstone masonry is breached, the outpouring waters of barbarian energy quickly sweep the whole structure away. In the maintenance of a social barrage the relief of pressure by a regulated release of water is, in fact, impracticable; there can be no discharge from the reservoir without the barrage being destroyed; and, since, from the moment when the barrage is erected, the head of water above it keeps on accumulating inexorably *ex hypothesi* through the transfer of energy from the civilization below the barrage

¹ For examples of such barbarian avalanches, see V. v. 209, n. 3.

and its transformation into barbarian energy in the reservoir above, sooner or later the time is bound to come when breaking-point will have been reached, and at that juncture a catastrophe will inevitably occur.

The day of doom may be postponed by attempts to strengthen the structure of the barrage as an alternative to the impracticable expedient of piercing it with sluices; but this cruder countermeasure can at best put off the evil day without being equal to averting it; for, as we shall also see, each arithmetical increase in the pressure of transferred and transformed energy upon the *limes* increases the cost of proportionately reinforcing the barrage by a geometrical progression. In this race between attack and defence, the attack cannot fail to win in the long run; and thus, on a static *limes*, Time works inexorably on the barbarian's side, as we have observed already by anticipation.¹ This 'law' also signifies, however, that it does take time for barbarians barred out by a *limes* to achieve their inevitable eventual break-through into the long-coveted domain of a disintegrating civilization which looks to them like an earthly paradise so long as 'distance lends enchantment to the view'.² 'A long period of "education", in which a semi-civilized people has been profoundly affected from without by the influence of a civilized people,'³ is the necessary prelude⁴ to the 'heroic age' in which the barbarians have their fling when a sagging and tottering *limes* at last collapses.

The Impracticability of a Policy of Non-Intercourse

Thus the erection of a *limes* sets in motion a play of social forces which is bound to end disastrously for the builders; and, for them, the only way of avoiding ultimate disaster would be to preclude this fatal course of events by insulating completely from one another the two incompatible societies whose respective domains the *limes* artificially demarcates. A policy of non-intercourse is, indeed, the counsel of perfection in the mind of any imperial government that is burdened with the responsibility for keeping a *limes* in being. In practice, however, an arbitrarily drawn military barrier can never perfectly or permanently produce the effect of a 'natural' frontier provided by some untraversed

¹ In V. v. 209.

² Campbell, Thomas: *Pleasures of Hope*, Part I, l. 7.

³ Chadwick, *The Heroic Age*, p. 458.

⁴ Apropos of the Serb heroic age at the climax of an Orthodox Christian Time of Troubles, after the collapse of the Bulgarian and East Roman Empires and before the imposition of a *Pax Ottomanica*, Chadwick points out in op. cit., on p. 448, that, 'here again . . . , as in the Teutonic and Cumbrian heroic ages, we have the case of a semi-civilized and "juvenile" nation exposed for a long period to the influence of a civilized but decaying empire'. Chadwick has, in fact, established an historical 'law' to the effect that the precipitation of an heroic age is normally the cumulative effect of the radiation of a decaying civilization into a primitive society over a period of time that is to be measured, not in years, but in generations. Since the publication of Chadwick's *The Heroic Age* in A.D. 1912 it had, however, been demonstrated by Hitler that a diabolically perverse process of mis-education can artificially produce the same psychological effect in a community that has advanced as far along the path of civilization as pre-Nazi Germany, and that, under these artificial conditions, the process of barbarization can be so greatly speeded up as to be 'telescoped' into the span of a single generation. The deliberate uprooting of the boys and youths of Nazi Germany from the habit, expectation, and love of a settled life by the systematic application of Modern Western methods of mass-suggestion had evoked a caricature of an heroic age by a process of 'speeding-up' that was a counterpart, on the psychological plane, of the visual effect produced by speeding up the display of a film.

sea or desert or mountain-range, because the wardens of the *limes* find themselves unable effectively to control either the transfrontier barbarians or the cisfrontier marchmen.

'The very fact that the "barbarians" of the excluded territory are always described as aggressive raiders, attackers and invaders shows that geographical limits that appear "natural" and inevitable to one society are not necessarily regarded as geographical obstacles by other societies, which may in fact treat them as merely political obstacles.'¹

And, conversely,

'While the general policy of the [universal] state seeks to establish the limit at which its interests can remain centripetal, and to prevent excessive expansion from passing over into centrifugal dispersion, this policy is resisted and evaded by the particular interests of traders, would-be colonisers, ambitious political and military careerists, and so forth, who see opportunities for themselves across the border. Thus there grows up a nexus of border interests which resents and works against the central interest.'²

A striking illustration of this tendency among the marchmen of a universal state to make common cause with the barbarians beyond the pale is afforded by the history of the relations between the Roman Empire and the Hun Eurasian Nomads who broke out of the heart of the Eurasian Steppe towards the end of the third quarter of the fourth century of the Christian Era and established themselves on the Hungarian Alföld.³ Though the Huns were unusually ferocious barbarians from the back of beyond, and though their ascendancy along the European *limes* of the Roman Empire was ephemeral, a record of three notable cases of fraternization had survived among the fragmentary remnants of the contemporary accounts of this brief episode. Attila's secretary of state was a Pannonian subject of the Roman Empire named Orestes, whose son Romulus Augustulus was to make his name by the facile achievement of being the last Roman Emperor in the West.⁴ The renegade Greek business man from Viminacium whom the Greek historian and Roman diplomatist Priscus encountered in Attila's *ordu* on the Alföld in A.D. 449 has already come to our notice.⁵ This adventurous Greek was not even a marchman by birth. He had migrated to Viminacium, on the Danubian *limes* of the Empire, from the interior of the Hellenic World before being deported beyond the pale when his adopted city was captured by the Huns in A.D. 441. The third member of the trio is 'Eustace, a merchant of Apamea', who, 'about the year A.D. 484, long after Attila was dead, is found accompanying a band of Hun marauders in the role of their chief adviser on a plundering expedition against Persia'.⁶

The Hun Power in Europe came and went too quickly for this fraterni-

³ The occupation of the Alföld by the Western Huns is dated tentatively on the morrow of the Battle of Adrianople (*commisum* A.D. 378) by Thompson, E. A.: *A History of Attila and the Huns* (Oxford 1948, Clarendon Press), p. 26.

⁴ 'Orestes Pannonius, qui eo tempore quando Attila ad Italiam venit se illi iunxit, et eius notarius factus fuerat' (Anonymus Valesianus, chap. 38, quoted by Thompson, *op. cit.*, p. 163).

⁵ In V. v. 473-4.

⁶ Thompson, *op. cit.*, p. 175, quoting Zachariah of Mytilene, p. 152.

zation between the aggressive barbarians and the renegade children of the civilization that was their victim to produce any lasting historical effect. It is, however, significant that it should have gone to such lengths in so short a time between parties which, at their first encounter, had been poles apart in their respective ways of life; and, in cases in which the barbarian Power with whom the renegades had thrown in their lot had been built on more durable foundations, this unholy alliance had sometimes begotten noteworthy political offspring. The residuary continental European successor-state of the Roman Empire in the West was born of a partnership between Frankish *laeti* and Gallic bishops and landlords who were the local representatives of the Roman Senatorial Order. The Manchu Empire, which provided the main body of the Far Eastern Society with a second instalment of its universal state, was born of a similar partnership between Manchu transfrontier barbarians and Chinese marchmen settled beyond the Great Wall but within the Willow Palisade.¹

Thus the existence of a *limes* always in practice generates social intercourse—and this in both directions—between the parties whom the barrier is designed to insulate from one another. In this intercourse, as we have seen,² war predominates over trade; and war is a relation which is technologically educative in spite of being psychologically estranging. A universal state cannot hold the transfrontier barbarians in check along the line of the *limes* without fighting them, and it cannot fight them without involuntarily training them in its own superior way of doing this sinister work. The art of war radiates more rapidly and penetratingly than any other branch of technique; in the outflow of exports, weapons are apt to arrive earlier and make their way farther afield than non-lethal tools;³ and the imported weapons of an adjoining civilization are copied by barbarian artificers with an adroitness that is proportionate to the eagerness of the demand in the local barbarian market.

The Eurasian Nomad barbarians 'could not arm themselves at all for purposes of large-scale offensive operations without the assistance of imported weapons. . . . Even the Mongols of the twelfth century—a military nation if ever there was one—had to import their weapons, chiefly from China and Khurasan.'⁴ On the North-West Frontier of the British Indian Empire from about A.D. 1890 onwards 'the influx of rifles and ammunition into tribal territory . . . completely changed the nature of border warfare';⁵ and, while the transfrontier Pathans' and Balūchīs' earliest source of supply of up-to-date Western small-arms was systematic robbery from the British Indian troops on the other side of the line, 'there would . . . have been small cause for apprehension, had it not been for the enormous growth of the arms traffic in the Persian Gulf, which, both at Bushire and [at] Muscat, was at first in the hands of British

traders'¹—a striking example of the tendency for the private interests of the empire's subjects in doing business with the transfrontier barbarians to militate against the public interest of the imperial government in keeping the barbarians at bay. 'When these methods failed, there still remained the Kohat rifle factory, owned by Pathans, and situated in the strip of independent territory which separates Peshawar from Kohat.'² 'The possession of arms of precision has also produced a change in Pathan tactics, for, with the exception of certain *ghāzi* rushes, there has been a tendency for the recklessness which characterized the earlier struggles to disappear.'³

The Barbarians' Exploitation of their Civilized Neighbours' Weapons

The transfrontier barbarian is not, however, content simply to practise the superior tactics which he has learnt from an adjoining civilization without proceeding to adapt them to the local *terrain*. *Ex hypothesi* he already has the initial advantage of being at home in a theatre of military operations in which his opponent is a stranger, since the *limes* is situated in barbarian territory which the civilization has occupied, up to this line, by force of arms in an aggressive previous chapter of its history. When the barbarian combines his hereditary mastery of the local situation with a creative adaptation of borrowed weapons and tactics, superior to his own, to suit the local conditions of warfare, he becomes formidable indeed. His best opportunities for putting his civilized adversary at this military disadvantage arise where the local *terrain* displays some strongly pronounced physical characteristic which is unfamiliar and adverse to the civilized belligerent and yet at the same time lends itself to the employment, with adroit modifications, of weapons and tactics that have been borrowed from him by his barbarian antagonist.

For example, on the maritime frontiers of the Carolingian Empire and the Kingdom of Wessex the Scandinavian pirates turned to such good account a technique of shipbuilding and seamanship which they had acquired, perhaps, from the Frisian maritime marchmen of a nascent Western Christendom that they captured the command of the sea and, with it, the initiative in the offensive warfare which they proceeded to wage along the coasts and up the rivers of the Western Christian countries that were their victims.⁴ When, in pushing up the rivers of the British Isles and France, the Scandinavian raiders reached the limit beyond which they could not make their way farther by water even in their shallow and slender dragon-ships, they exchanged one borrowed weapon for another and continued their aggressive campaign on horseback instead of on ship-board, since the invaded countries were stocked with horses for them to seize and they had mastered the Frankish art⁵ of cavalry-fighting as well as the Frisian art of navigation. The Cossack barbarians proved equally ubiquitous and elusive in their attacks on the steppe-empire of the Golden Horde when these river-pirates, lurking on islands among cataracts where the Nomad was out of his element, added

a second string to their bow by also mastering the Tatar art of horsemanship.¹ Conversely the Saka Nomad barbarian invaders of an Hellenic empire in India in the second and the last century B.C. added a second string to their bow by exchanging the saddle for the deck in order to take advantage of the waterways offered to an invader by the River Indus and its tributaries.²

The militarily decisive employment of the horse by sedentary barbarians beyond the frontier of a Nomad steppe-empire had had counterparts in cases of the more usual type in which the Nomad had been the representative of Barbarism and the husbandman the representative of Civilization. The original domestication of the horse appears to have been achieved by Aryan Nomad barbarians from the Transcaspiian fringe of the Great Eurasian Steppe who mounted the Iranian Plateau and broke across it, in the eighteenth or the seventeenth century B.C.,³ into the domain of an Empire of Sumer and Akkad that had been reconstituted by Hammurabi. At this tempestuous first entry of the war-horse upon the stage of History the new-fangled animate weapon makes its appearance, not as a cavalryman's mount, but as a charioteer's tractor; and the two-wheeled battle-car, drawn by a pair of draught-animals under the yoke, is shown by the archaeological evidence to have been a weapon which the Aryan Nomad barbarians had borrowed from the Sumeric Society against which these invaders eventually employed it with such deadly effect.

'In the . . . Early Dynastic reliefs from Ur and Kafajah, and on the famous inlaid "standard" from the royal tombs of Ur, . . . ass-drawn chariots are shown in great detail, with solid wheels made of two half-discs dowelled together against the hub . . . It looks . . . as if the battle-car was an invention of Early Dynastic Sumer and that its use was adopted, with other technological devices such as metallurgy and the shaft-hole axe . . . , by the Indo-Europeans on the northerly fringes of the Kingdom of Sumer and Akkad soon after 2000 B.C., [and was] given added speed and lightness by the use of horses and the invention of the spoked wheel.'⁴

On the Syrian *limes* of the Roman Empire the ground had been prepared for the titanic irruption of the transfrontier Arab Nomad barbarians in the seventh century of the Christian Era by the recent introduction of the war-horse into the Arabian Peninsula some sixteen or seventeen centuries after its arrival in the adjoining 'Fertile Crescent' from its place of origin somewhere in Central Asia.⁵ The less dramatic, yet also momentous, irruption of the Berber Nomad barbarians across the Empire's North-West African *limes* in the preceding century had been a similar consequence of the recent introduction of the camel from Arabia into North Africa.⁶

The most dramatic case in the history of the war-horse in which this weapon had been turned by a barbarian against the civilization from which he had acquired it was to be found in the New World, where the horse had been unknown till it had been imported by post-Columbian Western Christian intruders from the European side of the Atlantic. Owing to this lack of a domesticated animal which, in the Old World, had been the making of the Nomad stock-breeder's way of life, the Great Plains of the Mississippi Basin,¹ which would have been a herdsman's paradise, had remained the hunting-grounds of tribes who followed their game laboriously on foot over these great open spaces. The belated advent of the horse in this ideal horse-country had effects on the life of the immigrant and the life of the native which, while in both cases revolutionary, were different in every other respect. The introduction of the horse on to the plains of Texas, Venezuela, and Argentina made Nomad stock-breeders out of the descendants of 150 generations of husbandmen;² the same potent technological revolution made mobile mounted war-bands out of the Indian hunting-tribes on the Great Plains of North America beyond the northern frontier of the Spanish viceroyalty of New Spain³ and beyond the western frontier of the English colonies that eventually became the United States. In this case the borrowed weapon, mated with a local *terrain* that was ideal for its employment, did not give the transfrontier barbarian the ultimate victory against an adversary equipped with the far more potent weapons of Industrialism; but it did enable him to postpone the day of his final discomfiture and to inflict one signal disaster on the aggressive civilization in the last chapter of this North American frontier's history.⁴

While the nineteenth century of the Christian Era saw the prairie Indian of North America turn one of the European intruder's weapons against its original owner by disputing the possession of the Plains with the aid of the horse, the eighteenth century had already seen the forest Indian turn the European musket to account in a new-fangled warfare of sniping and ambushes which, with the screening forest as the Indian sharp-shooter's confederate, had proved more than a match for the tactics of the Potsdam parade ground, whose close formation, precise evolutions, and steady volleys—designed for polite hostilities on European battle-fields—courted destruction when unimaginatively employed against adversaries who had mated the European musket with the American forest.⁵ In days before the invention of fire-arms, correspond-

¹ See Webb, W.P.: *The Great Plains* (New York 1931, Ginn).

² See II. i. 255-6.

³ The enterprisingness of the nineteenth-century Apaches and Comanches in mounting on horse-back is in piquant contrast to the conservatism of their Spanish antagonists, whom the turn of the century found still using the lance and shield and even the bow-and-arrows—apart from an *élite* armed with fire-locks of a sixteenth-century pattern (see III. iii. 136, n. 1).

⁴ The history of the Indian frontier of the United States is examined further on pp. 630-50, below.

⁵ In thus turning to account the military potentialities of the North American forest the Indians merely postponed the date of their extermination at the hands of their assailants from beyond the Atlantic. If, before the Europeans' advent, they had managed to turn the forest's economic potentialities to account by cutting it down and replacing it by a populous agricultural country-side, they might not merely have postponed their

ing adaptations of the current weapons of an aggressive civilization to the opportunities offered by forest warfare had enabled the barbarian denizens of the Russian forests to bend, without breaking, before the blast of repeated explosions of Nomad aggression from the Eurasian Steppe, and to survive the ephemeral dominions of successive Nomad lords of the Steppe's Great Western Bay, from the Royal Scythians to the Golden Horde.¹ A similar response to a comparable challenge had enabled the barbarian denizens of the Transrhenane forests of Northern Europe to save a still-forest-clad Germany from the Roman conquest that had overtaken an already partially cleared and cultivated Gaul by inflicting on the Romans a decisively deterrent disaster in the Teutoburgerwald in A.D. 9.

The Barbarians' Exploitation of their Native Terrain

The line along which the military frontier between the Roman Empire and the Continental North European Barbarians consequently came to rest for the next four centuries carries its own explanation on the face of it in terms of *terrain* and tactics. It was the line beyond which a forest that had reigned here since the end of the latest bout of glaciation was still decisively preponderant over the works of *Homo Agricola* which had opened the way for the march of the Roman legions from the Mediterranean up to the Rhine and the Danube. This line, however, also happened, as we have observed,² to be the longest alinement that could have been found for a Roman military frontier across Continental Europe by a surveyor perversely seeking to draw the frontier out to the maximum possible length; and, even if the *tracée* had been drawn, not from the mouth of the Rhine to the burdensomely distant mouth of the Danube, but along the shortest line between the Baltic and the Black Sea or between the North Sea and the Adriatic, we may surmise that, in the long run, this hypothetical shortest practicable Roman *limes* in Continental Europe would have suffered the fate that actually overtook the long-drawn-out historic line between Batavia and the Dobruja; for, while it is evident that the burden of maintaining a *limes* varies in weight in proportion to the frontier's length, the fatal weakness of a *limes* is not its length but its stationariness and rigidity, and this weakness, being intrinsic, is irremediable.

On the local anti-barbarian frontiers of the still surviving parochial states of a Westernizing World which, at the time of writing, embraced all but a fraction of the total habitable and traversable surface of the planet, two of the recalcitrant barbarian's faithful non-human allies had already been outmanœuvred by a Modern Western industrial technique. The Forest had long since fallen a victim to cold steel, while the Steppe, from its parkland fringe to its desert heart, had been penetrated by the petrol-driven internal combustion engine of the aeroplane and the terrestrial motor vehicle travelling on the treads of a revolving belt over

doom but have averted it at the price of losing their political independence (see II. ii. 277-8). A thickly settled Central American and Andean peasantry did survive a Spanish conquest.

¹ See V. v. 281-9.

² In V. v. 591-5.

terrain where wheels could no longer convey it. The barbarian's mountain ally, however, had proved a harder nut to crack, and the nineteenth-century Russian feat of taming the Caucasus and twentieth-century French feat of taming the Atlas and the Rif had not yet been emulated by any corresponding domestication of either the western or the eastern rim of the Iranian Plateau. At this date the serried tiers of the Zagros Range, astride a theoretical Perso-Turkish and Perso-'Irāqī frontier, were still serving as fastnesses for wild Kurds, Lūrs, Bakhti-yārīs, and the motley wild highlanders of Fars, while the Sulaymān Range and its ramifications were performing the same service for wild Pathans and Balūchīs who were hardly conscious of a theoretical Indo-Afghan frontier that had been drawn across the map of their homelands in A.D. 1893 and had been inherited in A.D. 1947 from a British Indian Empire by a Pakistan that was one of its three successor-states.

This highlander rear-guard of a Barbarism which, in a ubiquitously Westernizing World, was now fighting with its back to the same advancing wall that it was confronting, had been displaying, in its latest forlorn hopes, an impressive ingenuity in turning to its own advantage, on its own *terrain*, some of the latter-day devices of an industrial Western military technique. By this *tour de force* the Rifī highlanders astride the theoretical boundary between the Spanish and French zones of Morocco had inflicted on the Spaniards at Anwāl in the summer of A.D. 1921 a disaster¹ comparable to the annihilation of Varus's three legions by the Cherusci and their neighbours in the Teutoburgerwald in A.D. 9, and had left their mark on History by making the Romanesque structure of French Power in North-West Africa rock on its foundations in the summer of A.D. 1925. By the same sleight of hand the Mahsūds of Waziristan had baffled repeated British attempts to subdue them during the ninety-eight years that had elapsed between A.D. 1849, when the British had inherited this anti-barbarian frontier from the Sikhs as a penalty for having annexed the Sikh Rāj, and A.D. 1947, when the British had disencumbered themselves of a still unsolved Indian North-West Frontier problem by bequeathing this unwelcome legacy to a fully self-governing Dominion of Pakistan.

In the trial of strength in A.D. 1925 between the Rifī barbarian warlord 'Abd-al-Karīm and the great French soldier and administrator Marshal Lyautey,

'the prospective scene of operations, like the adjoining parts of the Spanish Zone, was an arid treeless country, covered with a thorny undergrowth, broken up by ravines, and cursed with a scanty water-supply; and this was almost an ideal *terrain* for the Rifī forces, who were thoroughly at home in their native environment and at the same time had adopted such elements in the Western art of war as could be employed there to good purpose. Every Rifī fighting-man was an adept at taking cover, and, notwithstanding the brokenness of the country, he was disconcertingly mobile, since he lived in the open and carried no impedimenta except a handful of food, in the hood of his cloak, and his rifle and ammunition. With rifles, machine-guns, and small-arms ammunition the Rifīs had

¹ For details see Toynbee, A.J.: *Survey of International Affairs*, 1925, vol. i (London 1927, Milford), pp. 115-16.

supplied themselves abundantly at the Spaniards' expense; and, although the captured Spanish artillery was clumsily served and there was no air force on the Rifī side, these were luxuries and not necessities under the local conditions. On the other hand the Rifī High Command had not only captured but [had] learnt to utilise field telephones, and by means of these they were able to keep in touch with their widely scattered and constantly moving units, and to execute concerted manoeuvres over as wide a field as their opponents. They appear to have established district depots of rifles and ammunition, to which the tribesmen could be called up at short notice, fitted out, and then dispatched to any point where they were needed. The bulk of their forces was extremely fluid—the men being perpetually called up in relays and perpetually released (as far as the course of the campaign allowed) to work in the fields. Every tribe, however, appears to have been required to supply a permanent contingent, and the tribal levies were stiffened by a small standing army of regulars¹ (mostly drawn from 'Abd-al-Karīm's own tribe, the Banu Wuryāghal of Ajdir) who were uniformly trained and equipped and were in receipt of pay and rations—in consideration of which they had to hand over their booty to the Government.

'The Rifī tactics (which were directed by 'Abd-al-Karīm's brother, Mahammad, the mining engineer, as Commander-in-Chief) were to send forward a screen of irregulars who filtered through the enemy's line and raised the tribes in his rear—if necessary by coercion. By this means the Rifī army grew like a snowball as it advanced, each tribe whose territory became the scene of fighting being called out *en masse*. The tendency towards desultoriness and incoherence, which was to be looked for in an army recruited in this way, was guarded against by placing all the tribal contingents under the command of regulars, but the main body of the regular troops was carefully husbanded and kept in reserve. Advancing behind the screen of tribesmen they dug themselves in, provided a support upon which the skirmishers could fall back, and resisted enemy counter-attacks in hand-to-hand fighting,² with a tenacity which reminded their French adversaries of European warfare.'³

Through this skilful adaptation of tactics to *terrain* the Rifī offensive in the summer of A.D. 1925 came within an ace of cutting the corridor, traversed by a railway, which linked the effectively occupied part of the French Zone of Morocco, along the Atlantic seaboard, with the main body of French North-West Africa in Algeria and Tunisia, and which thereby insulated the still unsubdued Rifis astride the boundary between the French and Spanish zones of Morocco from the likewise still unsubdued *tache de Taza*, immediately south of the French corridor, and from the much larger unsubdued area, farther south again, in the fastnesses of the Atlas. The threat to the corridor at the crisis of the campaign may be said, without exaggeration, to have put in jeopardy the

¹ Estimated at from 6,000 to 10,000 men (*Foreign Affairs of New York*, January 1926).

² 'Marshal Lyautey has found himself in the presence, not indeed of highly scientific armies, but of a remarkable infantry, which is the equal of any infantry in the World in courage, character and marksmanship' (M. Painlevé in the French Chamber, 9th July, 1925). For accounts of the military organization and tactics of the Rifī forces, see *The Times*, 10th May, 1925; *Le Temps*, 21st and 23rd May, and 22nd June; three articles by M. Réginald Kann in *Le Temps*, 7th, 9th, and 13th August; and an article by Signor Luciano Magrini in the *Corriere della Sera*, 30th August.

³ Toynbee, *Survey*, 1925, vol. i, pp. 135-6.

whole French position in the Maghrib; for if the Rifis had broken through they might have raised the Atlas tribes, and such an extension of hostilities would have immeasurably increased the strain on French military resources.

Interests of comparable magnitude were at stake for the British Rāj in India in the trial of strength between the Mahsūd barbarians and the armed forces of the British Indian Empire in the Waziristan campaign of A.D. 1919-20; for, if in this contest the Mahsūds had got the better of the Great Power whom they were audaciously defying, the conflagration might have spread through the length and breadth of the unsubdued country astride the theoretical Indo-Afghan frontier. In this campaign likewise the barbarian belligerent's strength lay in his skilful adaptation of Modern Western arms and tactics to a *terrain* that was unpropitious for their use on the lines that were orthodox for their Western inventors.

'The elaborate and costly equipment which had been invented on the European battlefields of the General War [of A.D. 1914-1918], in operations on level ground between two highly organised armies, was very much less effective when employed against parties of tribesmen lurking in a tangle of mountains.'¹

On the other hand,

'as a fighting man the Wazīr and the Mahsūd, always more particularly the latter, when in his own country, may be classed very high. Agile and enduring, he is possessed on his own hillsides of an astonishing mobility, which is intensified by complete disregard of impedimenta, as well as by a natural hardness that greatly simplifies all supply problems. His skill with the small-bore rifle is considerable, and is only surpassed by a great capacity to exploit the slightest weakness shown by his enemy. Disregard of methods of security on the one hand, a too slavish routine in their enforcement on the other, miscalculations as to time and space, all these faults have been repeatedly penalized by the Mahsūd and Wazīr. The tribesman is gifted with untiring patience and vigilance in observing an enemy when the latter is on the move, a characteristic which makes it extremely difficult to outflank or to surprise him. He is an expert in the attack of detached posts and in the surprise of small parties. This skill may be enhanced by the employment of ruses which can justly be stigmatized as closely akin to treachery.'²

In order to defeat, even inconclusively, transfrontier barbarians who have attained the degree of military *expertise* shown by the Mahsūds in A.D. 1919 and by the Rifis in A.D. 1925, the Power behind the threatened *limes* has to exert an effort that—measured in terms either of manpower or of equipment or of money—is quite disproportionate to the modest challenge from its gadfly opponents to which this ponderous counter-attack is the irreducible minimum of response.

'The maximum fighting strength of the Mahsūds was estimated at 16,000 and that of the Wana Wazīrs (who did not follow the example of

¹ Toynbee, *op. cit.*, p. 557.

² de Wateville, H.: *Waziristan, 1919-1920* (London 1925, Constable), p. 23. Evidence bearing out this appreciation will be found *passim*. There are striking examples on pp. 130, 156, 207-9, and 213. The quotations from this book have been made with the permission of the publishers.

the Tochi Wazirs in submitting) at 7,000; but the effective number of combatants was limited by the number of efficient breach-loading rifles at their disposal, and this was estimated at not more than 8,000 in the case of the Mahsûds and 3,000 in that of the Wana Wazirs. Moreover, the number of small-bore rifles burning smokeless powder which the recalcitrant tribesmen possessed was estimated (even after their capture in May 1919) at not more than 3,500 in all, and this limited the size of the tribal force which would be under arms at any given moment, since throughout the campaign the tribesmen rigidly refrained, in daylight operations, from using rifles burning black powder, in order not to reveal their positions to the enemy. The largest force ever actually assembled at one moment was believed to have numbered 4,500, but this number was quite exceptional.¹

'On the other side the Indian Expeditionary Force numbered 29,256 combatants and 34,987 non-combatants on the 13th November, 1919, and rose to an eventual daily average of 41,800 combatants and 37,900 non-combatants approximately . . . [But] less than a fifth of the total force, and hardly more than a fifth of the combatants, could be included in the Striking Force, which consisted on the 8th November of 8,500 combatants, 6,500 followers, 1,400 horses and equipment animals, and 7,300 transport animals'.²

The four years of arduous fighting between the forces of the British Indian Empire and the barbarians of Waziristan in A.D. 1919-23 were the significantly paradoxical consequence of a Third Anglo-Afghan War in which the barbarian belligerent had been defeated in a nine-days' campaign (9th-17th May, 1919). The Afghan aggressors' performance had been as ignominious as the British victors' had been brilliant;³ but this relatively easy victory over a vulnerably organized barbarian principality⁴ had to be purchased by the civilized belligerent at the cost of a disproportionate effort of the same relative order of magnitude that was afterwards to be exacted by the harder task of chastising the elusive Mahsûds. On the Afghan side the concentration of regular troops at the end of April 1919 was estimated by the British military intelligence at a total figure of not more than 35,260 sabres and rifles,⁵ while on the Indian side 'at one time the strength of the force employed trans-Indus amounted to 340,000 men and 158,000 animals, and it will readily be understood that the maintenance of these numbers with depleted means of transportation was a problem of considerable difficulty'.⁶ The difficulties were increased by an epidemic of cholera and a heat wave,⁷ and by

³ A brief account of this war will be found in Toynbee, A. J.: *Survey of International Affairs, 1920-1923* (London 1925, Milford), pp. 376-84.

⁴ In terms of the barbarian reservoir beyond the *limes* of the Roman Empire on the European Continent the war-bands of Waziristan might be compared with those of the Transrhene German tribes that annihilated Varus's army in A.D. 9, whereas the principality of Afghanistan might be compared with the Bohemian principality of Maroboduus, which was saved from Roman attack in A.D. 6 by the outbreak of a Pannonian revolt, or with the Transylvanian principality of Decebalus, which was conquered by the Romans in A.D. 101-6.

⁵ Dispatch, dated the 1st November, 1919, from General Sir C. C. Monro, Commander-in-Chief in India (printed as Second Supplement to the *London Gazette* of the 12th March, 1920), §§ 20-21.

⁶ Monro, *op. cit.*, § 5.

⁷ See *ibid.*, §§ 16-17.

the size of the theatre of operations. This problem of geographical scale was given prominence in the report of the British Commander-in-Chief.

'During the course of the war our troops were engaged on a front extending along the whole length of the Afghan frontier from Chitral on the north-east to Seistan on the south-west, a total distance of about 1,000 miles; indeed, the fighting front may be said to have extended still further, for our line of communication defence troops on the 300 miles of road between Robat and Rui Khaf were kept constantly on their guard against raids from across the border and were at one time directly threatened by a small Afghan force which was detached from Herat towards the Persian frontier. Never before have simultaneous operations been undertaken on the frontier of India which have covered so wide an extent of front.'¹

The ascertained maximum trans-Indus British strength of 340,000, unlike the estimated Afghan strength of 35,260, included, of course, non-combatants, and the Afghans were thought to have been counting in A.D. 1919 on raising the unsubdued barbarians, on either side of the theoretical Indo-Afghan frontier, whose total strength in a *levée en masse* was estimated at approximately 120,000 rifles. Yet, even if Amānallāh had not been disappointed in this hope (as in A.D. 1925 'Abd-al-Karīm was to be disappointed in his similar hope of raising the tribesmen of the Atlas), and if the forces of the British Indian Empire had had to meet a combined force of 150,000 Afghan regular and tribal irregular barbarian fighting-men, their maximum total number of men employed trans-Indus would still have been more than double the total number of their adversaries; and, if the ratio of non-combatants to combatants in General Monro's force in the spring of A.D. 1919 was the same, or thereabouts, as it was in the expeditionary force that was operating in Waziristan later in the same year,² this immense mobilization of manpower would only have enabled the British Indian Empire to meet the Afghan regular army and tribal levy with a combatant strength that, if the tribesmen had actually risen *en masse*, would have been no more than just equal to the barbarian enemy's combined total.

The most significant point about this disparity between the efforts respectively required of the British and of their opponents on the North-West frontier of India in A.D. 1919 was that the disparity had recently begun to increase, as is revealed by a comparison of the Waziristan campaigns of A.D. 1917 and A.D. 1919 with their predecessors in the series.

'In spite of the ease with which the campaign of 1917 was brought to its conclusion, certain facts were already becoming patent. Whereas in 1860 a single brigade had marched right through Waziristan without grave hindrance, and whereas in 1894 and 1901 widely separated columns were employed with impunity, yet for many years it was beginning to be believed that an invader of Waziristan must employ greater forces and observe greater precautions. Further, just as the Mahsūds were acquiring more rifles of range and precision firing smokeless powder, and also exhibiting greater skill in their use, so the invader was ever inclined to

¹ Monro, *op. cit.*, § 27.

² See pp. 22-23, above.

resort to more scientific equipment and more impedimenta. In addition, public opinion now demanded more comforts for the troops, while a fresh difficulty was accruing out of the increasing number of medical units accompanying any expedition. Circumstances were thus all tending to complicate the transport problem and to augment the size of supply trains. Yet the lines of communication were unquestionably becoming more vulnerable than they were before the tribesmen possessed modern weapons. It was still necessary to employ long convoys of primitive pack transport; even in 1919 motor transport was impracticable above the lower valleys.¹

The same tale is told by the history of the Roman Imperial Army, which had, as we have seen,² to be progressively increased in numerical strength to offset the progressive increase in the military efficiency of the transfrontier barbarians whom it was its duty to hold at bay. When, early in the third century of the Empire's existence, Septimius Severus (*imperabat* A.D. 193-211) added three new legions³ to the thirty that had been maintained since A.D. 83⁴ for the defence of the static frontiers that had been first marked out by Augustus (*imperabat* 31 B.C.-A.D. 14), the consequent additional strain on the Empire's man-power and revenue was not very serious; but it was quite another matter when, early in the fourth century of the Empire's existence, Diocletian (*imperabat* A.D. 284-304) found himself compelled to raise the Army's strength again, and this time from about 300,000 men to about 500,000.

The Besieged Civilization's Inability to Redress the Balance by Recourse to Organization and Technique

In an economically complex civilization with a money economy, any increase in the numerical strength of a regular standing army entails a corresponding increase in the pressure of taxation upon national income. The diversion of an intolerably large, and still insatiably growing, proportion of a dwindling national income to meet rising costs of public services is the most conspicuous of the social maladies that were the death of the Roman Empire in the West in the fifth century and in the Centre and East in the seventh century of the Christian Era; and, while one cause of this cancerous growth of the fiscal burden on the backs of the Roman Imperial Government's subjects was an increase in the personnel of the Imperial Civil Service to fill an administrative vacuum arising from the progressive decay of local self-government,⁵ a second cause—which would probably turn out to have been by far the more potent of the two, if all the relevant figures were known to us—was the increase in the man-power of the Imperial Army which was required in order to meet the increase in the transfrontier barbarians' military efficiency. We do know that, in the annual budgets of the British Rāj in India during the last century of its existence, the cost of defence (which, in practice, meant the defence of the North-West Frontier) was an item that absorbed a disconcerting proportion of the revenue.⁶

⁵ See VI. vii. 59-60 and 166.

⁶ "The most striking feature on the expenditure side of the central budget is the very

Thus, if the chronic warfare between the defenders and assailants of a *limes* is waged in terms of competitive staying power, the defence is bound to collapse sooner or later, since, so far as it is able to hold its own, it can achieve this only by exerting an effort which becomes more and more disproportionate to the effort exacted from its increasingly efficient barbarian adversaries.¹ In this situation there are two obvious courses to which the defence may resort in the hope of arresting, by one means or the other, this progressive deterioration of its own position. It can mobilize for the defence of the *limes* either its own capacity for organization and technique, in which a civilization is superior to its barbarian neighbours almost *ex hypothesi*, or its barbarian adversaries' capacity for taking military advantage of the local *terrain* through which the *limes* runs. These two policies of elaborating its own organization and armaments and of recruiting barbarian man-power are not, of course, mutually exclusive, and a harassed Power behind a *limes* had usually resorted to both in its desperate search for some means of reversing the accelerating inclination of the scales of war in its barbarian opponents' favour which is the inexorable effect of the passage of Time on a frontier where the civilized party is content to remain passive.

In the last struggle for life of an Hellenic Civilization which had never been technical-minded and which had long since lost any faint proclivities in this direction that it might occasionally have displayed in earlier chapters of its history, it was not technique but organization that was called into play by Diocletian in his heroic attempt to solve a problem of defence which had been shown to have become a question of life and death for the Roman Empire by the break-through of the trans-frontier barbarians into the interior of the Empire on all fronts during the anarchic years A.D. 235-84.

Diocletian's solution was to reorganize completely the Roman Imperial system of defence which had been left unchanged in principle during the three centuries that had elapsed since its original institution by Augustus. Augustus's first concern had been to give the Hellenic

high proportion of the expenditure on defence, which, under a scheme introduced in 1928-29, has been stabilised for a period of 4 years at Rs. 55 crores per year. This figure is over 60 per cent. of the total central revenues, and nearly a third of the total net central and provincial revenues of the country taken together' (*Report of the Indian Statutory Commission*, presented May 1930, vol. i (London 1930, H.M. Stationery Office, Cmd. 3568), § 413, p. 362).

¹ The difference in the degree of the effort required from a civilized army and from a barbarian war-band in order to produce an equal quantum of military effect was once expressed in quaintly concrete financial terms by a correspondent of the present writer's in a comparison between the respective performances of the British Army and the Hijāzi Army against the Turkish Army in the General War of A.D. 1914-18. 'From first to last, the military operations of the Hijāzi Army accounted for 65,000 Turkish troops at the cost of less than £100 per head of subsidy, whereas, in the British Army's operations against the Turks, each Turkish casualty or prisoner cost from £1,500 to £2,000' (Toynbee, A. J.: *Survey of International Affairs*, 1925, vol. i (London 1927, Milford), p. 283, n. 2).

Ibn Khaldūn (*Muqaddamāt*, translated by de Slane, Baron Mc.G. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. ii, pp. 92-94), propounds, as a general 'law', a tendency for the burden of taxation in an empire to grow heavier with the lapse of time, but (thinking, as he does, exclusively in terms of empires founded by Nomad barbarians) he attributes this tendency to increasing demands of the imperial government for defraying rising costs of living incurred by the ruling elements. He makes no mention in this passage of rising costs of imperial defence.

World the maximum opportunity of recuperating from the exhaustion produced by a hundred years of social revolution ranking into civil war, and one of his measures for attaining this end had been to reduce to a minimum the swollen armies that had been mobilized for this fratricidal warfare in the last paroxysm of an Hellenic Time of Troubles. Apart from a modest personal body-guard, he had provided in his permanent military establishment for nothing in the nature of a reserve. His troops of the line barely sufficed to demarcate the Imperial frontiers; they were, in fact, little more than a police-cordon; and, for the security of the interior of the Empire, the Augustan régime relied, in lieu of an adequate provision for defence, on the superiority of its professional army over the transfrontier barbarians in military quality and on the awe inspired by Roman power, which might be expected to deter the barbarians from putting the Imperial defences to any serious practical test.¹ By Diocletian's day this hazardously economical security system had long since gone bankrupt; for the military efficiency which the barbarians had been progressively acquiring in the school which the *limes* afforded had eventually given them both the nerve and the skill to break through the cordon confining them; and in such an emergency the Imperial Government's only means of repairing one breach was to risk another by denuding some distant sector of the frontier that happened at the moment to be quiescent. Though the Romans held the interior lines and could avail themselves of easy and rapid water-transport across the maritime heart of their empire for shuttling troops from one breached frontier to another, the system was radically unsound, and Diocletian reformed it by taking a cue which Septimius Severus had given to his successors when he had placed one of his three new legions in reserve at Albano. Diocletian organized a reserve which amounted in numbers to perhaps not much less than two-fifths of the total strength of a military establishment that was perhaps larger by two-thirds than the Severan;² the best units in the Army were assigned to this new force;³ and it was designed to be as mobile as the raiding barbarian war-bands which it was its task to overtake, bring to battle, and destroy.⁴

From the scientific standpoint of a professional soldier, this Diocletianic system of substituting defence in depth for linear defence by organizing a mobile reserve in support of the front line represents a notable advance in the art of war; and it was no doubt partly owing to this military reform that the Empire—which had seemed to be in the throes of dissolution during the half century immediately preceding Diocletian's accession—actually held out for a hundred years longer in the West and for three hundred years longer in the East and Centre. Yet, though the civilian population might find the conditions of the Diocletianic Age a relief from those of the foregoing bout of anarchy, they would have been happy indeed to exchange them for those of the militarily archaic Augustan Principate.

¹ 'The greatness of the Roman People has propagated an awe of them beyond the Rhine and beyond the Empire's established limits' (Tacitus: *Germania*, chap. xxix, § 3, apropos of the relation of a transfrontier Teuton community, the Mattiaci, to the Roman Empire in the writer's day).

² See VI. vii. 323, n. 5.

³ See VI. vii. 322.

⁴ See VI. vii. 323.

The truth is that Diocletian's professionally admirable military reorganization dealt the civilian population a double blow. On the one hand the belated provision of a numerically sufficient mobile reserve accounted for that huge increase in the total military establishment which had, as we have seen,¹ to be paid for by the higher taxation of a lower national income. On the other hand the concentration of the *élite* of the Army in the mobile reserve still further lowered the *moral*, as well as the efficiency, of the cordon-troops (now explicitly called *limitanei*, to distinguish them invidiously from the *comitatenses* serving in the Emperor's counter-war-band); the last pretence of the Army's being able to hold the barbarians at the *limes* was now virtually abandoned; and it came to be taken for granted that the war-zone, in the warfare between the Roman Imperial Army and its barbarian adversaries, was no longer the *glacis* on the barbarians' side of the *limes*, and no longer even the marches of the Empire in the *limes'* immediate rear, but territories in the interior that were the Empire's economic and cultural vitals. The scientifically impeccable watchword of 'defence in depth' was, in fact, a euphemism for glozing over the humiliating and disastrous fact that the civilian producer of the national income, after he had been fleeced once by the Imperial inland revenue authorities to pay for a vast increase in the Imperial military establishment, was now exposed to the additional affliction of being fleeced for a second time by barbarian raiders whom the Diocletianic new-model army could not, after all, prevent from ravaging the Empire's heartlands.²

This attempt to solve the problem of defence by an improvement in organization, which was such a brilliant failure in the military history of the Diocletianic Roman Empire, had brought in better returns to Powers burdened with anti-barbarian frontiers in a Modern Western World. General Sir C. C. Monro's lightning victory over the Afghans in A.D. 1919 was a triumph of organization in a sudden emergency; Marshal Lyautey's gradual pacification of the Atlas highlands between A.D. 1907 and A.D. 1934³ was a still more signal triumph of organization applied to the deliberate execution of a long-term plan; and these are merely two illustrations out of a multitude lying ready to the historian's hand. In the policy of Modern Western imperial governments, however, the resort to organization as a means of redressing an unfavourably inclining balance in the defence of a *limes* was overshadowed by the resort to technique in an age when Western technology was advancing at an unprecedented pace into a previously undreamed-of wonderland of scientific discovery and practical 'know-how'.

In such circumstances the Western parties to the conflict between Civilization and Barbarism might well feel confident of being able to set so hot a pace in the progressive application of technology to border warfare that their barbarian competitors would find themselves run off their

¹ On p. 25, above.

² This is the burden of Zosimus's critique of the Diocletianic reorganization of the Roman system of imperial defence (see VI. vii. 320, n. 6).

³ Marshal Lyautey himself retired in A.D. 1925, nine years before his work was completed by his successors; but the credit for the whole achievement morally belongs to him.

feet. If the barbarian had shown himself able to procure from abroad and even passably imitate at home a relatively simple product of the Modern Western technique, such as an up-to-date breach-loading rifle, was it not the obvious retort for his Western adversary to raise the technological level of competition in armaments from small-arms to artillery, from fire-arms to the aeroplane, and—in terms of the release of atomic energy—from the non-fissile to the fissile type of explosive for the manufacture of bombs? For, even if the barbarian could procure aeroplanes from abroad and could learn to become as skilful an air-pilot as he had already become a marksman, it was hardly conceivable that he could provide for the servicing of aeroplanes, not to speak of installing the plant for manufacturing them, and it was virtually out of the question for him to procure atom bombs from abroad, and quite out of the question for him to acquire and apply the 'know-how' of manufacturing them and detonating them. When Western Man had crowned a century of scientific achievement by discovering how to harness atomic energy to the service of War, it looked indeed as if it now lay in his power (if he could reconcile this with his conscience) literally to annihilate the last surviving rearguards of Barbarism in their last remaining pockets of unsubdued territory—always supposing that these condemned barbarian prisoners of a ubiquitous industrial Western Civilization were not reprieved, after all, by seeing the Western masters of the World destroy one another first in an atomic fratricidal warfare.

This thesis that technique is a winning card in Civilization's hand is forcefully presented in a passage from the pen of a brilliant observer of a campaign in which a Modern Western Power overthrew a barbarian opponent on his own ground by bringing into action against him the Western technique of the Pre-Atomic Age.

'Halfa is nearly four hundred miles from the Atbara; yet it was the decisive point of the campaign; for in Halfa was being forged the deadliest weapon that Britain has ever used against Mahdism—the Sudan Military Railway. In the existence of the railway lay all the difference between the extempore, amateur scrambles of Wolseley's campaign and the machine-like precision of Kitchener's. When Civilisation fights with Barbarism it must fight with civilised weapons; for with his own arts on his own ground the barbarian is almost certain to be the better man. To go into the Sudan without complete transport and certain communications is as near madness as to go with spears and shields. Time has been on the Sirdar's side, whereas it was dead against Lord Wolseley; and of that, as of every point in his game, the Sirdar has known how to ensure the full advantage. There was fine marching and fine fighting in the campaign of the Atbara; the campaign would have failed without them; but without the railway there could never have been any campaign at all. The battle of the Atbara was won in the workshops of Wady Halfa.'¹

By thus availing himself of a modern Western technology's earliest achievement in the field of mechanical transport, a British general who had been trained as a military engineer was able, in A.D. 1898, to reconquer, in little more than six months, an Eastern Sudan whose war-

¹ Steevens, G. W.: *With Kitchener to Khartum* (Edinburgh and London 1898, Blackwood), chap. 3, *ad init.*, pp. 22–23.

like barbarian denizens, in A.D. 1881-5, had thrown off a sixty-years-old Egyptian domination and had signally defeated the hazardously amateur efforts which Egypt's British conquerors had made at the eleventh hour to salvage a crumbling Egyptian régime without having time to employ those scientific methods by which Kitchener was subsequently to retrieve his predecessors' disastrous failures. This victory of a British-built railway over the Madhist barbarians of the Eastern Sudan in A.D. 1898 had been anticipated by the victory of a Russian-built railway over the Türkmen barbarians of Transcaspia in A.D. 1873-86,¹ and that triumph of Western technique in the hands of Orthodox Christian converts to a Western technological civilization was still more impressive than its subsequent emulation by the countrymen of George Stevenson, who might have been expected to be the first in the field in any application of a technical device that was an English invention.

A generation later, when this Western feat of harnessing steam-power had been eclipsed by the more extraordinary feat of harnessing atomic energy, it was a temptation for Western minds to assume that the problem of anti-barbarian frontiers had now been solved decisively by the progress of Western technology up to date. At the time of writing, however, atomic energy had not yet been used for the destruction of either Barbarism or Civilization; and the recent experience of Western Powers in trying to offset their barbarian opponents' skill in adapting the use of Modern Western weapons and tactics to the local *terrain* by bringing into action, on their own side, additional Modern Western weapons, of ever more elaborate kinds, had demonstrated that the elaboration of technique, like the elaboration of organization, carried with it certain inherent drawbacks in addition to the untoward social effect of its crushingly heavy cost to the tax-payer and the untoward educational effect of its initiation of the barbarian into the ever more formidable tricks of his civilized adversary's trade.² These inherent drawbacks to an elaboration of technique might go far towards neutralizing even the military effect of this expedient for redressing the balance of power between Civilization and Barbarism along a static *limes*.

These limitations upon the effectiveness of Technology as one of Civilization's weapons against Barbarism are illustrated by the history of the Waziristan campaign of A.D. 1919-20. At the opening of these operations 'the efficiency of the troops in India had sunk to a lamentably low ebb,'³ and 'it became manifest, soon after the expedition set out, that there was no alternative but to rely on a liberal employment of artillery and on a lavish expenditure of ammunition and of engineer stores to counterbalance the initial lack of skill displayed by the troops'.⁴ In this campaign, in the end, 'the aeroplane, the howitzer, the gun, and the

¹ See V. v. 323, n. 3, and p. 139, below.

² 'The development of any strategic perception or of a more far-seeing or reasoned leading among the frontier tribes is perhaps improbable. On the other hand, should any such tendencies creep into their conduct of war, and should the tribesmen ever, by any chance, be supported by skilled advice, or find themselves in the possession of efficient artillery, numerous machine guns or stocks of grenades and analogous adjuncts of war, the prospect of entering on a campaign of this nature without highly trained troops is not alluring' (de Watteville, *op. cit.*, p. 210).

³ *Ibid.*

⁴ *Ibid.*, p. 91.

grenade' duly 'redressed the balance'¹ which had been inclined in the Mahsūd barbarian's favour by his superiority to the British Indian soldier in individual prowess as a fighting-man using a Modern Western rifle on his own intractable ground. But the British expeditionary force's dependence on an elaborate equipment proved a source of weakness in two respects. In the first place, 'under conditions where the capacity of the transport constitutes a dominant factor, the greater the skill and mobility of the troops, the smaller the amount of stores and of transport required, and the greater the resultant freedom of action in the conduct of the operations.'² The British expeditionary force's dependence on equipment tied it by the leg,³ and in the second place the military advantage purchased at this high cost in loss of mobility was at a minimum on this *terrain*. 'The tactical methods permissible in the great struggle in Flanders' did not 'turn out appropriate to the nature of Indian mountain warfare'.⁴

'Where large masses can be used, where artillery and high explosive predominate, certain tactical processes of a rather crude nature can be employed, and the training of the individual can remain more elementary. . . . But on the Indian frontier the case is very different. In mountain warfare, as it still remains in spite of all progress achieved in modern military equipment, numbers will rarely be present, while the enemy is particularly expert in the use of ground and of the rifle. Those who attack such a formidable fighting man, over *terrain* of his own choosing, must be able to compete with him individually on more or less level terms. Otherwise the handicap becomes too great. . . . The soldier required for frontier warfare must be trained for the end in view.'⁵ . . . The incidents of the campaign of 1919-20 . . . prove in the most unmistakable fashion the value, or rather the absolute necessity, of a very high standard of individual training among all combatant troops employed in a mountain expedition.⁶

The Barbarians' Military Elusiveness and Economic Parasitism

The technique which thus proved to be no adequate substitute for personal skill and prowess on the civilized belligerent's side had a further drawback that was still more disconcerting: its hammer-blows were apt to beat the air⁷ without inflicting any decisive damage on a target which was as elusive and intangible as the armaments brought to bear against it were unwieldy.

While, at the time of writing, it seemed possible, as has been suggested,⁸ that the recent Western invention of the atom bomb might prove physically capable of eliminating once for all a pocket of unsubdued Barbarism, even in trackless mountain country, by literally annihilating all life within the recalcitrant area, it was perhaps doubtful whether even this tremendous weapon, however ruthlessly employed,

⁷ The civilized belligerent's difficulty in deciding upon his military objective—not to speak of attaining it when it has been fixed—is touched upon in de Watteville, op. cit., pp. 89 and 166.

⁸ On p. 30, above.

could exterminate the Nomad barbarians of Arabia and the Sahara who were still eluding effective control by the sedentary Powers that were their nominal sovereigns. The taming of these Afrasian Nomads had been facilitated, as we have seen,¹ by the pre-atomic Western invention of mechanically driven vehicles whose caterpillar tracks could carry them over mud and sand; but the Nomad denizen of the Steppe enjoyed a social advantage in his contest with a sedentary antagonist which could not be impaired by any technical change in the conditions of warfare on his *terrain*. In the past, this Nomad type of transfrontier barbarian had notoriously been the most difficult for the Power behind the *limes* to cope with, because he was unhampered by the possession of immovable property, so that his civilized assailant had no definite objective at which to aim and no power of bringing this mobile enemy to battle by threatening some fixed asset of his which he could not afford to leave undefended. The classical exposition of this invincible elusiveness of the Nomad is given in Herodotus's account of the Achaemenian empire-builder Darius the Great's unsuccessful attempt to incorporate in his dominions the Great Western Bay of the Eurasian Steppe by subduing its Scythian rangers of that day. After marching and counter-marching over the face of the Steppe without coming any nearer to bringing the Scythians to battle,

'Darius sent a despatch-rider to the King of the Scythians, Idanthysrus, with the following message: "You are a queer fellow! I cannot understand why you keep perpetually on the run when you have two alternatives. If you consider yourself a match for my force, for God's sake stop this dodging, stand your ground, and fight; but, if you know in your heart that you are outclassed, then, if that is the position, again I say: for God's sake stop trekking, bring me offerings of earth and water as acknowledgments that I am your lord and master, and then we can start talking." Idanthysrus's answer to this overture was as follows: "Master Persian, I will put my cards on the table. Never in my life have I run away from anybody out of fear—never in the past, and not now from you. What you have found me doing now is exactly what I habitually do in peace-time; I have made no change. And now I will explain, too, why I do not promptly give you battle. The reason is that we possess neither cities that we might be afraid of your capturing nor plantations that we might be afraid of your cutting down, so there is nothing to push us into fighting a pitched battle with you. But, if you really have to be in such a hurry to seek a decision, let me tell you that we do have tombs in which our ancestors lie buried. Now, just you find those tombs and try to desecrate them, and then you will discover whether we shall fight you for those tombs or not. Short of that, we shall not engage you unless we see reason for doing so."²

While the Nomad herdsman on the Steppe thus provides a classical illustration of the transfrontier barbarian's elusiveness, the sedentary highlander barbarian's way of life neutralizes the effect of the elaborate weapons of Civilization to a hardly lesser degree by the same retort of denying them an adequate target. It is true that the sedentary barbarian

¹ On p. 19, above.

² Herodotus: Book IV, chaps. 126-7.

has given some vulnerable hostages to Fortune. The Power behind the *limes* may retaliate for the wild highlander's raids into imperial territory by destroying the offending war-band's villages and burning its crops; and in the Air Age the champions of Civilization could take these punitive measures without having to follow the toilsome and risky traditional course of marching an expeditionary force on foot into the highlander's fastness. They could send over a few aircraft to do, in a few minutes, without hazard to themselves, a stint of destruction that might have cost a ground-force weeks of fighting and hundreds of casualties; yet nothing is gained by any improvement in the technical means of executing a military operation when the operation itself is intrinsically futile in the sense of being ineffective for producing its intended political result; and punitive measures against even a sedentary transfrontier barbarian are apt to achieve the very opposite of their purpose—which is to turn a brigand into a good neighbour.

Depriving the barbarian of one season's crop is an ineffectual measure of coercion so long as the barbarian himself lives to raise another crop next year (as he will, unless the work of destruction is repeated annually); and burning or bombing his house is likewise ineffectual when he is capable of rebuilding this crude structure of wattle and daub, or of unhewn stones plastered over with mud, with his own hands in one winter, during spare months in which he can neither work in the fields nor go on the war-path.¹ This capacity of his for quickly repairing, by self-help, any material damage inflicted on him by the fortunes of war is one example of a general social 'law' that we have encountered in another context.² In warfare between antagonists that are not on an equality in their level of civilization, the more highly civilized belligerent is apt to win victories that are pyrrhic because they leave the victor exhausted, while his less highly civilized opponent is apt to suffer defeats that are

¹ As the writer was penning these lines, he was having a vivid recollection of two meetings of his with a Turkish peasant in a village in Western Anatolia. When this kindly Turk first gave the writer hospitality in his house in the winter of A.D. 1920-1, the house and the whole village were intact, and, when the same host gave the same guest hospitality for the second time in the spring of A.D. 1923, he again had a house in which to receive a visitor, and this house was again surrounded by a cluster of other simple houses of the kind. If the visitor had not happened to know that, since his previous visit, the whole village had been rased to the ground in the last phase of the Graeco-Turkish war of A.D. 1919-22, he would never have guessed that the house in which he was being received on this second occasion was not physically the same house that had given him a night's shelter before. The change that was manifest even to a foreigner's eye was not the loss and replacement of the house but the difference in the spirits of its owner. On the first occasion the Turkish householder had been patently depressed by the experience of living under enemy occupation—the village being at that time on the Greek side of a Graeco-Turkish military front. On the second occasion, which was after the eventual Greek débâcle, the village was free and the householder's spirits were high. 'All is well now, you see', he said. 'Those Greek soldiers are not here any longer. Yes, they burnt the village before they left, and my house with the rest—the house in which I had the pleasure of entertaining you last time you were passing this way. But, you see, we all built new houses for ourselves last winter, and now we have done our spring sowing, so the damage has been repaired and—we are also free men once more.'

The material standard of life in this West Anatolian Turkish village, which seemed primitive to a West European eye, would have seemed lordly to a contemporary Kurd from Dersim or Mahsūd from Waziristan; and thus the ability of this Turkish village community to reconstruct the material basis of its life in a single season gives the measure of the Kurd's and the Pathan's capacity for economic recuperation on their own lower economic level.

² In IV. iv. 393-4.

inconclusive because of the recuperative power that is Nature's compensation for the handicap of backwardness in organization.

The operation of this law as between the East Roman Empire and Bulgaria in the tenth and eleventh centuries of the Christian Era proved to be the key to the subsequent collapse of the victor and revival of his victim, and we noticed in this connexion how, in the General War of A.D. 1914-18 and its immediate sequel, a highly organized Germany remained prostrate owing to the exhausting effect of her barren victories long after a relatively primitive Turkey and Russia had managed to take the field again notwithstanding their recent shattering defeats. The same 'law' can be seen at work in the warfare between transfrontier barbarians and the Power behind the *times*. So long as the people themselves are not physically annihilated—and a transfrontier barbarian has the proverbial nine lives of a cat—the barbarian belligerent cannot be brought to heel by destroying his rudimentary and readily replaceable property. So far from being an effective sanction, this punitive destruction of property has the effect of confirming him in the predatory way of life from which it is intended to deter him; for if the barbarian is exasperated—and, still more, if he is both exasperated and starved through being deprived by hostile military action of the product of even the modicum of peaceful handiwork that he has still been carrying on side by side with a guerrilla warfare that has already become his major occupation—the double pressure of necessity and resentment will move him more than ever to look for his livelihood to the deeds of war instead of to the works of peace.

A consciousness of this 'boomerang' effect of punitive action perplexed the British guardians of the North-West Frontier of India during the last chapter of their stewardship.

'In common with all other peoples in a similar stage of social development, the Mahsûds possessed no organic centres, the destruction of which could so far impair their economic or social welfare as would infallibly bring them to their knees. Makin, one of their main centres of population, in addition to countless other villages, had been devastated during previous campaigns by way of punitive retaliation, yet such measures had never effectually put an end to their perennial acts of brigandage. Fines had been levied, but the tribesmen had continued to retrieve such losses by plundering their weaker neighbours. Rifles had been confiscated (!), yet in the end this measure seemed only to encourage further thefts and murders in order to replace the (not numerous) surrendered weapons. There is a point beyond which reprisals cannot be carried without provoking undue exasperation or else bringing the subjects of this treatment to partial starvation, unless, indeed, the regular forces imitate the Germans when they methodically drove the Hottentots into the Omaheke Desert—there to die of thirst. But on the [North-West] Frontier [of India], even apart from the ethical side of the question, such action is not practicable. . . . The success of any punitive expedition is best gauged by the permanence of the moral impression which it leaves on the uncivilised mind. . . . In the case of the Mahsûds, punitive expeditions had failed to cause the desired moral impression for any length of time.'

¹ de Watteville, *op. cit.*, pp. 92-93.

The ineffectiveness of the expedient of destroying a recalcitrant barbarian's property was indeed demonstrated afresh in the Waziristan campaign of A.D. 1919-20 when a British column at last reached the Mahsūd 'town' of Kaniguram at the cost of nearly twelve weeks' marching and fighting.

'Previous history . . . lends colour to the belief that the Mahsūds were convinced that the Striking Force had now nearly achieved its worst; it might still destroy Kaniguram, but must then retire. These things had happened before, and in any case would not very deeply affect any but the inhabitants of the place itself. The rifles would thus remain, while raiding and looting would eventually make good the losses incurred by the tribesmen during the campaign.'¹

'Much the same difficulty was to be experienced at Wana as had been encountered at Kaniguram. . . . The destruction of towers and of principal houses belonging to those sections [of the Wana Wazirs] known to be hostile was then taken in hand. But such measures did not appear to accelerate the rate of payment of the fine or of surrender of rifles. . . . Moreover, the majority of the more distant tribal sections, inhabiting districts bordering on Afghanistan, are virtually nomads owning no landed property, no dwellings, nor crops. They wander among the mountains of Waziristan and can take refuge across the Afghan border if hard pressed. The problem of bringing these people to submission seemed insoluble.'²

The fact is that punitive measures defeat their own object by accentuating an already prevalent tendency in the transfrontier barbarian's social evolution which is precisely what has made him such an awkward neighbour.³ If the transfrontier barbarian had remained an unmodified primitive man living in the static Yin-state in which the genuinely primitive societies were found as far back in Time as the existing evidence carried a twentieth-century Western historian's knowledge of them, a decidedly greater proportion of his total energies would have been devoted to the arts of peace and a correspondingly greater coercive effect would have been produced upon him by the punitive destruction of the products of his pacific labours. The tragedy of a *ci-devant* primitive society's moral alienation from an adjoining civilization by which it has previously been attracted is that the consequent deterioration of their relation from one of progressive cultural radiation-and-mimesis to one of chronic hostilities leads the barbarian to neglect his former peaceful avocations in order to specialize in the art of border warfare—first in self-defence, in order to save himself from subjugation or annihilation at the hands of a civilization that has turned savage, and later—when his growth in military efficiency on his own *terrain* has gradually reversed the balance of military advantage in his favour—as an alternative means of making his livelihood. To plough and reap vicariously with sword and spear⁴ is more lucrative for the barbarian now that a civilization which has been thrown on the defensive can be mulcted of its wealth by way of either loot or subsidies, and this is also more congenial to him now that the

³ This distinctive social evolution of the transfrontier barbarian has been touched upon by anticipation, in V. v. 230-3, apropos of its reflection in the field of religion.

⁴ See Gilbert Murray's translation of the song of Hybrias—an heir of barbarian Greek conquerors of a Minoan Crete—in III. iii. 87, n. 1.

barbarian has become a warrior first and foremost and has remained only secondarily a husbandman. The barbarian adjoining a *limes* thus ceases to be economically self-supporting and becomes an economic parasite on the civilization on the other side of the military front.¹

A classical illustration of this characteristic economic regression of the estranged barbarian proselyte of a disintegrating civilization is afforded by Tacitus's description of the German denizens of the barbarian 'reservoir' adjoining the Continental European *limes* of the Roman

¹ While this economic retrogression of the barbarian in a 'reservoir' dammed back by a *limes* is one of the general effects of the erection of a *limes* in any physical environment, the effect naturally varies in degree in proportion to the extent of the difference between the regions segregated from one another by the *limes* in point of relative economic attractiveness or unattractiveness. Evidently the 'reservoir' barbarian will be the more prone to seek his livelihood by plundering his civilized neighbour's garden than to seek it by cultivating his own wilderness, the more forbidding the wilderness is, and the more smiling the garden. A case in point is the poverty of the Pathan highlands by comparison with the adjoining lowlands of Afghanistan as well as Pakistan (see Toynbee, A. J.: *Survey of International Affairs*, 1925, vol. 1 (London 1927, Milford), pp. 546-7).

This point is of some importance, because one of the considerations that are apt to decide an empire-builder to draw his *limes* along a particular line, short of having reached 'a natural frontier', is that, along this line, he has found himself at the limit of the area that he can reckon on being able to exploit economically, with profit to himself, by means of the economic technique of which he is master—at whatever stage of technological 'know-how' he may happen to be at the time when he is choosing the line for his *limes*. This last qualification has to be added because a country-side that is economically profitable for a society at one level of economic technique may be economically unprofitable for a society at another level. For the Romans round about the beginning of the Christian Era it was economically unprofitable to saddle themselves either with North European territories in which the post-glacial forest still had the upper hand over a primitive agriculturist's attempts to clear it, or with an Arabian desert which the sedentary husbandman could never hope to dispute with the stock-breeding Nomad. Accordingly the Romans drew their European *limes* just short of the coal-deposits in the Ruhr, and their Syrian *limes* short of the oil-deposits in Arabia.

The Romans did not live to regret this economic blindness of theirs, since their empire came and went before the technique for turning coal and mineral oil to economic account was discovered by the latter-day children of a Western Civilization sprung from the Roman Empire's ruins. On the other hand, there were Modern Western Governments that had had the provoking experience of seeing territories in which they had lightheartedly disinterested themselves, in the belief that they were valueless, turn out to be of inestimable economic value in terms of new technological discoveries. The Powers more or less interested in a latter-day Arabia had no sooner completed the delimitation of frontiers in that peninsula after the General War of A.D. 1914-18 than they were made aware, by the subsequent pioneer work of Western oil-prospectors, that the sub-soil of the deserts which they had been dividing between them by drawing imaginary straight lines on a small-scale non-geological map was oozing with oil. An equally undreamed-of wealth of oil had likewise belatedly been discovered to underlie the surface of lands in the eastern part of the State of Oklahoma that had become the property of Indians descended from 'the five civilized nations' who had been relegated there since A.D. 1825 in the belief that, for the White Man, this was the least desirable piece of country within the whole vast area of the United States. In A.D. 1952 there was a strange irony in the contrast between the respective current economic values of these oil-lands in Oklahoma, to which 'the five nations' had been deported, and the cotton-lands in Georgia, Alabama, and Mississippi, from which they had been evicted. A similar reflection was suggested at the same date in England by the grass-clad solitudes that had replaced, on the Downs, the cultivation which the Roman had once found there in an age when the forest-clad plains of Britain were as inaccessible to the Celtic husbandman as the forest-clad plains of North America were to the Indian hunter at the time of the arrival of the White Man in the New World.

On the morrow of a latter-day Western discovery of the technique of splitting the atom of one particular chemical element, it looked as if a revaluation of the planet's wealth in terms of uranium instead of gold might produce even more sensational surprises; and such surprises were bound to evoke correspondingly poignant regrets in the hearts of the makers of frontiers in a politically divided society embracing the entire surface of the globe.

Empire at a date by which this *limes* had been in existence for about a century and a half and had therefore had time to produce a *limes*' typical social effects. Tacitus affirms¹ that cattle is the Germans' sole form of wealth; but the relative unimportance of agriculture in the German economy of that day, which is implied in this and other passages of the Roman observer's work, cannot have been due to ignorance or even to inexperience.

'Archaeological investigation has now proved that the cultivation of cereals in the North of Europe goes back to the Stone Age. Of still greater importance is the discovery of the representation of a plough with two oxen among the rock-carvings at Tegneby in Bohuslän, which date from the Bronze Age. However sceptical one may feel towards the dates fixed by archaeologists, this discovery shows without doubt that a highly developed system of agriculture was practised in Sweden before the beginning of the Christian Era. Some other explanation of the accounts given by Caesar and Tacitus must therefore be found. What the true explanation is has been clearly shown by a careful examination of the various passages in which these writers refer to the subject.² The growth of the military spirit had led to a neglect of agriculture, as both writers³ expressly state.'⁴

This interpretation of the unimportance of agriculture 'in the economy of those Germans who were within range of Roman observation in Tacitus's day as being evidence, not of an infantile economic backwardness, but of a recent economic relapse from a higher pristine

¹ Tacitus: *Germania*, chap. 5.

² 'During the intervals between bouts of war, [the Germans] spend a little of their time in hunting, but most of it in doing nothing. They give themselves up to sleeping and eating, and it is precisely the bravest and most warlike of them that are the most idle. They leave it to the women, the old men, and the unfit members of the family to look after the home, the household, and the fields, while the warriors laze. It is a curious incongruity in their character that they should so love sloth and at the same time so hate tranquility' (Tacitus: *Germania*, chap. 15).

³ Whereas Tacitus attributes this neglect of agriculture to the Germans in general, without distinguishing in this matter between one Teutonic people and another, Caesar (*Bellum Gallicum*, Book IV, chap. 1; cp. Book VI, chap. 22) attributes it to the Suebi in particular. The method, here ascribed by Caesar to the Suebi, of moving their quarters every year and never cultivating the same piece of land a second time was reminiscent of the primitive agriculture which Modern Western observers had seen practised by Mayas in Yucatan (see II. ii. 418) and by Bantu peoples in Tropical Africa (see II. ii. 26-7). The Suebi were more remote from the Roman *limes* than the kindred Teutonic peoples to the west of them, and the explanation of their slovenliness in agriculture as being an effect of the *limes* is proportionately less convincing. At the same time, the hypothesis that they were recent initiates into the art of agriculture is untenable, in view of the fact that agriculture was long since well established among their northern neighbours in Scandinavia and their north-eastern neighbours in Estonia. A possible alternative explanation is suggested by a passage in Strabo (*Geographica*, Book VII, chap. i, § 3, p. C 291) in which this Hellenic observer in the next generation after Caesar's ascribes to the Suebi a way of life which is not that of primitive cultivators but is that of the Eurasian Nomad stock-breeders. In Caesar's and Strabo's day the Suebi lived in a region between the south-eastern corner of the Baltic Sea and the north-western shore of the Great Western Bay of the Eurasian Steppe which, in the subsequent map of Western Christendom, was to be occupied by Lithuania and Poland; and the local Polish and Lithuanian variety of a Western culture was to be markedly affected by the radiation of cultural influences from an adjoining Nomadic World. Might not the Suebi have previously succumbed, in the same habitat, to the same influences from the same quarter?—A.J.T.

state, is confirmed by Tacitus's own observation that the Ests (Aestii)—who were living then, as now, on the eastern seaboard of the Baltic—'cultivate cereals and the other fruits of the Earth with an assiduity that stands out in contrast to the typical German sloth'.¹ The habitat of these virtuous Estonian husbandmen lay to the north-east of the Teutonic peoples' domain and was thus at a farther remove from the birthplace of agriculture somewhere in South-Western Asia. In travelling from Asia into Europe round the head of the Great Western Bay of the Eurasian Steppe, which was the western tip of Nomad's Land, the technique of agriculture could have reached Estonia only by way of Germany, and the German peoples who had passed the art on to the Ests must once have been not less good husbandmen than the Ests still were when they were observed by Tacitus's informants. When we ask ourselves why Tacitus's Ests should have retained their hold on agriculture while Tacitus's Germans had lost theirs, the obvious answer is that, by comparison with Tacitus's Germans, the Ests were remote, not only from the South-East Asian birthplace of the ancient invention of agriculture, but also from the Central European location of a recently established *limes* of the Roman Empire. While the Germans adjoining this *limes* had had their lives turned upside-down by the experience of living at close quarters with it, the Ests had been left still high and dry on the farther side of the 'reservoir' which the erection of the *limes* had created. The Ests were still industriously practising agriculture for the same reason that explains why the Suebi, Goths, and Swedes were still remaining loyal to a patriarchal form of kingship, in contrast to the political instability which the south-western Germans in the recently created 'reservoir' had been exhibiting when they had abandoned this same traditional form of government, first for an Hellenic-inspired oligarchy and latterly for the likewise Hellenic-inspired dictatorship of a war-lord backed by his war-band.²

Moreover, there is evidence that these north-eastern Germans out of range of the Roman *limes* had preserved not only their pristine political institutions but also the pristine devotion to agriculture that was characteristic of their eastern neighbours the Ests in Tacitus's time. When, some three or four hundred years later, the Germans in 'the reservoir' adjoining the Roman *limes* at last broke through the dam and flooded Gaul and Britain, the social and economic devastation which was the first effect of this cataclysm was followed, after the human flood waters had soaked into the social soil, by an economic advance that was the reward of a new agricultural technique, and this new technique had been introduced by the barbarian invaders. The Frankish and

¹ Tacitus: *Germania*, chap. 45, § 4.

² For the survival of a primitive patriarchal monarchy among the Teutonic peoples out of range of the Roman *limes*, see Dawson, Christopher: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), pp. 79–81, as well as the present Study, V. v. 213, n. 1—citing Chadwick, *op. cit.*, pp. 298–9 (a passage which is based on Tacitus: *Germania*, chap. 44)—and V. vi. 230–2. The interpretation of the war-lord in the barbarian 'reservoir' as a counterpart of the Caesar on the other side of a *limes* will be found in V. vi. 4, n. 4, and on p. 10, above. The general contrast between the revolution that overtakes the transfrontier barbarians of 'the reservoir' and the still undisturbed life of the transreservoir barbarians in a Hyperborean 'back of beyond' has been noticed in II. ii. 315–22, and on p. 4, above.

English war-bands brought with them into Northern Gaul and Eastern Britain the potent mould-board plough which, in the course of the Dark and Middle Ages, was to bring to fruition the latent fertility of heavy North European soils which had been impervious to the light plough used by Celts and Romans. Though, at the time of writing, Archaeology had not yet detected exactly when or where in Northern Europe this revolutionary technological invention had been made, it was manifest that it could not have been introduced into the former north-western provinces of the Roman Empire by transfrontier German invaders in the fifth century of the Christian Era unless these economically regressive barbarians had been able to learn—or re-learn—its use from north-eastern neighbours of theirs whose remoteness from a subversive Roman *limes* had permitted them still to follow their traditional way of life in an age in which the Germans in 'the reservoir' had been demoralized by the military frontier's proximity.
